The important point, however, is that none of these factors, either alone or in combination, needs to accomplish the nearly impossible task of creating unanimous agreement on standards of judgment. The paradox can be very satisfactorily avoided if common frames of reference are widespread but far less than unanimous. Thus the extension in probability terms of Black's and Arrow's original theorem moves us a step closer to understanding the determinants of transitive social orderings based on majority decisions.

Our findings also give us a clue about where to look in the real world for intransitive social orderings. On the one hand, it is relatively fruitless to search for intransitivities where most individual preference orderings can be derived from a single dimension. An empirical example given by David illustrates this situation.[14] David used a simple classroom experiment to derive preference orderings of students for three alternatives dealing with federal aid to schools. Of the total of 69 students, 67 (97.1%) had preference orderings satisfying a common J scale, making the probability of an intransitivity virtually zero under the model used in this paper.

On the positive side, our findings suggest that intransitivities are most likely to occur in unstructured situations, where there are no common guidelines for judging the alternatives, or in situations involving multiple dimensions. For example, intransitivities might be found relatively often when new issues must be resolved. Until discussion creates some consensus or places new issues in the context of earlier disputes, preference orderings may reflect little agreement on the criteria for judging the alternatives. Similarly, the paradox probably occurs more often in *ad hoc* groups, which are less likely to be influenced by the socialization, selection, and discussion factors which contribute to greater uniformity of judgmental criteria. Such groups might be newly formed ones, groups which meet infrequently and irregularly, or groups which purposely bring together many diverse elements. In elections, the paradox may occur most frequently when parties are absent or when the parties vary along two or more major dimensions. Only in situations such as these is the proportion of preference orderings satisfying a common J scale likely to be small enough to allow frequent intransitivities.

Note, finally, that the paradox is most likely if unstructured situations or multi-dimensional structures can be found among small groups of

[13] One can find the total probability of the paradox (within rounding error) by multiplying the corresponding terms in Tables 1 and 2. For example, for $m=3$, $.250\ (.222)+0(.778)=.0555$.

[14] Paul T. David, "Experimental Approaches to Vote-Counting Theory in Nominating Choice," this REVIEW, 56 (1962) 673–676.

people. This does not mean, of course, that the paradox occurs most often among small groups, since agreement on standards of judgment might be reached most easily in such groups. But small groups which are plagued by lack of agreement about how to judge issues are also likely to be visited more frequently by intransitive majority decisions.

APPENDIX

As indicated in the text, the computer time required to generate all possible distributions of m individuals among six rank orders increases rapidly as m increases. Here we demonstrate and justify another routine for calculating conditional probabilities of the paradox. This method was used to calculate the probabilities given in Figure 1 for $m=45$ and $m=95$. We will also use the procedure to show the shape of the curve in Figure 1 as $m\to\infty$.

We are given that x out of m individuals have preference orderings satisfying a common J scale, where $2/3\leqq x/m\leqq 1$. The x individuals are distributed between the two sets of rank orders which satisfy the J scale. The smaller set contains no more than $x/2$ and no less than m-x individuals.[15] We can suppose, without loss of generality (see below), that the common J scale is ABC, and that Set I (defined in the text) contains at least as many preference orderings as Set II. This situation can be illustrated as follows:

All distributions of m individuals satisfying the above conditions

		Number of Individuals			
I scales satisfying the J scale	$\{ABC\}$ $\{BAC\}$	$2x-m$	$2x-m-1$	$2x-m-2$	$[x/2]$*
	$\{BCA\}$ $\{CBA\}$	$m-x$	$m-x+1$	$m-x+2\cdots x-[x/2]$	
I scales not satisfying the J scale	$\{ACB\}$ $\{CAB\}$	$m-x$	$m-x$	$m-x$	$m-x$
		(1)	(2)	(3) $\cdots$	(T)

*This means the smallest integer $\geqq x/2$.

For the individuals whose preference orderings satisfy the common J scale, we assume that $\Pr\{ABC\}=\Pr\{BAC\}=\Pr\{BCA\}=\Pr\{CBA\}=1/4$. This means, of course, that $\Pr\{\text{Set I}\}=\Pr\{\text{Set II}\}=1/2$. It also means that $\Pr\{ABC\}=\Pr\{BAC\}=1/2$ given that the individual is in Set I, and $\Pr\{BCA\}=\Pr\{CBA\}=1/2$ given that the individual is in Set II. For the individuals whose preference orderings do not satisfy the common J scale, we assume that $\Pr\{ACB\}=\Pr\{CAB\}=1/2$.

On the basis of these assumptions, we are now able to calculate, for each distribution $(1),\ldots,(T),\Pr\{A\succ B\},\Pr\{B\succ C\},\Pr\{A\succ C\}$ and their complements. For example, take distribution (1). If $A\succ B$ in the social ordering, at least $[(m+1)/2]-(m\text{-}x)$ of the individuals in Set I must have the rank order ABC. This follows immediately from observing that $(m+1)/2$ is a simple majority, that $A\succ B$ for the m-x individuals in Set III, and that ABC is the only other rank order in which $A\succ B$. Similarly, if $B\succ C$, at least $[(m+1)/2]-(2x\text{-}m)$ of the individuals in Set II must have the rank order BCA; if $A\succ C$, at least $[(m+1)/2]-(2x\text{-}m)$ of the individuals in Set III must have the rank order ACB.

Continuing the example of distribution (1), we now have $\Pr\{A\succ B\}=\Pr\{ABC\geqq[(m+1)/2]-(m\text{-}x)\}$, where the right hand side of the expression indicates the probability that at least $[(m+1)/2]-(m\text{-}x)$ individuals have rank order ABC. Similar expressions can be written for $\Pr\{B\succ C\}$ and $\Pr\{A\succ C\}$. These probabilities can be calculated using the binomial probability distribution. When available, they can be obtained directly from tables of the cumulative binomial distribution. Since $\Pr\{A\succ B\}$, $\Pr\{B\succ C\}$, and $\Pr\{A\succ C\}$ are independent of one another, we can write:

$$\begin{aligned}&\Pr\{A\succ B,B\succ C,C\succ A\}\\&\quad=\Pr\{A\succ B\}\cdot\Pr\{B\succ C\}\cdot\Pr\{C\succ A\}\\&\Pr\{A\succ C,C\succ B,B\succ A\}\\&\quad=\Pr\{A\succ C\}\cdot\Pr\{C\succ B\}\cdot\Pr\{B\succ A\}\end{aligned}\qquad(1)$$

Since these are the only possible intransitivities with three alternatives, we have now indicated how to calculate the probability of the paradox for distribution (1). Similar reasoning applies to distributions $(2),\ldots,(T)$.

[15] The smaller set obviously cannot contain more than half of the preference orderings which satisfy the common J scale. On the other hand, suppose it contained only $m-x-y$ I scales. Then the other two sets satisfy a common J scale, and they contain $m-(m-x-y)=x+y$ individuals. But this is contrary to the assumption that only x preference orderings satisfy a common J scale.

Now let us consider all possible distributions of m individuals among Sets I, II, and III (given that there are $m-x$ in one set). Every possible partition of m individuals (e.g., $m-x$ in one set, $m-x+y$ in another set, and $2x-m-y$ in the third set) is represented by one of the (T) distributions. Moreover, it can be shown that the probability of the paradox is identical when the partition of individuals into sets is the same, regardless of what the J scale is or which set is the largest. Thus we have shown how to calculate the probability of the paradox for each of the (T) partitions of m individuals into the three sets.

However, the number of distributions represented by each partition is not the same. Specifically, one distribution is represented if each set has the same number of individuals. If Set I and Set II, or Set I and Set III or Set II and Set III have equal numbers of individuals, three distributions are represented (i.e., any of the three sets can be the odd size set). If all three sets are of unequal size, six distributions are represented. Hence in order to use distributions (1), . . . , (T) to represent all possible distributions of m individuals among three sets, we need to assign a coefficient of 1, 3, or 6 to each distribution (1), . . . , (T) to denote the number of all possible distributions which it represents.

		Number of individuals	
I scales satisfying the J scale	$\begin{Bmatrix} ABC \\ BAC \end{Bmatrix}$	x	$\Pr\{A \succcurlyeq B\} = \Pr\left\{ABC \geqq \frac{3x+1}{2} - x\right\} = \Pr\left\{ABC \geqq \frac{x+1}{2}\right\}$
	$\begin{Bmatrix} BCA \\ CBA \end{Bmatrix}$	x	$\Pr\{B \succcurlyeq C\} = \Pr\left\{BCA \geqq \frac{3x+1}{2} - x\right\} = \Pr\left\{BCA \geqq \frac{x+1}{2}\right\}$
I scales not satisfying the J scale	$\begin{Bmatrix} ACB \\ CAB \end{Bmatrix}$	x	$\Pr\{A \succcurlyeq C\} = \Pr\left\{ACB \geqq \frac{3x+1}{2} - x\right\} = \Pr\left\{ACB \geqq \frac{x+1}{2}\right\}$

Now we need to calculate the probability of the (T) partitions of m individuals into Sets I, II, and III (represented by distributions (1), . . . , (T) and their coefficients). The number of individuals in one set is fixed at $m-x$. The binomial probability distribution gives us the probability of every possible distribution of the remaining x individuals into two disjoint sets. Here, however, only those distributions represented by the (T) distributions of individuals into Sets I and II are permissible. For each of these distributions, we multiply the binomial probability by the corresponding coefficient. The resulting figure is divided by the sum of the figures for all (T) distributions. This yields the probability of each of the (T) partitions of m individuals into Sets I, II, and III.

Finally, the probability of each partition must be multiplied by the probability of the paradox given that partition. Summing the result across all (T) partitions yields the probability of the paradox given that x of m individuals satisfy a common J scale.

The probabilities displayed in Figure 1 for $m=45$ and $m=95$ were calculated using the above procedure. A short computer program was written to perform the arithmetic calculations. The necessary binomial probabilities for $m=45$ were seven-digit values taken from tables compiled by the National Bureau of Standards.[16] For $m=95$, $\Pr\{A \succcurlyeq B\}$, $\Pr\{B \succcurlyeq C\}$, and $\Pr\{A \succcurlyeq C\}$ were taken from the above source. To determine the probabilities of the (T) partitions, individual terms were calculated from the five-digit values given by the Harvard University Computation Laboratory or were taken from the six-digit values given by Romig.[17] For convenience only the values indicated in the footnote to Figure 1 were used.

Conditional Probabilities as $m \to \infty$. The procedure just described can be used to show the shape of the curve of conditional probabilities as $m \to \infty$. Consider first the probability of the paradox when exactly 2/3 of the individuals have preference orderings satisfying a common dimension. Let $m=3x$, and $2x$ of the preference orderings satisfy a common J scale.[18] The situation can be illustrated as follows:

Since $\Pr\{ABC\} = 1/2$ for the individuals in Set I and x is an odd number (so that there cannot be exactly $x/2$ individuals with preference order ABC), $\Pr\{A > B\} = 1/2$; also $\Pr\{B > A\} = 1/2$. Similarly, $\Pr\{B > C\} = \Pr\{C > B\} = 1/2$ and $\Pr\{A > C\} = \Pr\{C > A\} = 1/2$. Then, $\Pr\{A$

[16] *Tables of the Binomial Probability Distribution*, Appl. Math. Series 6 (Washington: U. S. Government Printing Office, 1949).

[17] *Tables of the Cumulative Binomial Probability Distribution* (Cambridge: Harvard University Press, 1955). Harry G. Romig, *50–100 Bimonial Tables* (New York: Wiley, 1953).

[18] The proof in this paragraph—i.e. when exactly 2/3 of the preference orderings satisfy a common J scale—holds for every value of m which is a multiple of three (and an odd number).

$\succ B,\ B \succ C,\ C \succ A\} = \Pr\{A \succ C,\ C \succ B,\ B \succ A\}$ $= (1/2)^3 = 1/8$. Hence the probability of the paradox is $1/8 + 1/8 = 1/4$.

Now let us show that for a fixed proportion, x/m, of the preference orderings satisfying a common J scale, where $2/3 < x/m < 1$, the probability of the paradox approaches 0 as $m \to \infty$. We are given that x of the individuals have preference orderings satisfying a common J scale. The probability that any one of these x individuals is in Set I corresponds to a Bernoulli trial with $p = 1/2$. From the law of large numbers we know that as x (the number of trials) approaches infinity, the probability approaches 1 that the proportion of individuals in Set I differs from the probability of Set I by no more than an arbitrary number ϵ_1.[19] That is, if $\Pr\{\text{Set I}\} = 1/2$, the number of individuals in Set I will be as close to $x/2$ as we desire, for sufficiently large x. Thus, as x (and m)$\to\infty$, we can assume that the distribution of individuals is as close to the following as we desire:

		Number of individuals
I scales satisfying the J scale	ABC	$x/2$
	BAC	
	BCA	$x/2$
	CBA	
I scales not satisfying the J scale	ACB	$m-x$
	CAB	

Note that:

$$\Pr\{A \succ B\} = \Pr\left\{ABC \geqq \frac{m+1}{2} - (m-x)\right\} = \Pr\left\{ABC \geqq x - \frac{m}{2} + \frac{1}{2}\right\}. \tag{2}$$

Since the individuals who have preference ordering ABC must come from the $x/2$ individuals in Set I, we can rewrite (2) as:

$$\Pr\{A \succ B\} = \Pr\left\{\frac{ABC}{x/2} \geqq \frac{x - \frac{m}{2} + \frac{1}{2}}{x/2}\right\} = \Pr\left\{\frac{ABC}{x/2} \geqq 2 - \frac{m}{x} + \frac{1}{x}\right\},$$

and

$$\lim_{x\to\infty} \Pr\{A \succ B\} = \lim_{x\to\infty} \Pr\left\{\frac{ABC}{x/2} \geqq 2 - \frac{m}{x}\right\}.$$

Now we know that $1 < m/x < 3/2$. Let m/x take on any value in this range. Then $.5 < 2 - m/x < 1$, or $2 - m/x = .5 + \epsilon_2$, where $0 < \epsilon_2 < .5$. Applying the law of large numbers as before, we know that if $\Pr\{ABC\} = 1/2$ for the individuals in Set I and $x \to \infty$, the proportion of individuals with rank order ABC differs from $1/2$ by less than an arbitrarily small number ϵ_3. Now for any given ϵ_2, x can be made large enough that ϵ_3 is smaller than ϵ_2. Thus

$$\lim_{x\to\infty} \Pr\{A \succ B\} = \lim_{x\to\infty} \Pr\left\{\frac{ABC}{x/2} \geqq .5 + \epsilon_2\right\} = 0.$$

Using the same line of reasoning we have:

$$\Pr\{B \succ C\} = \Pr\left\{BCA \geqq \frac{m+1}{2} - \frac{x}{2}\right\} = \Pr\left\{\frac{BCA}{x/2} \geqq \frac{\frac{m-x+1}{2}}{x/2}\right\} = \Pr\left\{\frac{BCA}{x/2} \geqq \frac{m}{x} - 1 + \frac{1}{x}\right\}.$$

Also,

$$\lim_{x\to\infty} \Pr\{B \succ C\} = \lim_{x\to\infty} \Pr\left\{\frac{BCA}{x/2} \geqq \frac{m}{x} - 1\right\}.$$

The range of m/x is the same as before. For any value of m/x in this range, $0 < m/x - 1 < .5$, or $m/x - 1 = .5 - \epsilon_4$, where $0 < \epsilon_4 < .5$. By the same reasoning as above we have:

$$\lim_{x\to\infty} \Pr\{B \succ C\} = \lim_{x\to\infty} \Pr\left\{\frac{BCA}{x/2} \geqq .5 - \epsilon_4\right\} = 1$$

It follows that

$$\lim_{x\to\infty} \Pr\{C \succ B\} = 0.$$

We have now shown that in the limit, one factor of both equations of (1) approaches zero. Thus, for all values of x/m such that $2/3 < x/m < 1$, the probability of the paradox approaches zero as x (and m)$\to\infty$.

PRESIDENTIAL ELECTIONS: AN EXPLANATION OF VOTING DEFECTION*

RICHARD W. BOYD
Indiana University

This paper proposes and tests a modest theory of voting defection, the act of voting contrary to party identification. The relevance of voting defection to popular control of government is clear. Except for the infrequent elections that Key calls "critical,"[1] the identification of people with their parties is very stable over time. The percentage of Democrats and Republicans in the electorate changed only slightly in the four presidential elections from 1952 to 1964.[2] Short term shifts in public attitudes, then, are reflected not in shifts in the distribution of party identification, but in the degree that people vote in accordance with their identification. When they are disenchanted with the President, defection will be high among members of the opposition party and low among members of the party in office. In 1952 people were weary of the Korean War; this weariness was apparent in the massive numbers of Democrats who thought Eisenhower a man capable of ending the conflict and who backed up their convictions with Republican votes.[3] In short, in the rate of defection we have a mirror that reflects popular discontent with the politics of the President. My present concern is to explore some personal attributes of the voters who make up this critical electorate, to augment the propositions surrounding party identification with one explanation of why it is that people vote contrary to their party allegiance.

*For their helpful criticisms of an earlier version of this paper, I would like to thank Leroy N. Rieselbach, Roderick A. Bell, C. Richard Hofstetter, and David J. Hadley. Elton F. Jackson, Alden Miller, and John Gillespie gave the paper close methodological scrutiny. However, I offer this acknowledgment as a note of appreciation, not as an implication of their sanction of the method of analysis.

[1] V. O. Key, Jr., "A Theory of Critical Elections," *Journal of Politics,* 17 (Feb., 1955), 3–18. The notion of critical elections has been broadened to include a whole typology of elections. See Angus Campbell, "A Classification of the Presidential Elections," in Angus Campbell *et al., Elections and the Political Order* (New York: John Wiley and Sons, Inc., 1966), pp. 63–77.

[3] The images of the parties and candidates in the 1952 election are discussed in Angus Campbell, Gerald Gurin, and Warren E. Miller, *The Voter Decides* (Evanston: Row, Peterson and Co., 1954), pp. 41–68.

I. POLITICAL ORIENTATIONS AND CROSS-PRESSURES

In a theory of electoral behavior, we would expect to give a large place to political attitudes. In terms of the immediacy of their impact upon behavior, political attitudes lie close to the voting act. Variables farther back in the causal network relate to voting primarily through the intervening variables of political attitudes. Thus, these attitudes have a high predictive quality.[4]

In *The Voter Decides,* the first major Michigan study, political attitudes are organized under three main heads: attitudes toward parties, candidates, and policies. These factors are explored as they affect both participation at the polls and choice of candidates.[5] The later Michigan studies have not preserved the simplicity of *The Voter Decides'* trichotomy. Rather, a variety of political attitudes are grouped together. One cluster of six attitudes is consistently associated with electoral choice.[6]

But the factors which affect an individual's vote do not always impel him in the same direction. Frequently, these forces are in conflict. From this observation comes the concept of cross-pressures, formulated originally by Lazarsfeld, Berelson, and Gaudet in their study of the 1940 Presidential campaign.[7] The Lazarsfeld

[4] This argument, of course, is the one made in Angus Campbell *et al., The American Voter* (New York: John Wiley and Sons, Inc., 1960), chapter 2.

[5] Campbell, *The Voter Decides.*

[6] Since the 1952 election the multiple correlations of these predictors have varied between .72 and .75. See Donald E. Stokes, "Some Dynamic Elements of Contests for the Presidency," *American Political Science Review,* 60 (March, 1966), 19–28.

[7] Paul Lazarsfeld, Bernard Berelson, and Hazel Gaudet, *The People's Choice* (2nd ed.; New York: Columbia University Press, 1948), p. 56. For a discussion of cross-pressures that places the concept into balance theory, see Ithiel de

study uses cross-pressures primarily as an explanation of the time of voting decision during the campaign and of the level of political interest.[8] In *Voting,* the impact of cross-pressures is extended to the stability of vote intention during the campaign, its relation to the selective perception of political events, and to participation at the polls.[9] A major concern of *The Voter Decides* is cross-pressures—the consistency and conflict of political orientations and their impact on candidate preference and participation.[10]

With the development of the concept of party identification in the Michigan studies, we also see the impact of cross-pressures on voting in accordance with party affiliation. Indeed, cross-pressure remains one of the few concepts used to explain voting defection.

> . . . the influence of party identification on perceptions of political objects is so great that only rarely will the individual develop a set of attitude forces that conflicts with this allegiance. But when other antecedent factors lead to evaluations of the elements of politics that strongly contradict the individual's party identification, we anticipate that behavior will conform to these evaluations rather than to party allegiance.[11]

That people develop political attitudes which conflict with party identification should not startle us. Party identification is usually acquired early in life—well before more specific attitudes about policies or candidates.[12] Further, this identification is usually the most enduring of our political beliefs. Our more specific political values are vulnerable to change, to the influence of new peer groups created by social or geographical mobility. At some point the estrangement of political beliefs from party allegiance may become so great that consistency is regained by switching party allegiance. We can get a glimpse of this process in the South today. But even in the South, where mobility and the revolution in civil rights are straining traditional ties, identification with the Democratic Party remains strong.[13]

Following *The Voter Decides,* political orientations are here subsumed under three inclusive heads: images of parties, images of candidates, and policy beliefs. Each of a voter's attitudinal orientations is measured in terms of its compatibility with his party identification. For example, a pro-Republican candidate preference combined with a pro-Democratic party identification is classified as low candidate compatibility. Low compatibility is the adopted definition of cross-pressures. Similarly, indices of Party Compatibility and Policy Compatibility are constructed for each identifier.[14] The following hypothesis is to be tested.

H 1. Taken singly, each index of compatibility relates monotonically to voting defection—the higher the compatibility, the less the likelihood of defection.

The question remains as to how these indices will interact statistically in their effect upon voting defection.[15] It seems likely that there will be a tendency for attitudes that move the voter in the same direction to reinforce one another.[16] For example, if a voter has unfavorable views toward both his party's candidate and the policies he associates with his party, he may defect in rates above what one would predict from simply summing the independent effects of each of his political attitudes. Thus, the following hypothesis.

H 2. Taken together, certain combinations of the indices are mutually reinforcing. Voters whose indices consistently reveal high compatibility with party identification defect less than an additive model would predict. Conversely, voters with consistently incompati-

[14] A section on specific measurement procedures follows.

[15] Statistical interaction is a change in the relationship between two variables over a range of a third. If the relationship is constant, it is said to be additive. See the Appendix for a lengthy discussion of the meaning of interaction and a method of measuring it.

[16] For an explicit statement of the proposition of interaction among attitudes, see Milton Rokeach and Gilbert Rothman, "The Principle of Belief Congruence and the Congruity Principle as Models of Cognitive Interaction," *Psychological Review,* 72 (Jan., 1965), 128–142.

ble indices defect more than an additive model would predict. Inconsistent indices combine additively.

II. STATUS INCONSISTENCY AND MOBILITY

We have to this point discussed the consequences of political orientations and cross-pressures for voting defection. Working back into the theory, we would like explanations of these intermediate variables. How, in other words, do orientations become incompatible with party identification? For possible answers, we explore status inconsistency and mobility.

Much has been made in recent years of the implications of a multi-dimensional status structure. A man's position in the eyes of others may be determined by several of his characteristics: his ethnic background, income, education, and occupation. Often he moves up and down his individual status ladders at different rates. For some the result is a high position on one status dimension and, concomitantly, a low position on another. This condition is called variously status inconsistency, status discrepancy, and low status crystallization. The effects of status inconsistency may be conceptualized as interaction: certain combinations of status positions affect other variables in ways not predictable by a knowledge of the positions viewed independently.[17]

Lipset and Bendix have theorized on the impact of status inconsistency upon cross-pressures. They state that "The mobile individual, who is in many ways a marginal man, retaining old ties and experiences, is more likely to be subjected to cross-pressure than the nonmobile person."[18] Here, they are speaking of the status discrepant individual. One such tie to the past may be party identification, a loyalty increasingly strained by attitudes formed in new situations.

The relationship of inconsistency to cross-pressures is supported by other literature. Several studies link status inconsistency with political attitudes of the left and the right. Lenski and, to a lesser extent, Kelly and Chambliss present evidence of an association of discrepancy with economic or welfare liberalism.[19] Goffman finds inconsistency associated with a desire for a change in the distribution of power in American society.[20]

Other research binds discrepancy to right-wing extremism. The notion of status politics, the subject of Daniel Bell and others in *The Radical Right,* is grounded to status inconsistency.[21] The research of Rush supports the radical right hypothesis.[22] Kelley and Chambliss reveal associations between inconsistency and unfavorable attitudes toward civil rights and civil liberties.

In short, status inconsistency is associated with extreme attitudes of the right and the left, attitudes which can come into conflict with durable party loyalties. This conflict should be manifest especially in the degree to which a voter's party identification is compatible with his image of the parties and with the policies he associates with them.

H 3. Status inconsistency increases political cross-pressures above the level an additive model would predict.

The same rationale which argues that status inconsistency produces cross-pressures applies to mobility as well. One might reasonably expect inter-generational mobility to be related to cross-pressures. Given the tendency to inherit party affiliation from parents and given the durability of party affiliation, one would predict the grown son of a Democratic skilled worker to be a Democrat also. If, however, the son were a professional man, his association with peer groups likely to hold Republican attitudes could create cross-pressures for the professional man. In statistical terminology, here again is an argument for the existence of interaction. When a

[17] This does not mean that empirically one's method of analysis will always reveal an inconsistency effect as statistical interaction. The Appendix discusses the method of analysis.

person occupies a very different position in the status game than his father did, he may suffer a level of political cross-pressures substantially above what we would predict from a knowledge of the separate effects of the status levels of the father and son.[23] In fact, the sole impact of generational statuses is likely to be interactive, for there is little reason to suspect an additive relationship between the statuses and cross-pressures.

H 4. Inter-generational mobility increases political cross-pressures above the level an additive model would predict.[24]

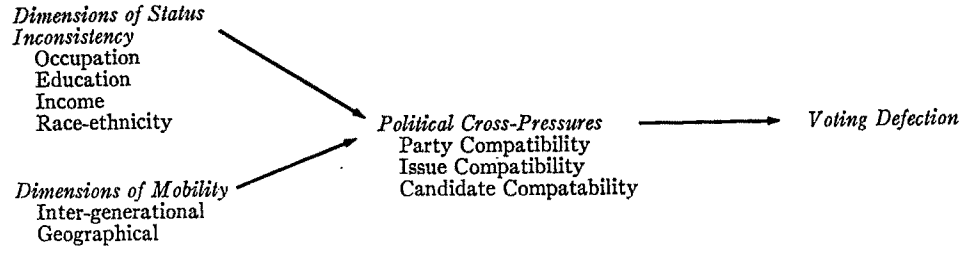
Finally, geographical mobility may tear at the ties of a man to old loyalties. If a man grew up in, say, a predominantly Democratic area and later moved to a predominantly Republican area, his exposure to the political attitudes of new peer groups might place strains upon the party loyalty he had previously acquired.

H 5. Geographical mobility increases political cross-pressures above the level an additive model would predict.

III. MEASURES OF THE VARIABLES AND SOURCE OF THE DATA

Space does not permit an elaborate description and evaluation of the measures of the concepts previously defined. For that the reader is referred to the longer work from which this article is taken.[25] However, a brief explanation of the more complicated measures is in order. We may begin with voting defection.

It seems obvious that the defection of a strong partisan is of greater significance than that of a weak identifier. A measure of defection should reflect differences in the sum of the forces necessary to push a man to vote contrary to his party identification. This sum is gauged in the following manner. Since the 1952 election, the Survey Research Center has asked a standard set of questions designed to measure a man's long term attitudinal attachment to his party. The questions yield an index ranging from Strong Democrat to Strong Republican. To create a measure of defection, the average percentage of defections over the three elections since 1956 may be used as an indicator of the strength of the forces necessary to pull a voter away from his party. The formula $D = 2(P - 50)$ estimates this force, where D is the defection score and P is the average categoric percentage of non-defectors.[26] For example, if a Strong Democrat defects, he is given a score of 80, because the average percentage of Demo-



[23] For example, Blau notes that mobility affects a whole range of behavior, including voting. ". . . the upwardly mobile are more likely to vote Republican than people who have remained workers and less likely to do so than those who have originated in the middle class," Peter M. Blau, "Social Mobility and Interpersonal Relations," *American Sociological Review,* 21 (June, 1956), 291. Presuming that there is not a commensurate change in the disposition among the mobile to switch party identification, then the mobile would be more likely to be numbered among the defectors that the non-mobile.

[24] Analogously, to the degree that a man gains or loses in the status race during his mature years, attitudes formed in one social situation are likely to conflict with attitudes formed in another. Thus, if adequate measures were available in the SRC data, we would also test the hypothesis that intra-generational mobility increases cross-pressures.

[25] Richard W. Boyd, *A Theory of Voting Defection: Attitudinal Cross-Pressures and Political Alienation* (Unpublished Ph.D. Dissertation, Department of Government, Indiana University, 1967), pp. 35–43.

[26] The three elections are chosen because they are recent and because they cover the elections which serve as the tests of the hypotheses. The debt that this measure of voting defection owes to the concept of the normal vote should be obvious. See Converse, "The Concept of a Normal Vote," *op. cit.* In brief, the rationale for the averaging procedure is the assumption that across elections the balance of partisan forces changes, not the pressure required to make a voter defect. What is being assumed, then, is that individuals have threshold points beyond which they cannot resist partisan forces counter to their identification. Furthermore, all men within a given category of identifiers have approximately the same threshold point; i.e., they have a similar degree of allegiance to their party. Different percentages of defectors over different elections are assumed to reflect changes in the strength of the attacks that partisan forces mount against men's threshold points. While men may change their identification, the threshold remains the same—for the category which they leave and for the one into which they move. Within any given category the reason some defect while others do not is simply that some individuals are exposed to more intense partisan forces running counter to their identification than are others. Using the average of the three elections for the measure keeps this threshold point constant and allows the partisan forces of the day to change.
The formula $D = 2(P - 50)$ is itself somewhat arbitrary. The multiplication by 2 allows the theoretical range of the variable to extend from 0 to 1. The multiplication has no effect on the analysis.

FIG. 1. The Presumed Causal Order of the Concepts in the Theory

cratic votes among Strong Democrats is 90 percent. If he does not defect, his score is zero. A Weak Democratic defector receives a lesser score of 44. Republican identifiers are similarly scored. Independents and non-voters are excluded definitionally from the analysis.[27]

The Index of Party Compatibility is adapted from one used by Matthews and Prothro.[28] As many as five responses are coded to each of the questions, "Is there anything in particular that you (don't like) (like) about the (Democratic) (Republican) party?" A maximum of 20 responses, then, is coded for the set. Each favorable remark about the Democratic party or unfavorable remark about the Republican party is scored +1. Each favorable remark about the Republican party or unfavorable remark about the Democratic party is scored −1. To determine the degree of compatibility with party identification, the total score of each Republican is multiplied by −1. Eleven is added to all scores to yield a positive index ranging from 1 to 21. Similarly, Indices of Candidate Compatibility and Policy Compatibility are created from the respondents' views on the candidates and the issues. The issues selected (9 in 1956 and 1960, 10 in 1964) cover the three fields of domestic, foreign, and civil rights policy.[29] The issue index measures only those policy beliefs that are perceived by each respondent to have partisan implications.

There is no need to discuss the measures of status and mobility at length here, for such a description appears in the appendix. Each measurement is straightforward. All four of the dimensions of status that appear in the literature on status inconsistency are included. These are occupational prestige, racial-ethnic prestige, income, and education.

The hypotheses are tested on Survey Research Center data obtained from the Inter-University Consortium for Political Research. This secondary analysis includes the three Presidential elections of 1956, 1960, and 1964. Thus, the hypotheses are exposed to a set of elections which differ in outcome and political environment. If uniformity is found over these three elections, we can have substantial confidence in the generality of these propositions.

IV. THE TESTS OF THE HYPOTHESES

The first hypothesis makes a statement about the effects of cross-pressures upon voting defection. Again, cross-pressures are defined in terms of the degree to which a man's attitudes toward the parties, the candidates, and the policies he associates with the parties are compatible with his party identification. Low scores on any of the three indices of compatibility are said to reflect the voter's state of political cross-pressure.

H 1. Taken singly, each index of compatibility relates monotonically to voting defection—the higher the compatibility, the less the likelihood of defection.

The data amply support the first hypothesis. Table 1 lists the mean voting defection scores for each category of each index of compatibility.

As Table 1 shows, the defection rate drops off sharply as one moves from the categories of low compatibility with party affiliation to those of high compatibility with party affiliation. This is true for every election for each of the party, candidate, and policy indices.

[27] Independent Republicans and Independent Democrats are excluded along with Independents.

[28] Donald R. Matthews and James W. Prothro, "The Concept of Party Image and its Importance for the Southern Electorate," in M. Kent Jennings and L. Harmon Zeigler (eds.), *The Electoral Process* (Englewood Cliffs: Prentice-Hall, Inc., 1966), p. 159.

[29] It does not matter whether or not all these questions elicit responses which fall upon a single liberal-conservative continuum. All that is important is that the questions probe beliefs that are relevant to the voting decision. To the extent that issues ever affect electoral outcome, the questions that make up this index are important questions.

The amount of variance in voting defection accounted for by each of the indices is presented in Table 2. The entry in each cell is the unbiased correlation ratio, an estimate of the percentage of variance in a dependent variable explained by an independent variable.[30]

[30] For a description of the unbiased correlation ratio, see Hubert M. Blalock, Jr., *Social Statistics* (New York: McGraw-Hill Book Co., 1960), p. 267. These ratios are based on a series of one-way analyses of variance. The estimate of the percentage of variance explained is obtained by multiplying the ratio by 100. For example, party compatibility explains 5.8 percent of the variance in voting defection in 1956.

TABLE 1. MEAN DEFECTION SCORE WITHIN CATEGORIES OF COMPATIBILITY FOR 1956, 1960, AND 1964[a]

Index of Compatibility	Category of Compatibility		
	Low	Medium	High
1956			
Party	25.14[b]	10.09	5.18
	(74)[c]	(447)	(435)
Candidate	29.73	7.36	2.12
	(158)	(425)	(373)
Policy	29.61	9.82	3.42
	(93)	(455)	(408)
1960			
Party	31.73	9.41	2.02
	(82)	(495)	(522)
Candidate	28.83	7.17	0.90
	(162)	(448)	(489)
Policy	27.16	7.07	0.97
	(134)	(613)	(352)
1964			
Party	37.60	10.14	2.29
	(86)	(452)	(349)
Candidate	41.35	6.16	1.67
	(145)	(308)	(434)
Policy	25.22	9.21	2.04
	(185)	(351)	(351)

[a] The grand mean defection score for 1956 is 9.02; for 1960, 7.57; for 1964, 9.17.

[b] The entry is the mean defection score for a specific category of compatibility for a specific index for a single year. The higher the score, the greater the defection.

[c] The number within the parentheses is the number of respondents upon which the cell mean is based. In all cases, the category of low compatibility includes all respondents below the theoretical zero point of the index.

TABLE 2. ESTIMATES OF VARIANCE IN DEFECTION EXPLAINED BY INDICES OF COMPATIBILITY

Index of Compatibility	1956	1960	1964
Party	.058	.155	.187
Candidate	.196	.255	.386
Policy	.118	.158	.141

As the cell frequencies in Table 1 reveal, in 1956 and 1960 the largest numbers of voters are cross-pressured in their orientations toward the candidates. Table 2 supports the importance of attitudes toward the candidates. In every election, the Index of Candidate Compatibility explains the most variance in voting defection. The correlation ratio for this index increases each election to a high of .386 in 1964. In 1964, numerous voters had misgivings about the candidacies of both Johnson and Goldwater.[31]

In the two-way analyses of variance (where one variable is controlled for the effects of another), orientations toward the candidates consistently cut into the variance explained by party orientation. An example is Table 3. The marginal means of the two indices are fairly

[31] We might note in this regard the rather low amount of variance in defection explained by policy compatibility in 1964 relative to candidate and party compatibility. Perhaps the direct impact of issues upon voting in 1964 was not as great as is popularly supposed.

TABLE 3. MEAN DEFECTION SCORES WITHIN CATEGORIES OF PARTY AND CANDIDATE COMPATIBILITY IN 1964

Index of Party Compatibility	Index of Candidate Compatibility			
	Low	Medium	High	Marginal Mean
Low	50.36[a]	20.89	6.77	37.60
	(55)[b]	(18)	(13)	(86)
Medium	36.67	7.46	1.46	10.14
	(78)	(196)	(178)	(452)
High	30.50	0.62	1.55	2.29
	(12)	(94)	(243)	(349)
Marginal Mean	41.35	6.16	1.67	9.71
	(145)	(308)	(434)	(887)

[a] Mean Defection Score.

[b] Cell Frequency.

TABLE 4. ESTIMATES OF VARIANCE IN DEFECTION EXPLAINED BY EACH INDEX OF COMPATIBILITY, CONTROLLING FOR ANOTHER INDEX FOR THE PRESIDENTIAL ELECTIONS OF 1956, 1960, AND 1964[a]

Year Control Index	Independent Index		
	Party	Candidate	Policy
1956			
Party		.152	.076
Candidate	.014[b]		.038
Policy	.016	.116	
1960			
Party		.119	.088
Candidate	.050		.064
Policy	.085	.131	
1964			
Party		.224	.060
Candidate	.025		.024
Policy	.106	.268	

[a] The estimate of variance explained by the interaction of the two indices is not included in these totals.

[b] The entry is the unbiased correlation ratio (adjusted for unequal cell sizes). The ratio is taken from Hays, who calls the measure the estimated omega squared. William L. Hays, *Statistics for Psychologists* (New York: Holt, Rinehart and Winston), pp. 406–407. These ratios are adjusted for unequal cell sizes, on the basis of a rationale presented in the Appendix. For the adjustment procedure, see B. J. Winer, *Statistical Principles in Experimental Design* (New York: McGraw-Hill Book Co., 1962), pp. 224–227.

similar. The influence of party compatibility appears to be almost as great as that of candidate compatibility. The cross-classification tells a different story, however. The mean defection scores drop more precipitously within categories of party compatibility (looking across the rows) than within categories of candidate compatibility (looking down the columns). Thus, within levels of candidate compatibility, the impact of party compatibility upon defection is substantially less than when the influence of party compatibility is explored independently of the candidate index. That candidate compatibility soaks up much of the variance explained by party compatibility is evident by a comparison of unbiased correlation ratios for Table 3. Uncontrolled, party compatibility explains 18.7 percent of the variance in defection. Controlled for candidate compatibility, party compatibility explains only 2.5 percent. In comparison, candidate compatibility, uncontrolled, explains 38.6 percent of the variance in defection. Controlled for party compatibility, candidate compatibility still explains 22.4 percent of the variance in defection. Table 4 gives a breakdown of the results of the two-way analyses of variance for all indices and all years.

Thus, attitudes toward the candidates are the major statistical explanation of voting defection. The statistical importance of the candidate orientation may reflect in part an ability among voters to articulate attitudes toward candidates more easily than attitudes toward parties and policies. To state likes or dislikes about parties and policies may require a more sophisticated or abstract set of political concepts than those required to state preferences between candidates. Alternatively, disenchantment with a party or its policies may be displaced upon the candidates as visible symbols of the parties. In any case, our attitudes toward the candidates have a significant impact upon our loyalty to the parties they lead.

Having accepted the first hypothesis, we turn now to a test of the second. It concerns the interrelationships of the indices of compatibility in their effect upon voting defection. Interaction is predicted for individuals who are simultaneously high or low on each of two indices of compatibility. Specifically, the hypothesis reads as follows.

H 2′. Taken together, certain combinations of the indices are mutually reinforcing. Voters whose indices consistently reveal high compatibility with party identification defect less than an additive model would predict. Conversely, voters with consistently incompatible indices defect more than an additive model would predict. Inconsistent indices combine additively.

This is a hypothesis one would like to reject. It is a statement of the existence of interaction, and both theory and statistics deal fitfully with interaction. The world of additive relationships is a simpler world. If additive generalizations do not distort a description of the world too much, additive propositions are preferable to interactive ones.

The amount of variance in voting defection explained by the interaction of the indices of compatibility is small. There are three pairwise comparisons between the three indices in each of the three election years.[32] The range for the

[32] In any year the three pairs are party and candidate, party and policy, and candidate and policy.

nine estimates of variance attributable to interaction is .003 to .022. At maximum, then, only 2.2 percent of the variance in voting defection is explained by interaction among two of the indices. The range of the nine F ratios is 1.834 to 9.773.[33] Six of the nine F ratios are statistically significant above .01.

Despite their statistical significance, the magnitude of the F ratios is not great. Were it not for the consistent pattern of the interaction, the hypothesis of interaction could be rejected in favor of an additive proposition. But there is a pattern to the interaction, a pattern which holds for each pair of indices for each election year. Of the nine tables of pairwise cross-classifications, only one cell of one table departs from the pattern. The pattern (outlined below) involves three cells in each table for a total of 27 separate predictions. The predictions hold in 26 of 27 instances.[34]

The pattern itself differs somewhat from the one predicted in the second hypothesis. (Thus, the 27 predictions above are post-facto observations.) Hypothesis 2 correctly states that individuals who hold two orientations that are both incompatible with their party identification defect more than one would predict from just adding together the separate effects of the two orientations; rather the orientations have a reinforcing impact upon one another, and, thus, combine interactively to produce an additional probability of defection. There are no exceptions to this prediction in any of the three elections. (As the appendix argues, the deviation of the means predicted by an additive model from the observed means is an estimate of the interaction effect for each cell.)

On the other hand, the hypothesis predicts that individuals who hold inconsistent orientations—e.g., a candidate orientation of high compatibility and a policy orientation of low compatibility—conform to an additive model. In fact, voters with inconsistent orientations defect less than the additive model predicts. Table 5 shows

[33] The F ratio for interaction is the interaction mean squares divided by the total mean squares.

[34] When one is testing a proposition about interaction in specific cells, measures of association or F tests should not be a final determinant of acceptance or rejection in any case. These measures of association and F tests are not specific to certain cells. The impact of interaction in one cell is diluted by additivity in another. Thus, the variance explained by interaction may be small in spite of a large impact upon individuals in the interaction cell. This dilution is especially critical when, as is often the case, relatively few people occupy the cell manifesting the interaction effect. For this reason, we assign as much importance to a pattern the interaction displays as to either the variance the interaction explains or its statistical significance.

TABLE 5. THE INTERACTIVE RELATIONSHIP BETWEEN CANDIDATE COMPATIBILITY, POLICY COMPATIBILITY, AND VOTING DEFECTION IN THE 1960 ELECTION

Index of Candidate Compatibility	Index of Policy Compatibility					
	Means Predicted by an Additive Model[a]			Observed Means		
	Low	Medium	High	Low	Medium	High
Low	38.53[b]	24.42	20.77[d]	44.25 (56)[c]	23.65 (85)	8.67[d] (21)
Medium	20.56	6.45	2.79	20.81 (52)	6.95 (283)	1.42 (113)
High	15.89[d]	1.78	−1.88	3.08[d] (26)	1.46 (245)	0.00 (218)
Deviations of Predicted from Observed Means						
Low	5.72	−0.78	−12.10[d]			
Medium	0.25	0.50	−1.38			
High	−12.81[d]	−0.31	1.88			

[a] The prediction equation is

$$\hat{Y}_{ij} = -1.88 + 22.65C_1 + 4.67C_2 + 17.77P_1 + 3.66P_2$$

[b] The entry is the mean defection score, here predicted by an additive model.

[c] The number of respondents upon which the cell mean is based.

[d] Cells of inconsistent orientations.

that if we simply add together the effects of a low Index of Candidate Compatibility and a high Index of Policy Compatibility, we would predict a defection score of 20.77. The observed mean defection score for voters with this combination of orientations is a much lower mean of 8.67. Table 6 presents a slightly abbreviated version of Table 5 for all pairs of indices for every year. In all, there are nine such tables of pairwise comparisons—three tables for each of the three elections. The 18 extremely inconsistent cells from the nine tables are relevant to the test of the combination of inconsistent orientations. In only one of 18 cells is the observed mean defection score not lower than the score predicted by an additive model. What seems to be occurring, then, is a smothering effect of one orientation upon another. A position of high compatibility on one orientation more than offsets a low position on another. When one orientation smothers or countervails another, allegiance to party in voting is greater than one would predict on the basis of the separate effects of the two orientations.

In brief, interaction exists, but it is not the interaction predicted by the second hypothesis. For future tests, we alter the hypothesis to read as follows.

H 2.′ Taken together, certain combintaions of the indices of compatibility combine interactively. Voters whose political orientations reveal low compatibility with party identification defect more than an additive model predicts. Voters who occupy inconsistent positions on two indices defect less than an additive model predicts. All other combinations conform to an additive model.

To this point we have examined cross-pressures as a cause—their additive and interactive impact upon voting defection. We must now ask an additional question, the question of how cross-pressures arise. Earlier, we argued that rates of social mobility provide one explanation of voters acquiring political attitudes which conflict with party allegiance. People at times come to occupy different positions on different status hierarchies. This inconsistency is a source of anxiety and frustration, conditions which can lead to extreme and salient political attitudes. Since attitudes such as these have sources and supports apart from party identification, the hypothesis predicts that these attitudes often conflict with party identification. The effect of status inconsistency, then, is cross-pressure, the incompatibility of political orientations with party allegiance.

H 3. Status inconsistency increases political cross-pressures above the level an additive model would predict.

The data give no support to the hypothesis that status inconsistency increases cross-pressures, no support relative to any of the three indices of compatibility for any pair of the four dimensions of status.[35] Table 7 is a typical example of the lack of a relationship between status inconsistency and cross-pressures.

If the interaction hypothesis were true, in the inconsistent cells the observed mean Index of Candidate Compatibility would be lower than the predicted mean, yielding a negative mean deviation. While one cell mean deviation is negative, the other is positive. The magnitude of the deviations are in both cases small. This is the typical pattern.[36]

Table 7 indicates another finding consistent in the data. There is no additive relationship between the dimensions of status and political cross-pressures. Income, education, occupational prestige, racial-ethnicity, all are unrelated to a disposition to hold political attitudes contrary to party identification.

The importance of status inconsistency in current sociological theory justifies a pause to consider why it proved so impotent an explanation in this particular case. Any of the following four conclusions may be justified. 1) We might simply say that no one has ever demonstrated that status inconsistency is, empirically, a powerful concept. For example, Jackson and Burke explained only about 2 percent of the variance in symptoms of stress with status inconsistency.[37] In short, we could conclude that we have been seduced by the theoretical attraction of a concept which at this point should be discarded. I, personally, am hesitant to do this, simply because the concept still makes substantial intuitive sense to me. Certainly, alternative conclusions are possible. 2) For example, we might conclude that the concept was related to an inappropriate dependent variable. That is, we might say that, while status inconsistency does produce extreme political attitudes, it does not

[35] The four dimensions of status upon which Hypothesis 3 is tested are racial-ethnic prestige, occupational prestige, family income, and education.

[36] Because the tables yield negative results they are omitted. They do appear in Boyd, *op. cit.*, Appendix C.

$$\hat{Y}_{ij} = 13.32 - .64R_1 - .15R_2 + .43I_1 + .21I_2$$

[b] Inconsistent Statuses.

[c] Cell frequencies.

act upon these attitudes in such a way as to create a discrepancy between these attitudes and party identification. The status inconsistent person might be more inclined than others to change his identification to coincide with his attitudes, because political attitudes are more salient for him than the average individual. 3) We might also conclude that some of the measures of status are wrongly applied to national populations. It is one thing, one might say, to rank all of the people in regard to income or education. It is quite another thing to attempt to construct an index of race-ethnicity that is equally applicable to all sections of the country. Being a Jew in New York simply does not affect the life-style of a person like being a Jew in, say, Plainview, Texas. Since some of the more interesting findings in the work of Lenski and of Jackson and Burke do relate to the dimension of race-ethnicity, we might infer that this particular dimension of status should only be applied to populations that live in homogeneous sub-cultures. 4) Finally, we might conclude that status inconsistency is more applicable to some political strata than others. That is, it may be that status inconsistency has its major impact on a small number of real political activists, rather than to a population of rank-and-file voters. Here, we might point to the political careers of highly educated members of various minority groups. In sum, there are a number of refinements we might make in our theories of status inconsistency that argue against its wholesale rejection. The fourth alternative seems especially plausible to me.

In addition to status inconsistency, we have other possible explanations of political cross-pressures. Earlier, I argued the reasonableness of Hypothesis 4.

H 4. Inter-generational mobility increases political cross-pressures above the level an additive model would predict.

A test does not, however, bear out the hypothesis that inter-generational mobility creates cross-pressures. When father's occupational prestige and respondent's social class when growing up are cross-classified, in turn, against the respondent's present occupation and income, in no case does a relationship between inter-generational mobility and political cross-pressures appear.

As a final test, the relationship between geographical mobility and cross-pressures is explored.

H 5. Geographical mobility increases political cross-pressures above the level an additive model would predict.

Two indicators of geographical mobility are available in the SRC election studies. The first is a question asking the length of time the respondent has lived at his present residence. The second indicator is a comparison of the area of the nation in which the respondent grew up with the area in which the respondent lived at the time of the election interview. Neither of these measures of geographical mobility bears any relation to the disposition to hold political attitudes conflicting with party identification. All indices of compatibility in all years conform to the pattern of Table 8.

If Table 8 is collapsed, the mean compatibility score is actually *lower* for those who reside in the area where they grew up than the mean

score for those who have moved away. This result holds for each index in each election, although in no case is the magnitude of the difference great.[38]

V. SUMMARY

1. Cross-pressures relate monotonically to voting defection—the greater the cross-pressures, the greater the likelihood of defection. The degree of cross-pressure is measured by three indices of compatibility, which, in turn, are measures of the extent to which a man's political beliefs support his party identification. A person may hold attitudes about a) the political parties, b) the nominees of those parties, and c) the policies he associates with the parties. If any of these sets of attitudes is in conflict with his party identification, the person is defined as being politically cross-pressured in regard to that attitude. The greater the cross-pressures, the more likely he is to defect, to vote against the candidate of his party.

Cross-pressures are not a wide-spread occurrence. Party identification is a cognitive anchor for our political attitudes. The member of a party is prone to look with approval upon his own party's conduct and to be suspicious of the conduct of the other. He has nice things to say about his party's candidate; he wonders about the other man. He has his notions about public policy, and he sees a difference between the parties in their support of his notions. In short, the influence of party identification upon political attitudes is great. As a rule, the individual holds attitudes that support his identification. To hold such attitudes is usually sufficient to prevent an individual from defecting.

At times, however, forces arise which move some men to acquire attitudes that conflict with their party identification. When they do, these political attitudes tend to prevail over this identification. The greater the conflict between a person's political attitudes and his party identification, the more likely he is to vote for the candidate of the opposing party.

2. The three sets of political attitudes combine interactively in their impact upon the voting act. For example, a man may have unfavorable attitudes toward both the candidate of his party and the policies he associates with his party. Alternatively, he may be favorable in regard to one attitude (such as the candidate of his party), but unfavorable in regard to another (say, his perception of his party's policies). If a voter's political orientations consistently conflict with his party identification, he defects in rates that are higher than one would predict simply from adding together the separate effects of each of the orientations. Orientations that consistently conflict with party identification, then, reinforce one another in their impact on his vote.

Interaction is also manifest when a voter has one favorable and one unfavorable orientation at the same time. In this case the favorable or compatible orientation smothers the impact of the incompatible orientation. The attitudes of such a voter push him in opposite directions, and he defects less than one would predict merely from adding together the separate effects of the two orientations. All other combinations of political orientations conform to an additive model. That is, for all other combinations of pairs of political attitudes, our prediction regarding the likelihood of defection is most accurate when we simply add together the separate impact of each of the two attitudes.

While cross-pressures prove to be an important source of voting defection, the causes of cross-pressures remain unknown. Status inconsistency was wrongly hypothesized as a cause. Alternative explorations of inter-generational status mobility and geographical mobility also failed as explanations of cross-pressures.

In closing, we might speculate upon the relevance of the cross-pressure findings to campaign strategies. The simple and obvious advice is to run attractive candidates. In each of the three elections, attitudes toward the candidates explain the most variance in voting defection. The 1956 and 1964 elections testify to the impact of the candidates. In these two elections a substantial proportion of the electorate seemed at-

[38] The same is also true for the relationship of mobility to voting defection in the three elections. The non-mobile defect more than the mobile in all three elections, though, again the magnitude of the differences is not great.

TABLE 8. MEAN POLICY COMPATIBILITY SCORES FOR COMBINATIONS OF GEOGRAPHICAL MOBILITY IN THE 1964 ELECTION

Area Where Respondent Now Lives	Area Where Respondent Grew Up

tracted to the victorious candidate and repelled by the other. In spite of the fact that he represented a minority, the difference in the appeal of Stevenson and Eisenhower alone was probably sufficient to elect Eisenhower in 1956. In 1964, of course, the Goldwater candidacy produced an overwhelming majority for Johnson.

The importance of issues is more problematic than the importance of candidates. In the 1956 and 1960 elections, attitudes towards the policies that the public associated with the parties ranked second to candidate appeal in impact upon defection.[39] If not as much as candidates, issues do influence the outcome of elections. The impact of issues is problematic because issues seem to have significance beyond any one campaign. That is, it seems a reasonable hypothesis that candidates affect the outcome of specific elections, while issues and their relation to historical events affect the distribution of party identification. The minority does not seek just an occasional victory. Rather, it hopes to realign party allegiance, to become the majority party. To affect a realignment, a President from a minority party may have to identify his administration with attacks on problems the public deems critical.[40] This Eisenhower did not do, and his administration left the distribution of party identification unaltered. In regard to campaign strategy, it would not seem necessary for the candidate of a minority party to emphasize the critical issue or issues in the campaign of his initial victory. But in the course of his administration, he must identify his regime with these critical issues. Undoubtedly, then, future campaigns would be fought on these issues. In short, the impact of a candidate is substantial but of short duration. The impact of issues, while rarely great at any single moment, accumulates over a period of time. Overall, issues may outweigh candidates in affecting the outcome of elections, for issues have the capacity to alter the greatest single determinant of a vote, party identification.

[39] See Table 4. In the 1964 election, however, the rank-order of the importance of the three sets of orientations as judged by their ability to statistically explain voting defection was candidate, party, and policy orientation. The impact of party attitudes is not discussed in relation to its possible impact upon campaign strategy, because there seems little a party could do directly to alter its image with the public. Changes in attitudes toward the parties probably result from candidates and issues.

[40] Quite likely, the type of issue necessary to affect a realignment is a "position issue" rather than a "valence issue." For the distinction between the two, see Donald E. Stokes, "Spatial Models of Party Competition," in Campbell, *Elections and the Political Order,* pp. 171–172.

APPENDIX

THE CONCEPT OF STATISTICAL INTERACTION

In the theory presented in this paper, several of the relationships share a problem of analysis: The independent variables (the presumed causes) are said to combine *interactively* in their impact upon the dependent variable (the presumed effect). Since the exact meaning of statistical interaction is often misunderstood, a brief explanation of the term is perhaps in order.

In normal English usage interaction simply means factors mutually related. This is not its statistical meaning. *Multicollinearity,* the condition of highly related independent variables, is the statistical term that is closest to the English sense of interaction. *Statistical interaction* is a *change* in the relationship between two variables over different levels of a third. The way in which independent variables combine in their effect upon the dependent variable becomes an important datum. If statistical interaction is absent (i.e., if the relationship is *additive*), the relationship between two variables remains *constant* over various categories of the third variable. For example, economic status varies directly with conservatism on welfare issues. But the relationship between welfare conservatism and status may change over different categories of religion. That is, the relationship may be more pronounced with Protestants than, say, Jews. Religion and status, then, combine interactively in their impact upon welfare conservatism.

Multicollinearity and interaction are independent phenomena. As Figure 2 indicates, all combinations of interaction and multicollinearity are possible.[41]

The importance of interaction must not be underestimated. In the first place, there is every reason to think that the world is more complex than additive models suggest.[42] In the second, interaction submits but grudgingly to present

[41] For an illuminating discussion of the subject, complete with graphic examples, see James N. Morgan and John A. Sonquist, "Problems in the Analysis of Survey Data, and a Proposal," *Journal of the American Statistical Association,* 58 (June, 1963), 415–434.

[42] For just a few of the many examples of social phenomena explicitly or implicitly conceptualized in terms of interaction, see the following article and the notes cited therein. Hubert M. Blalock, Jr., "Status Inconsistency, Social Mobility, Status Integration and Structural Effects," *American Sociological Review,* 32 (Oct., 1967), 790–801.

FIG. 2. Statistical Interaction and Multicollinearity

		In their impact upon a dependent variable, the independent variables may combine: Additively	Interactively
The independent variables may be	Related (Multicollinearity)	Possible	Possible
	Unrelated	Possible	Possible

statistical methods. For example, an ordinary multiple or partial correlation coefficient is a weighted average of the relationship between two variables over the range of a third.[43] Such a coefficient assumes this relationship to be constant. If it is not constant, one cannot speak with fidelity to the world of the relationship between, say, A and Y, B controlled.[44] One may physically control for B, but this procedure may suffer a loss of cases. (Of course, it is possible to recover the loss of cases by averaging the measures of association from the individual contingency tables produced by the control from B. However, this procedure presumes that each of the measures is approximately the same, i.e., that there is not interaction.)

One means of handling statistical interaction is analysis of variance. Analysis of variance meets several needs in the tests of the hypotheses in this paper. First, the procedure yields estimates of the total amount of variance in the dependent variable attributable to the additive and interactive effects of the independent variables.

Second, the statistical technique is able to accept unequal cell frequencies. In analysis of variance, specific methods differ, depending on whether cell frequencies are equal, proportionate (which requires the independent variables to be uncorrelated), or disproportionate.[45] If the cell sizes are disproportionate one has to decide whether or not the inequality of cell sizes results from happenstance or from a correspondence of the sample to the population from which the data was drawn. If the latter is true, and it is in my case, then a least squares solution to the problem of unequal cell sizes is probably appropriate.[46]

Third, if one's hypotheses predict that interaction will occur in specific cells, then the technique must be able to locate the cells in which the interaction occurs. Following the lead of Duncan,[47] Jackson and Burke[48] and Treiman[49] have developed one least squares procedure that estimates the specific location of interaction. This procedure utilizes a dummy weighting technique whereby each category of variable A becomes a separate variable A_1, A_2, A_3, etc. For every individual the dummy variables have a value of either 0 or 1 depending on whether or not he falls into that category.[50] Below is an equation of this type specifying an additive model.

$$\hat{Y}_{ij} = a + b_1A_1 + b_2A_2 + b_3B_1 + b_4B_2$$

This is to say that the prediction of a dependent variable score ($\hat{Y}_{ij}$) may be computed from a knowledge of three components: one common to all individuals (a); another common to individuals sharing an attribute (A_i); and a final one common to those sharing a second attribute (B_j). Figure 3 is a graphic form of the equation.

One can see from Figure 3 why it is not necessary to include categories A_2 and B_2 in the equa-

[43] Blalock, *Social Statistics*. p. 332.

[44] As in the case of interaction, problems also crop up when multicollinearity is present. See Hubert M. Blalock, Jr., "Correlated Independent Variables: The Problem of Multicollinearity," *Social Forces*, 42 (Dec., 1963), 233–237.

[45] The remainder of the discussion applies only to multiple-way analysis of variance. One-way analysis of variance, which is used to test some hypotheses, does not require an adjustment of unequal cell sizes.

[46] Winer, *Statistical Principles in Experimental Design*, p. 224. The method has been around a long time. See F. Yates, "The Analysis of Multiple Classifications with Unequal Numbers in the Different Classes," *Journal of the American Statistical Association*, 29 (March, 1934), 51–66.

FIG. 3. A Graphic Representation of an Additive Equation

	B_1	B_2	B_3
A_1	$\hat{Y}_{11}=a+A_1+B_1$	$\hat{Y}_{12}=a+A_1+B_2$	$\hat{Y}_{13}=a+A_1$
A_2	$\hat{Y}_{21}=a+A_2+B_1$	$\hat{Y}_{22}=a+A_2+B_2$	$\hat{Y}_{23}=a+A_2$
A_3	$\hat{Y}_{31}=a+B_1$	$\hat{Y}_{32}=a+B_2$	$\hat{Y}_{33}=a$

tion. The model uses these categories for the constant a. (If we had followed the procedure of Kempthorne and others of setting the constant equal to the grand mean, then a term for A_3 and B_3 would have been included.[51])

Once the regression coefficients in the equation are solved, the differences between the observed cell mean and the mean predicted by the additive equation is an *estimate* of the interaction effect for that cell.[52] If interaction exists, by including an appropriate interaction term in the equation, e.g., $b_8A_1B_3$, differences between the observed and the predicted means are reduced. In this manner one specifies a *form* the interaction may be taking, in this example a multiplicative effect for individuals concomitantly in category A_1 and in category B_3.[53]

To be sure, the knotty problems of statistical inference appear with the use of the least squares method just as with other methods. Several factors other than a status inconsistency effect or a mobility effect can produce statistical interaction. With no claim of being exhaustive, Blalock has noted eight alternative explanations for interaction grouped under the headings of sampling error, measurement error, and specification error.[54] This is just to emphasize that the analyst must always be on guard against the possibility that his results are dependent on (to quote another) "statistico-empiricalistic factors and antifactors." Conversely, it is also true that an interactive world can produce additive statistics under certain limited conditions. For example, if there are, say, mobility effects in opposite corners of a table that affect the dependent variable in

Snedecor, *Statistical Methods Applied to Experiments in Agriculture and Biology* (5th ed.; Ames, Iowa: The Iowa State College Press, 1956), pp. 338–391; and R. L. Anderson and T. A. Bancroft, *Statistical Theory in Research* (New York: McGraw-Hill Book Co., 1952), pp. 278–284.

[52] The assumptions which permit the determination of the coefficients are the following: (1) The sum of squares due to interaction shall be minimized.

$$\sum\sum n_{ij}(\overline{AB}_{ij} - a - A_i - B_j)^2 = \text{minimum}$$

(2) The sum of the interaction terms (the deviations from an additive model), weighted by the cell frequencies, shall sum to zero over each row and each column.

$$\sum n_{j.}A_i = 0 \quad \text{and} \quad \sum n_{.j}B_j = 0$$

In short, the additive pattern in each table is defined as that pattern which minimizes the sum of squares attributable to interaction. The only difference between the procedure used in this paper and the more familiar method of analysis of variance is that, in this procedure, the distribution of cell frequencies is allowed for theoretical reasons to influence the estimates of interaction. The program that computed the coefficients and the adjusted sums of squares was written jointly by C. Richard Hofstetter of Ohio State University and this author.

[53] The use of a least squares technique to estimate the location of interaction is not uncontroversial. In the first place, so long as one's cell means conform to an additive model, the pattern of cell frequencies has no effect on the size of the regression coefficients. However, if one's cell means do *not* conform to an additive model, the pattern of cell frequencies will affect the coefficients and, thus, the magnitude of the deviations from an additive model. Furthermore, because the technique is based on least squares, the largest deviations will tend to be found in the cells with the smallest cell sizes. To guard against the possibility that my results are an artifact of the method I used, I also ran the analysis, substituting equal cell sizes while retaining the original cell means. The same results obtained. In the second hypothesis, the direction of the deviations in the 27 critical cells remained the same in every instance. The size of the deviations did not vary greatly from those in Table 6.

FIG. 4. An Additive and an Interactive Equation Both Producing Additive Cell Means

	B_1	B_2
A_1	00	30
A_2	10	40

1. Additive equation:
   $\hat{Y}_{ij} = 0A_1 + 10A_2 + 0B_1 + 30B_2$
2. Interactive equation:
   $\hat{Y}_{ij} = 0A_1 + 20A_2 + 0B_1 + 20B_2 + 10A_1B_2 - 10A_2B_1$

opposite directions, the data can be quite consistent with an additive model.[55] In Figure 4 it may be seen that both the additive and the interactive equation produce the same pattern of cell means. Fortunately, opposite effects in opposing cells do not seem to be a likely complication in the hypotheses presented in this paper.

Analysis of variance requires that the dependent variable have an interval level of measurement. Except for education and income, this is true of no variable in this study. All other measurements meet ordinal assumptions. In this case it seems preferable to sacrifice strict adherence to assumptions for the power of the variance technique. Given our interest in measuring interaction, the alternative is no analysis.[56]

In addition, the sampling design of all three studies is a clustered design. In tests of significance, this design violates the assumption of a simple random sample. Also, the 1960 election is a weighted sample, with some respondents appearing as many as four times. Taking these individuals out would destroy the sampling design, but leaving them in violates the assumption of uncorrelated error terms in analysis of variance. Because of the clustered design and because of the weighted sample in 1960, we should be cautious in interpreting measures of statistical significance. Thus, all measures of significance reported here are viewed as estimates of the figures that a simple random sample would yield.

Finally, regression analysis can be misleading if substantial multicollinearity exists. To the degree that the independent variables are intercorrelated, sampling and measurement error begin to dominate the estimates of the regression coefficients.[57] As a check upon the amount of multicollinearity among the cross-pressure indices, each of the three indices was run against the other in an ordinary linear regression program. For the three elections, the range of the resulting product moment correlations was .34 to .52. While these figures did not seem excessively high, the precaution was taken to run the three indices against the dependent variable, voting defection, in a multiple regression program (the BMD 03R).[58] This program computed the standard error of the regression coefficients associated with each of the indices. Had multicollinearity been a problem, the standard errors would have been large enough that the coefficients would not obtain statistical significance. However, of the nine coefficients (three coefficients for three years), all were significant at the .01 level. A final bit of evidence against the charge that the results are unduly affected by sampling (as opposed to measurement) error is the fact that the findings are consistent over each of three elections. This consistency would be unlikely if the analysis were really dominated by random error.

THE MEASUREMENT OF THE STATUS VARIABLES

1. Occupational Prestige. The ranking of occupations follows those categories established in the ICPR codebooks.[59] These categories are consistent with those used by others who have ranked occupational groups according to their prestige.[60] These categories are collapsed into three groups:

[55] See the following works by Blalock, "Review Symposium," *American Sociological Review,* 33 (April, 1968), 296–297. "Status Inconsistency and Interaction: Some Alternate Models," *The American Journal of Sociology,* 73 (Nov., 1967), 305–315. "The Identification Problem and Theory Building: The Case of Status Inconsistency," *American Sociological Review,* 31 (Feb., 1966), 52–61.

[56] A few attempts have been made to partition chi-square into additive and interactive effects as in analysis of variance, but the technique seems as yet undeveloped. For example, diochotomization of the dependent variable is required. K. V. Wilson, "A Distribution-Free Test of Analysis of Variance Hypotheses," *Psychological Bulletin,* 53 (1965), 96–101.

[60] For example, see Jackson, *op. cit.,* p. 471. See also Albert J. Reiss, Jr., *Occupations and Social Status* (New York: The Free Press of Glencoe, 1961), pp. 109–161 and Robert W. Hodge, Paul M. Siegel, and Peter H. Rossi, "Occupational Prestige

a. Professionals, etc.; self-employed businessmen
b. Clerical and sales; skilled workers and craftsmen
c. Farmers; semi-skilled workers; service workers; and unskilled laborers.

All respondents are classified according to the occupation of the head of the household. The retired and the unemployed are assigned to their former occupations.

2. Racial-ethnic Prestige. Respondents are ranked according to the categories used by Jackson in his study of status inconsistency and psychological stress.[61] The basis of the ranking is both race and the birthplace of the respondent and his family.

a. Old English or Old American
b. Northern European
c. Southern and Eastern European, Jew, and Non-caucasian.

Race and religion have priority in the rankings. This is, non-caucasians and Jews are automatically assigned to the third category. If the respondent is foreign-born, he is assigned to the category of the country of his birth. If not, if his father is foreign born, the respondent is classified according to the country of the birth of his father. If his father was also native-born, the respondent is classified according to the statement of the country from which his family originally came. If the respondent doesn't know, he is omitted from the analysis. In the 1956 study, the question regarding the origin of the family is absent. Respondents are classified on the basis of the country of his own birth, his father's birth, or his father's father's birth.[62] A large number of respondents are not classifiable under this scheme. The respondent whose family had been in the country long enough to escape classification on the basis of his father's father being native born is classified as Old American.

3. Income. Respondents are ranked according to the income of the whole family.[63] It is this figure than the income of the respondent or the head of the family alone that determines a respondent's life style. The income is trichotomized into approximately equal thirds in the analysis.

4. Education. Education is measured in terms of the number of grades completed, including college.[64] The scale is collapsed into three categories. Following the procedure of Lenski and Jackson, slightly different rankings are established for people above and below the age of 45. The reason, as Jackson states, is that "an older person would not be expected to have as much education as a younger person of the same occupational and ethnic rank."[65] For the older respondents the following categories are set:

a. College education and attended college
b. High school graduate and attended high school—with or without other non-college training
c. Eight years of school or less.

To adjust for age, a respondent under 45 years of age who attended high school only and had no non-college training is assigned to the third category.

CAMPAIGN STRATEGY AND PARTY LOYALTY: THE ELECTORAL RELEVANCE OF CANDIDATE DECISION-MAKING IN THE 1964 CONGRESSIONAL ELECTIONS*

ROBERT A. SCHOENBERGER
University of Michigan

I. INTRODUCTION

The analyst of campaign strategy in American elections is usually confronted by the apparent impossibility of demonstrating that campaign behavior actually matters.[1] Although candidates possess numerous options in strategy and tactics, it is clear that incumbent members of the majority party (commonly joint phenomena) usually win and opposition candidates of the minority party usually lose.[2] Lewis Froman has even argued that ". . . the behavior of the candidates during the campaign is one of the least influential factors in determining electoral outcomes."[3]

*I am grateful to Russell Slade, who collected the data upon which this article is based, and to Warren E. Miller and Donald E. Stokes for their comments on an earlier draft.

[1] Cf. Stimson Bullitt, "Because no one knows what works in a campaign, money is spent beyond the point of diminishing returns. . . No one dares to omit any approach. Every cartridge must be fired because among the multitude of blanks one may be a bullet," in *To Be A Politician* (Garden City, N.Y., 1961), p. 72; Charles F. Cnudde, ". . . political scientists know little about how the campaign affects the vote, or in fact whether it influences it at all," in a book review in this REVIEW, 62 (1968) p. 1365; John W. Kingdon, "Right or wrong, most candidates believe that campaigns affect election outcomes," in *Candidates For Office: Beliefs and Strategies,* (New York, 1968) p. 109. There is, however, some evidence that party *organizations* may, by their efforts, affect the vote. See, e.g., Phillips Cutright and Peter Rossi, "Grass Roots Politicians and the Vote," *American Sociological Review,* 23 (1958), 171–179; Daniel Katz and Samuel J. Eldersveld, "The Impact of Local Party Activity Upon the Electorate," *Public Opinion Quarterly,* 25 (1961), 1–24; William J. Crotty, "The Party Organization and its Activities," in Crotty (ed.), *Approaches To The Study of Party Organizations* (Boston, 1968), pp. 247–306, esp. pp. 277–286.

[2] See Charles O. Jones, "The Role of the Campaign in Congressional Politics," in M. Kent Jennings and L Harmon Ziegler (eds.), *The Electoral Process* (Englewood Cliffs, N.J., 1966), pp. 21–41, esp. pp. 23–24; Milton C. Cummings, *Congressmen and the Electorate* (Washington, 1966), *passim.*

The effects, if any, of campaign behavior are the residue to be examined after the partisan distribution of the electorate, the nature of the times, the power of incumbency and any number of variables beyond the ready control of the candidates themselves have been employed to explain or predict the popular vote distribution. The perceived general ineffectiveness of candidate strategy and tactics is usually explained by the low public saliency of the typical election contest, in which most voters are unlikely to be aware even of the names of the candidates, much less their policy positions or, presumably, any other of their behaviors.[4]

But this circumstance may change when "ordinary" election contests are connected to contests of much higher saliency, especially that for the Presidency. It is at this time, at least, when the strategic decisions and behaviors of certain classes of candidates may attract the attention of voters otherwise preoccupied with that more dramatic battle for power.

For example, a recurring, if seldom widespread, phenomenon of Presidential-year campaigns has been the avoidance or refusal of some candidates to endorse their party's nominee for President. This deviation from the customary forms of campaign behavior—a crime occasionally punished[5]—presumably occurs because the candidate believes his behavior on this question is of importance to some flexible and observant

[5] E.g., in 1965, the House Democratic caucus stripped John Bell Williams and Albert Watson of their committee seniority because they openly supported the candidacy of the Republican Presidential nominee, Barry Goldwater. In 1969, John Rarick received the same punishment (from an unusual second caucus) for endorsing the third party candidacy of George Wallace.

portion of his electorate. Moreover, the infrequency of party punishment of disloyal candidates may be at least partly an unspoken acknowledgment of the necessity or at least comprehensibility of such action. The question then must be asked whether party loyalty may be so systematically costly as to *justify* evasion or violation of that norm.

I assume that a Congressional candidate will risk the consequences of disloyalty (which may include formal punishment, ostracism and alienation or disaffection of existing or potential support groups—in or out of the constituency) only in order to avoid the loss of votes consequent upon his being identified with his party's presidential candidate by his electorate.[6] If such behavior has any systematic effect, it must be that those legislative candidates most closely identified with their party's Presidential candidate will achieve (or suffer) the latter's electoral fate in a direct relationship to that identification.

In the United States, the clarity and ubiquity of behavior necessary to test such a proposition is a rare occurrence. When, as is usually the case, all or nearly all legislative candidates are decently loyal to their ticket, the necessary data are absent, by definition. In 1964, however, the conditions were met to an extent seldom before encountered. The Republican Party nominated Barry Goldwater, a conservative ideologue, for President. He was, moreover, a man with a clear and consistent public record and one whose electoral prospects were poor enough to prompt a wide variety of intra-party campaign behaviors, ranging from absolute endorsement and continuous support—the ideal application of the loyalty norm—to outright rejection and repudiation.[7]

The gross costs of the Goldwater candidacy are well known. He received 38.7% of the national two-party vote and, as part of a general Republican debacle, 39 of the 159 Republican Congressmen running for re-election were defeated. I hypothesize that the relationship between the Presidential vote and the patterns of first differences in the Congressional vote (i.e., between 1964 and 1962), across districts, is dependent upon the supportive association between Republican Congressmen and their party's Presidential candidate. Hence, where such support can be demonstrated, I predict a high positive correlation between the Presidential vote and changes in the Congressional vote. I will use the movement of the vote for Congress between 1962 and 1964 as the best available measure of the short-term forces swaying the electorate in these districts in the latter year. If the Congressman can dissociate himself from the Presidential contest, the correlation should diminish, approaching—in the ideal case of non-support—statistical (and empirical) independence. Thus, the absolutely loyal would be tied directly to the coattails of the head of their ticket while the variation in the results for those candidates intent on strategic maximization would tend to be unrelated to the vote for the Presidential candidate. The null hypothesis would imply that variation in this aspect of campaign behavior had no discernible effect on either voting trends or outcomes.[8]

II. THE EFFECTS OF LOYALTY

The techniques of expression or evasion of party loyalty take many forms. A candidate may identify himself with a slate or head of his ticket willingly and consistently; he may offer honest support but attempt to "run on [his] own record;" offer *pro-forma* support—occasionally or once—and then proceed to differentiate himself as much as possible; simply ignore his running-mates; judiciously praise *competing* candidates; publicly withhold endorsement; or repudiate a partisan colleague's candidacy. (These behaviors are not always mutually exclusive nor is this list necessarily inclusive: it is fixed only by the limits of political inventiveness.) The subtlety and ambiguity of the intermediate behaviors, as well as the unavailability of the type of information which might permit refinement of such categories, necessitate the use of a more limited discrimination among degrees of support. Happily, the results of the analysis lend support to the belief that my classification of candidates by the degree of their support for Goldwater was not in fact compromised by excessive errors.

I have divided incumbent Republican Congressional candidates in 1964 into two groups: signers and non-signers of a public pre-convention endorsement of Senator Goldwater's

[6] His personal motives may in fact vary but are here assumed to be exclusively fear of defeat.

[7] Among those who publicly refused their support—at the very least—were such Congressional party colleagues as Senators Scott, Javits and Keating and Congressmen Lindsay, Tupper, Fulton and Halpern.

[8] These hypotheses also permit, simultaneously, a test of the existence and direction of the coattails effect. In the absence of survey data one can only infer, as I do here, that it is a *Presidential* rather than a *Congressional* Coattail effect that is involved. See Warren E. Miller, "Presidential Coattails: A Study in Political Myth and Methodology," *Public Opinion Quarterly*, 19 (Winter, 1955–56), 353–368.

candidacy.[9] I assume that the signers were that set of Congressmen most willing to be publicly identified with Senator Goldwater and that this behavior was merely an early example of a consistent equivalent set which occurred later in the campaign. It is they, contrasted with the more behaviorally heterogeneous non-signers, whose vote change patterns should vary directly with the Goldwater vote.

This proposition is confirmed. Among the signers the correlation between the presidential vote and changes of the congressional vote is +0.49. In view of the many purely local influences on Congressional races, the correlation is impressive. Moreover, there are technical reasons for believing that it understates the true impact which the presidential contest had on the signers' changing fortunes at the polls.[10]

For the 109 non-signers,[11] the presumed hope for an "independent" electoral judgment was achieved, in the aggregate. The correlation coefficient was −0.01. That is, variation in the Goldwater vote is uncorrelated with and explains *none* of the variance in the vote differences between 1964 and 1962 for the non-signing Republicans.

The possibility remains, however, that these findings reflect other immediate stimuli or structural influences upon voting behavior. For example, there exists some evidence indicating that party column ballots tend to discourage split-ticket voting and that this phenomenon is, by comparison, encouraged by the office-bloc ticket.[12] It is thus possible, in principle, that candidates whose vote change tended to parallel the trend of the Goldwater vote were disproportionately likely to represent districts in party-column states and that independence of that trend occurred generally where the office-bloc ballot was employed.

The addition of controls for ballot form elicits clear results (see Table 1). Where signers ran in Party Column states, the correlation coefficient between the Goldwater vote and Congressional vote-change rises to +0.60. For the matching non-signers, the relationship remains almost perfectly independent ($r = +0.002$). But for signers appearing on office Bloc ballots, the correlation coefficient decreases to +0.22, while for the equivalent set of nonsigners, the relationship is again one of independence ($r = -0.05$).

[9] The endorsement, published in the *New York Times*, June 17, 1964, was signed by 54 Republican Congressmen, 49 of whom were candidates for re-election. It read, in part, "We are convinced that the nomination of . . . Barry Goldwater . . . will result in substantial increases in Republican membership in both Houses of Congress."

[10] Since the redistricting of seats between 1960 and 1962 (and the abnormality of the 1960 presidential election) prevents the use of *changes* of the presidential vote to measure the forces distinctive to 1964, the presidential measure entered in the correlation reflects traditional levels of party strength in the several districts as well as the influence of Goldwater's candidacy and other circumstances specific to 1964. Such an extraneous traditional component tends to reduce any non-vanishing correlation below the level which would be obtained were it possible to correlate changes of the congressional vote with *changes* of the presidential vote.

[11] Representative Sylvio Conte (Mass. 1) is excluded from this analysis, since he gained both Republican *and* Democratic nominations and received 100% of the 2-party vote in his district. Conte was one of those who repudiated Goldwater's nomination, but his inclusion would add spurious strength to the second hypothesis, since his vote could not be other than independent of Goldwater's.

Party Column	.60	(33)	.00	(68)	.17	(101)
Office Bloc	.22	(16)	−.05	(41)	−.03	(57)
Totals	.49	(49)	−.01	(109)		

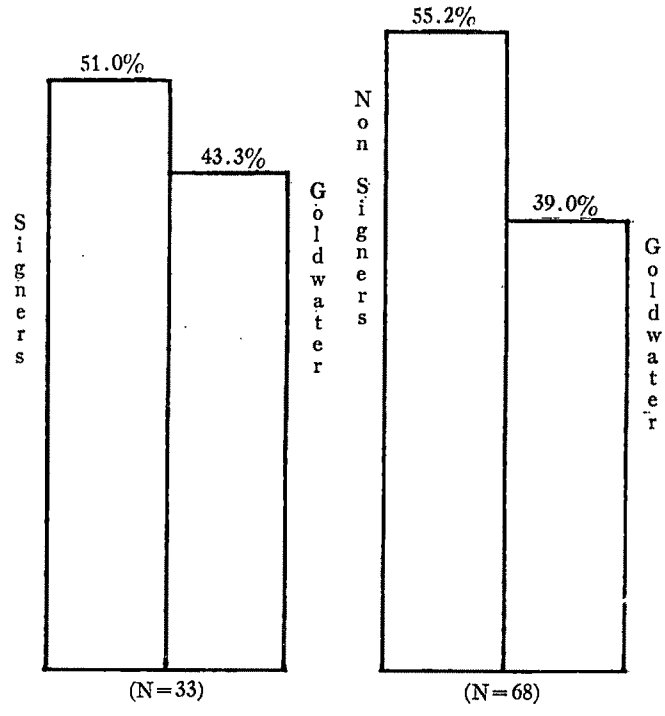

FIG. 1. Mean District Vote Percentage on Party Column Ballots for Republican Congressmen and Barry Goldwater, 1964, by Support for Goldwater.

Thus, the Party Column ballot had the effect of strengthening the relationship between the Goldwater vote and Congressional vote-change, but *only* for the group of early Goldwater supporters. The Office Bloc ballot, by contrast, permitted Congressmen to remain largely independent of the trend of the Goldwater vote.

It is in Party Column states where the divergent campaign strategies of Republican incumbents led to now predictably divergent results. The signers of the Goldwater endorsement were able to maintain, on the average, only a +7.7% margin over the Arizona Senator.[13] Among non-signers, the slippage was +16.2% (see Figure 1).

Faced with an even lower Goldwater vote, typically, than were their signing colleagues, the non-signers not only obtained a higher mean vote percentage, but also tended to suffer smaller losses, compared with 1962,[14] against a stronger tide. Their vote changed, on the average, by −5.3% while the mean change among signers was −6.8%.[15]

The political arithmetic becomes crucial when strategic vulnerability is linked to electoral marginality. Although, as would be expected, the overwhelming majority of defeats were sustained by Republicans occupying marginal seats (those who won with less than 60% of the vote in 1962),[16] the Party Column signers bore a disproportionate share of the burden (see Table 2). Comprising 30% of all marginal Congressmen, they suffered 47% of the losses; making up 35% of such candidates on Party Column ballots, they suffered 56% of the defeats.

There is also, in these figures, a touch of pa-

[13] The "power of incumbency" thesis has never been better demonstrated. Only one Republican Congressmen, Bruce Alger (Texas 5), trailed Goldwater.

[14] Calculations for Congressmen Clausen and Clawson (Calif 1 and 23) are based on the results of Special Elections in 1963.

[15] Whereas strategic difference explains systematic differences on Party Column ballots, the same operation accounts in gross terms for differences on Office Bloc tickets. Here, the mean slippage for signers and non-signers was +9.7% and +17.9%, respectively, and mean vote-change was —4.4% and —2.2%. The original hypothesis thus holds, but only between groups and without explaining internal variation among signers.

[16] Although 55% is commonly employed as the border between marginality and safety, in 1964 relative safety for incumbent Republicans existed on the positive side of 60% rather than 55%.

TABLE 2. MARGINALITY, SAFETY AND THE DISTRIBUTION OF LOSSES IN 1964

Vote in 1962

		<60%			60%+			Totals		
		%	(n)	(Losses)	%	(n)	(Losses)	%	(n)	(Losses)
Signers	PC	72	(24)	(14)	28	(9)	(2)	100	(33)	(16)
Non-Signers	PC	50	(34)	(11)	50	(34)	(5)	100	(68)	(16)
Signers	OB	44	(7)	(1)	56	(9)	(—)	100	(16)	(1)
Non-Signers	OB	39	(16)	(4)	61	(25)	(2)	100	(41)	(6)

thos. Those Congressmen holding marginal seats in Party Column states, and therefore *least* able to pay the penalty which endorsing Goldwater was likely to exact, were *more* likely to be among those endorsers. Forty-one per cent of these marginal Congressmen signed the Goldwater endorsement; only 21% of the safe ones took that risk. The tendency of these signers to hold marginal seats means that their higher *rate* of loss yielded even more actual numbers of signers who were put out of the House.

In short, since the presidential race went strongly against the Republicans in most districts, the displacement of popular hostility to Goldwater onto the Congressmen who supported him most strongly cost the party a good many seats. Among Congressmen who had won with less than 60% of the vote two years before, the proportion defeated in 1964 was well over half again greater among signers than non-signers (48% *versus* 30%). Among such Congressmen whose states employed the Party Column ballot, that proportion of defeats was nearly twice as great (58% *versus* 32%). This contrast is lent added significance by the fact that signers were notably more likely to hold marginal seats; the price was greatest for those who were, on the average, least able to pay it.[17]

[17] It is possible to suggest that the differences found between signers and non-signers arise from the fact that 1964 was a bad year for conservatives, which signers tended to be and Goldwater was. It is necessary to point out that such a hypothesis will not account for the lack of correlation between the Goldwater vote and the changes of support for non-signers, unless they are all uniformly unconservative (while signers are of varying degrees of conservatism, a strange notion). As it happens, the conservatism of signers—or of all Congressmen is unrelated to the change of their support between 1962 and 1964. Employing Congressmens' scores on a measure combining Congressional Quarterly's Conservative Coalition and Federal Role Indexes, the correlation coefficient between relative conservatism in roll-call voting behavior and change of support is —0.08 among signers, —0.11 among non-signers and —0.20 among all Congressmen.

III. DISCUSSION

The belief that campaign behavior is of exceedingly small importance in determining electoral outcomes is grounded primarily in the discovery that factors beyond the control of the candidates, such as incumbency, the partisan distribution of the electorate and general economic and social conditions tend to determine the results. The absence of a literature describing systematic or even widespread, if dissimilar, deviations from this standard expectation has merely served to reinforce its acceptability.

Yet, in at least one election year, 1964, a large number of incumbent Republican Congressmen were confronted by a strategic campaign choice—whether, when and how to endorse the Presidential candidacy of Barry Goldwater. The nature of the decision taken had demonstrable and often crucial effects on the proportion of the vote they themselves received in their districts.

Those Congressmen who offered early and absolute support for the then certain head of their ticket were destined, most clearly when running on Party Column ballots, to be firmly bound to his coattails on election day. Those who refused, qualified or simply withheld until a later date their support for Goldwater's candidacy tended, in the aggregate, to be judged by their constituents on the basis of other considerations or to be rewarded, in varying degree, for their "independent" behavior.

These findings should be most disturbing to some theorists, both positive and normative, of party behavior. For certain varieties of positive theory, they underscore the limits to the empirical usefulness of models that assume that party leaders always act in common. Anthony Downs, for example, assumes that parties are internally unified and forbids *by axiom* any attempt by a

party member ". . . to benefit himself at the expense of any other member of his own party team."[18] An awareness that political leaders (i.e., politicians) act for private motives ought to prompt an extension of models of rational behavior, just as an awareness that public authority is wielded for private motives led Downs, Buchanan, Tullock and other economists to become interested in politics in the first place.

The normative theorists of party government must in turn wrestle with the likely results had all Republican Congressmen put the party's welfare before their own. *That* cohesive and disciplined legislative party, responsible to the party platform[19] and loyal to the Presidential candidate who presumably embodies it, would have been far more vulnerable to defeat than in fact they were. The trends illustrated above and the demonstrated unpopularity of Goldwater in the electorate[20] leave little doubt that the Republican Party in the House would have been little more than a corporal's guard. It is difficult to believe that this is what the party reformers envisioned as the second responsible party.

There is, quite clearly, a sense in which it was both rational *and* responsible for Republican candidates in 1964 to dissociate themselves from the ticket and cut the party's grievous losses in Congress. It was, by some standards, inelegant of them to do so but, for politicians who must live in this world, the assumptions of political modelers need be of no concern—only the reverse is true—and the prescriptions of normative system-builders may be, certainly at the personal level, absolutely dangerous.

THE DESIRED POLITICAL ENTROPY

HENRI THEIL
University of Chicago

I. INTRODUCTION

In an article published in the December 30, 1967 issue of the Dutch weekly magazine *Vrij Nederland*, Mr. Frans Grosfeld suggested the following modification of the procedure of parliamentary representation of political parties. Instead of the conventional method of allocating to each party a number of representatives proportional to the number of votes cast for the party, he proposed to allocate a number of representatives which is proportional to the square of the number of votes. Thus, when there are n parties and when $p_1, \cdots, p_n$ are the proportions of the total number of votes obtained by these parties, the idea is to allocate a fraction q_i of the representatives to the ith party determined by

$$(1.1) \qquad q_i = p_i^2 / \sum_{j=1}^{n} p_j^2 \qquad i = 1, \cdots, n$$

Mr. Grosfeld made this suggestion for the Dutch political system, because in his view n is so large and even the largest p_i belongs to a minority party, so that on many occasions several months of negotiations were necessary to obtain a coalition cabinet of one form or another. By squaring the p_i's one obtains much larger relative differences between the larger and the smaller parties, and one party or a pair of politically related parties then has a much better chance of obtaining a parliamentary majority. Also, the system (1.1) provides an incentive for parties to merge, which contributes to a reduction of the degree to which the country is politically divided. This system should be contrasted with another system which is applied on a rather large scale, viz., that of declining any seat to those parties whose p_i is less than a pre-assigned fraction θ (for example, $\theta = .03$). The fractions in the parliament are then:

$$(1.2) \qquad \begin{array}{ll} q_i = 0 & \text{if } p_i < \theta \\ p_i/(1 - A) & \text{if } p_i \geq \theta \end{array}$$

where $A = \sum p_j$, the summation being extended over those values of the subscript j for which $p_j < \theta$.[1] The cut-off system (1.2) also discriminates against small parties, but the system (1.1) proceeds in a more continuous manner.

It is interesting in this connection that the International Federation of Operational Research Societies (IFORS) faces a similar problem but in precisely the opposite direction. The problem is that the national member societies are of very unequal size, so that IFORS could be dominated more or less permanently by the societies of one or two countries if proportional representation based on national membership were applied. To prevent this, a rule has been adopted which gives each member society a number of votes proportional to the square root of the number of members:

$$(1.3) \qquad q_i = p_i^{1/2} / \sum_{j=1}^{n} p_j^{1/2} \qquad i = 1, \cdots, n$$

where n is the number of member societies, p_i the ith society's share of total membership, and q_i its share in the IFORS voting procedure. Thus, if the ith society has four times as many members as the jth, the number of its votes is only twice as large.

The system of ratios squared (1.1) and the square-root system (1.3) are both special cases of

$$(1.4) \qquad q_i = p_i^{\alpha} / \sum_{j=1}^{n} p_j^{\alpha} \qquad i = 1, \cdots, n$$

A specification $\alpha > 1$ serves to raise the size of the larger groups and to reduce that of the smaller groups, whereas $\alpha < 1$ has the opposite effect. The latter variant is sometimes used to protect geographical minorities. The IFORS case is one example; the U.S. Senate is another, since it gives equal representation to all 50 states independent of their population. Thus, if p_i stands for the number of voters of the ith state measured as a fraction of the national total and q_i for the proportion of Senators allocated to this state (1/50), (1.4) applies to this case when we specify $\alpha = 0$.

[1] Since the number of representatives allocated to each party must be a nonnegative integer, the actual q_i's will be slightly different from those defined in (1.1) and (1.2). This feature will be disregarded in the present note, but it should be stressed that the criterion used in Section 2—the minimization of the information expectation defined in eq. (2.4)—can be used to handle this problem. The approach is then to minimize the information expectation subject to the constraint that each q_i be a nonnegative multiple of $1/N$, where N is the total number of parliamentary seats.

There are thus several examples of the representation system (1.4): $\alpha=0$ (U.S. Senate), $\alpha=\frac{1}{2}$ (IFORS), $\alpha=1$ (proportional representation), and $\alpha=2$ (Mr. Grosfeld's proposal).[2] This makes the system (1.4) interesting by itself, but it is clear that this particular one-parameter family is only one choice out of many. In this note I shall show that the family of representation systems (1.4) has certain optimal properties. In Section 2 I shall derive this family by means of a constrained optimization technique based on some elementary concepts from information theory. In Section 3 I will derive the same family from some simple axioms, after which some concluding remarks follow in Section 4.

II. AN INFORMATIONAL APPROACH

There can be no doubt that the representation system $q_i=p_i$ is the simplest and most straightforward, and the reason for choosing a different system is basically the same in all cases discussed above: One is dissatisfied with the degree to which the total representation is divided into parts, and the "dividedness" is either regarded as too large, in which case one would like to reduce it (by choosing $\alpha>1$ in the system (1.4)), or it is regarded as too small. Therefore, what is needed in the first place is a measure which describes the degree to which the total is subdivided. A natural and well-known measure, based on concepts from information theory, is the *entropy*.[3] For the fractions $p_1, \ldots, p_n$ the entropy is defined as

$$H_p = -\sum_{i=1}^{n} p_i \log p_i \tag{2.1}$$

which is nonnegative and which vanishes if and only if $p_i=1$ for some i (and hence $p_j=0$ for $j\neq i$). The maximum is $\log n$, which is attained when the p_i's are all equal to $1/n$. Thus, the entropy takes the smallest value when the scene is dominated completely by one group (which amounts to a minimum of "dividedness") and the largest value when all groups are of equal size; and this maximum, $\log n$, increases in turn when the number of groups (n) increases. We shall exclude the possibility that H_p is equal to either limit:

$$0 < H_p < \log n \tag{2.2}$$

If $H_p=0$, then some p_i is equal to one and all others are zero. Clearly, there exists no non-arbitrary way of assigning parliament seats to parties which did not receive any vote at all. If $H_p=\log n$, all n parties received the same number of votes, and there exists no reasonable way of allocating parliament seats to these parties on another than equal basis.

But if H_p satisfies the constraint (2.2), as is normally the case, one can conceive of a set of parliamentary fractions $q_1, \ldots, q_n$ whose entropy

$$H_q = -\sum_{i=1}^{n} q_i \log q_i \tag{2.3}$$

differs from H_p. Obviously, if we fix H_q at a pre-assigned level, we still have freedom as to the choice of $q_1, \ldots, q_n$ when $n\geq 2$,[4] and we would like to choose the q's as closely to the corresponding p's as is possible. Given that the informational concepts H_p and H_q are used to measure "dividedness," a natural way of specifying "as close as possible" is the following. Consider $p_1, \ldots, p_n$ as the prior probabilities of n events and imagine that a message arrives which indicates that the odds in favor of these events have changed to the extent that the new (posterior) probabilities are $q_1, \ldots, q_n$. The expected information of this message is defined in information theory as

$$I(q:p) = \sum_{i=1}^{n} q_i \log \frac{q_i}{p_i} \tag{2.4}$$

where q and p on the left stand for $q_1, \ldots, q_n$ and $p_1, \ldots, p_n$, respectively. The information expectation is never negative. It vanishes if and only if $p_i=q_i$ for each i, and it takes larger and larger values when the p's and q's are pairwise more different.[5]

[2] Plus the case $\alpha=\infty$ (i.e., allocating all seats to the ruling party), a procedure used in some of the democratically less advanced countries.

[3] For a brief introduction to the informational concepts used in this section, see e.g. Chapters 1 and 2 of the author's *Economics and Information Theory* (Chicago: Rand McNally and Company, and Amsterdam: North-Holland Publishing Company, 1967). The idea of using the entropy for this particular purpose is due to Mr. B. M. S. van Praag of the Econometric Institute in Rotterdam.

[4] Even for $n=2$ the entropy does not determine the q's uniquely, because $(\theta, 1-\theta)$ and $(1-\theta, \theta)$ have the same entropy for any θ in the interval (0, 1). It is obvious, however, that the present discussion loses much of its interest when $n=2$ instead of $n>2$.

[5] This becomes particularly clear when $I(q:p)$ is expanded according to powers of $(q_i-p_i)/p_i$. If we use natural logarithms (which is done throughout this paper) and disregard third and higher powers, the result is

$$I(q:p) \approx \frac{1}{2}\sum_{i=1}^{n} \frac{(q_i-p_i)^2}{p_i}$$

provided that the p's and q's are pairwise suffici-

The information expectation (2.4) is a measure of the degree to which we are surprised when we are informed that the prior probabilities $p_1, \ldots, p_n$ are replaced by the posterior probabilities $q_1, \ldots, q_n$. Interpret now the p_i's again as the proportions of the votes cast for the various parties and the q_i's as the corresponding proportions of parliamentary seats.[6] Obviously, the electorate ought to be surprised as little as possible. Consider then:

THEOREM 1. *Let $p_1, \ldots, p_n$ be the proportions of the total number of votes cast for the n parties and suppose that* (2.2) *is satisfied. Then the parliamentary representation $q_1, \ldots, q_n$ which minimizes the information expectation* (2.4) *subject to the entropy constraint* (2.3) *is given by eq.* (1.4), *where α is the solution of eq.* (2.11) *below. This solution exists and is unique for any preassigned value of the entropy H_q in the interval* (0, log n) *if exactly one party has the largest number of votes.*

The remainder of this section is concerned with the proof of this theorem. We note first that under condition (2.3) the information expectation (2.4) can be written as

$$I(q:p) = -H_q - \sum_{i=1}^{n} q_i \log p_i \tag{2.5}$$

so that we should minimize $-\sum q_i \log p_i$ subject to the constraints (2.3) and $\sum q_i = 1$. So we form the Lagrangian expression:

$$-\sum_{i=1}^{n} q_i \log p_i - \lambda\Big(-\sum_{i=1}^{n} q_i \log q_i - H_q\Big) - \mu\Big(\sum_{i=1}^{n} q_i - 1\Big) \tag{2.6}$$

where λ and μ are Lagrangian multipliers. We differentiate with respect to q_i and equate the result to zero:

$$-\log p_i + \lambda(1 + \log q_i) - \mu = 0 \qquad i = 1, \cdots, n \tag{2.7}$$

If $\lambda = 0$, this amounts to $\log p_i = -\mu$, which implies that all p_i's must be equal to $1/n$ and hence $H_p = \log n$. This, however, is excluded by (2.2). So $\lambda \neq 0$ and hence:

$$\log q_i = -1 + \frac{\mu}{\lambda} + \frac{1}{\lambda} \log p_i \qquad i = 1, \cdots, n \tag{2.8}$$

or equivalently:

$$q_i = \frac{p_i^{1/\lambda}}{C} \quad \text{where } C = e^{1-\mu/\lambda} \tag{2.9}$$

We now write $\alpha = 1/\lambda$, so that $q_i = p_i^\alpha / C$ in accordance with (1.4), and C obviously satisfies

$$C = \sum_{i=1}^{n} p_i^\alpha \tag{2.10}$$

in view of the sum constraint $\sum q_i = 1$.

Next substitute p_i^α / C for q_i in the entropy constraint (2.3):

$$H_q = -\sum_{i=1}^{n} (p_i^\alpha / C) \log (p_i^\alpha / C) = \frac{-\sum_{i=1}^{n} p_i^\alpha \log p_i^\alpha + \Big(\sum_{i=1}^{n} p_i^\alpha\Big) \log \sum_{i=1}^{n} p_i^\alpha}{\sum_{i=1}^{n} p_i^\alpha}$$

or

$$H_q = \log \sum_{i=1}^{n} p_i^\alpha - \frac{\alpha \sum_{i=1}^{n} p_i^\alpha \log p_i}{\sum_{i=1}^{n} p_i^\alpha} \tag{2.11}$$

For given H_q, $p_1, \ldots, p_n$ this is a nonlinear equation in α. The righthand side is equal to $\log n$ for $\alpha = 0$ and to zero in the limit for α increasing indefinitely, provided that one party has the largest p_i.[7] To prove that (2.11) gives a unique solution for any H_q between these limits it is sufficient to show that the righthand side is a monotonically decreasing function of α. So we consider its derivative with respect to α, which turns out to be:

$$-\frac{\alpha \sum_{i=1}^{n} p_i^\alpha (\log p_i)^2}{\sum_{i=1}^{n} p_i^\alpha} + \frac{\alpha\Big(\sum_{i=1}^{n} p_i^\alpha \log p_i\Big)^2}{\Big(\sum_{i=1}^{n} p_i^\alpha\Big)^2} = -\alpha \sum_{i=1}^{n} q_i \Big(\log p_i - \sum_{j=1}^{n} q_j \log p_j\Big)^2 \tag{2.12}$$

The expression on the second line is a multiple $-\alpha$ of the weighted variance of $\log p_1, \ldots, \log$

---

ently close to each other (so that the expansions converge). The right-hand side of this approximation is proportional to a chi-square with the p's as theoretical probabilities and the q's as observed frequencies.

[6] To make the discussion more concrete, we will talk about parties and parliamentary seats rather than about both these and the geographic representations such as those of IFORS and the U.S. Senate.

[7] Write p_1 for the largest p_i, then q_1 converges to 1 as $\alpha \to \infty$, so that $H_q = 0$ in the limit. If $p_1 = p_2$ and if all other p_i's are smaller, then $q_1 = q_2 = \frac{1}{2}$ in the limit and hence $H_q > 0$ even when $\alpha = \infty$. In the case of a k-fold multiple maximum, $p_1 = \ldots = p_k > p_{k+1} \geq \ldots \geq p_n$, the interval for H_q mentioned in Theorem 1 should be confined to (log k, log n).

p_n with $q_1, \ldots, q_n$ as weights.[8] The derivative is therefore negative for all positive α except when the variance vanishes, and this variance vanishes only if $p_i = 1$ and hence $q_i = 1$ for some i ($H_p = 0$) or if $p_i = 1/n$ for each i ($H_p = \log n$).

III. AN AXIOMATIC APPROACH

In the system of proportional representation the number of parliamentary seats allocated to each party, measured as a fraction of the total number of seats, is determined uniquely by the number of party votes relative to the total number of votes. In fact, the rule is simply $q_i = p_i$, $i = 1, \ldots, n$. Other systems such as (1.4) do not have this property, but a weaker variant, which may be called the condition of *weak proportionality*, certainly seems reasonable. Consider any two parties i and j; then the number of parliamentary seats allocated to i relative to the number of seats allocated to j should be determined uniquely by the ratio of the number of votes cast for i to that cast for j, and the underlying relationship should be the same for all pairs (i, j) and it should be nondecreasing. This means:

$$(3.1) \qquad \frac{q_i}{q_j} = f\left(\frac{p_i}{p_j}\right) \quad i, j = 1, \cdots, n$$

where $f(\ )$ is a nondecreasing function which takes positive values for all positive values of the argument.

Consider then any triple of parties, (i, j, k). We obviously have

$$(3.2) \qquad \frac{p_i}{p_k} = \frac{p_i}{p_j}\frac{p_j}{p_k} \qquad \frac{q_i}{q_k} = \frac{q_i}{q_j}\frac{q_j}{q_k}$$

which means $f(p_i/p_k) = f(p_i/p_j)f(p_j/p_k)$. Since this equation holds for any positive values of the arguments, we may write it as

$$(3.3) \qquad f(x)f(y) \equiv f(xy) \quad x, y > 0$$

Write $\xi = \log x$ and $\eta = \log y$, so that

$$(3.4) \qquad \log f(x) \equiv \log f(e^{\xi}) \equiv \phi(\xi) \quad \text{say}$$

Taking logarithms on both sides of (3.3) we obtain

$$(3.5) \qquad \phi(\xi) + \phi(\eta) \equiv \phi(\xi + \eta) \quad -\infty < \xi, \ \eta < \infty$$

from which it follows immediately that, if $f(\ )$ and hence $\phi(\ )$ are continuous functions, $\phi(\xi)$ must be of the form $\alpha\xi$ for some constant α.[9] Hence:

$$(3.6) \qquad f(x) \equiv e^{\phi(\xi)} \equiv (e^{\xi})^{\alpha} \equiv x^{\alpha}$$

so that we obtain:

$$(3.7) \qquad \frac{q_i}{q_j} = \left(\frac{p_i}{p_j}\right)^{\alpha} \quad i, j = 1, \cdots, n$$

This condition determines the ratios of all q's. Since they add up to one, they are thus individually determined and it is immediately obvious that they are of the form (1.4). The condition that $f(\ )$ be nondecreasing implies $\alpha \geq 0$. We have thus proved:

THEOREM 2. *Let $p_1, \ldots, p_n$ be the proportions of the total number of votes cast for the n parties and $q_1, \ldots, q_n$ the corresponding parliamentary representation. If weak proportionality is imposed in the sense of* (3.1), *where $f(\ )$ is a continuous nondecreasing function satisfying $f(x) > 0$ for any $x > 0$, then the q's are determined by the p's as described in eq.* (1.4) *for some $\alpha \geq 0$.*

IV. CONCLUDING REMARKS

The results obtained in the two previous sections indicate that, if one is dissatisfied with proportional representation, there are rather cogent reasons for choosing a member of the family (1.4). The next problem is then the specification of the parameter α. In Mr. Grosfeld's proposal the value 2 is chosen a priori, but it may be argued that the voters should have a say in the matter. In fact, a plea can be made for the idea that the citizens of a country should have the right to vote on the degree to which they will be politically divided in their own Parliament. This would give the voting procedure a two-dimensional character: Each citizen votes for the party of his preference, thus raising the corresponding p_i at the expense of all other p's, and he also votes for a particular numerical value of the parliamentary entropy,[10] thus indicating how in his view

[8] By substituting $\log q_i$ for $\alpha \log p_i - \log C$ in the second line of (2.12) we obtain a result that can be written as follows:

$$\frac{\partial H_q}{\partial(\log \alpha)} = -\sum_{i=1}^{n} q_i(-\log q_i - H_q)^2 \quad \alpha > 0$$

which means that a small relative increase in α reduces the entropy H_q by k times this increase, where k is the variance of the distribution whose values are $-\log q_1, \ldots, -\log q_n$ and whose probabilities are $q_1, \ldots, q_n$. Obviously, the mean of this distribution is the entropy H_q.

[9] For details, see e.g. *Economics and Information Theory* (quoted in footnote 3), p. 7, or B. O. Koopman and G. E. Kimball, "Information Theory," Chapter 9 of *Notes on Operations Research 1959*, assembled by the Operations Research Center, Massachusetts Institute of Technology (Cambridge, Mass.: The Technology Press, M.I.T., 1959).

[10] This will of course require the teaching of logarithms at an early stage. Mathematics teachers should regard it as a challenge to teach a subject with immediate political science applications.

$p_1, \ldots, p_n$ should be transformed to the parliamentary fractions $q_1, \ldots, q_n$. In theory, there will be as many different desired entropy values as there are voters; an obvious choice is to substitute the median for H_q in the entropy constraint (2.3). One may also argue that the voters collectively decide on the fractions $p_1, \ldots, p_n$ and that, therefore, H_p is the implied desired entropy, which is normally different from the median of the "directly" desired entropies. This conflict can be resolved by substituting for H_q in (2.3) the average of H_p and the median desired entropy. Clearly, there are many possibilities.

It is also important to reflect on the degree of association between the two components of each citizen's vote. A priori, one may be inclined to speculate that, if a person votes for a large party, there is a large chance that he will vote for a small entropy. Specifically, let us arrange the parties according to decreasing size:

$$p_1 \geq p_2 \geq \cdots \geq p_n \tag{4.1}$$

and let us write π_i for the probability that the person votes for an entropy $<H_p$, given that his vote goes to the ith party. The above speculation in more specific form is then:

$$\pi_1 \geq \pi_2 \geq \cdots \geq \pi_n \tag{4.2}$$

The proportion of votes for an entropy $<H_p$ is then $\pi_1 p_1 + \ldots + \pi_n p_n$, which may be quite high because the p's and π's are positively correlated according to (4.1) and (4.2). Thus, the presumption indicates that there will normally be a tendency for the median desired entropy to be on the low side, which favors the largest party.

The underlying assumptions are questionable, however. First, there are many situations in which it is far from certain which party will be the largest. If i and j are the leading contenders, and if a voter favoring i tries to help this party by voting for a small entropy, his efforts will be in favor of j rather than i if p_j turns out to be larger than p_i. Second, even if a voter prefers a party which in his view will definitely be the largest, he may nevertheless be in favor of a fairly large parliamentary entropy when he is violently against the second-largest party and when he wants a coalition cabinet of his preferred party with one or two smaller parties. Voting for the parliamentary entropy requires that the citizen consider the political structure as a whole. This is an appeal to his intelligence, which has its merits in and by itself.

COMMUNICATIONS

To the Editor:

I had looked forward to reading Ernest A. Duff's and John F. McCamant's "Measuring Social and Political Requirements for System Stability in Latin America," in the December Review, since this is an area in which we are now in a position to make real progress, and since McCamant had previously written with some insight on political development theory as applied to Latin America. The article itself was a great disappointment, however, and I feel I should point out some of its limitations, because readers unfamiliar with Latin America, and impressed by the authors' tables and their "prediction" that revolution was imminent in Cuba in 1968, might otherwise be inclined to take the article's conclusions seriously.

As it happens, this is rather difficult to do, since major predictions made in it were being falsified even while the article was in press. A military *coup* imposed a dictatorship on Panama, rated by Duff and McCamant the second highest country in Latin America in system stability, and predicted to enjoy "continued democratic stability with minor difficulties;" Brazil, in which "a semi-democratic system should be able to survive the minor manifestations of discontent," experienced a shift within the ruling group which put an end to the "semi-democratic" facade and imposed a thoroughly repressive system.

If the other predictions made hold, it will be fortuitous. Some are clearly doomed on their face, such as that for the Dominican Republic: "The surface manifestations of discontent of 1965 will diminish. The military will continue to play a large political role but without need for extensive repression of political freedoms." And, notwithstanding last fall's demonstrations and their repression, Mexico remains a marvel of stability, even though Duff and McCamant only rated it 15th out of 20 countries.

This is not merely bad luck. The predictions are poor because there are several key weaknesses and discontinuities in the argument from which they are derived; weaknesses which, in fact, make it difficult to understand why the editor and the readers of the manuscript accepted it as it stands. These weaknesses go beyond mere factual inaccuracy, such as the nonsensical description of Ecuador as without institutionalized parties.

This is all highly unfortunate, because the basic theoretical premise of the article seems sound, that instability derives from an excess of demands, growing out of social mobilization, over satisfactions. But this sound beginning is vitiated by clumsiness in the construction and use of the two key indices. Despite the air of statistical exactness, this is still thumb-on-the-scale measurement. ("The authors decided that the political capabilities should be given equal weight to the environmental scores. The societal welfare minus social mobilization score was given twice the weight of the score on recent economic growth." p. 1130). In this kind of work, one is well advised either to maintain the chastity of one's numbers intact or alternatively to forgo using numbers altogether, and rely on judgment born of experience. *Demi-vierge* status is not viable.

More important, the measures used to construct the social welfare and social mobilization indices happen to measure fundamentally the same dimension—wealth—rather than two separate ones. Exasperatingly enough, the authors almost know this (". . . the correlation coefficient between the two indexes is .92." p. 1132). One can see this even *a priori:* the literacy rate measures social welfare, but newspaper circulation measures social mobilization. But we do have factor analysis to tell us to what extent measurements indicate separate dimensions, after all; thus the indicators best adapted to measuring a given dimension could have been discovered empirically. The authors' procedure is especially to be regretted, again, since they knew the danger they were running: "We restricted the two indexes as far as possible to criteria that were distinct." (p. 1132). They could have done this more effectively by consulting an indicator which they didn't use, the voting turnout figure, which happens to be the indicator of social mobilization least determined by the society's income level.

The upshot of all this is that the figures Duff and McCamant arrive at for the differential between welfare and mobilization are quite without significance. Despite their brave subsequent attempts at interpretation, which involve the injection of a little more subjectivity into the individual country profiles at the end of the article in the attempt to get them "right," these are therefore quite unreliable. Again, this is highly unfortunate, but also rather unnecessary, since an understanding of the stability picture in any one country, and estimates of future stability, are probably most reliably produced, without particular difficulty, by old Latin America hands who know the country in depth.

What we are really in need of, however, is not dubious predictions that are instantly falsified, but clarification of the relationships among social, economic, and political variables that lead to stability or instability. What should have been the starting point of the article became its conclusion. What should have been the conclusion was assumed away. Perhaps the APSR's manuscript readers will point some of these things out the next time an article like this is submitted, and we will all be better off.

MARTIN C. NEEDLER
University of New Mexico

TO THE EDITOR:

Professor Needler's use of language distracts from a useful scholarly dialogue, but a few comments on his critique might help to bring the discussion back into perspective. He claims (1) that our predictions have been proved wrong, (2) that our social welfare-social mobilization differential is useless because both measure wealth, and (3) that "old Latin American hands" can better estimate future stability.

Our predictions have not been proved wrong by recent events. The coup in Panama did not manifest any basic system instability as shown by the relative absence of violence, repression or social controversy. Our information on Brazil is not complete, but the present regime is certainly not a "thoroughly repressive system" by Latin American standards, and it now manifests its moderate instability through coercion instead of inflationary monetary and fiscal policy. In the Dominican Republic, the surface manifestations of discontent have very significantly diminished, as we predicted. If we had been able to quantify the political party situation and included it in the final measurement, Mexico would be ranked somewhat above 15th, but at any rate the demonstrations of last summer as well as periodic outbreaks of rural violence do not indicate that it is a "marvel of stability."

Yes of course, social welfare and social mobilization are both related to wealth and are highly correlated, but what is more significant is that in a few countries welfare is relatively higher than mobilization and in a few others mobilization is relatively higher than welfare. In these six or eight countries the differential is important. A non-synchronic comparison would reveal far greater variation. All Latin American countries along with other countries which have begun their economic progress in this century are in a much more difficult situation than were those countries which began development in an earlier period. We hold that the social welfare-social mobilization differential is a large advance in precision over the widely accepted notion of the demonstration effect.

Are "old hands'" impressions still better than a more systematic approach? We have had considerable experience in a few countries, but we do not consider our own impressions of these countries adequate in making any firm conclusion about their stability. In any case the comparative study that specifies and operationalizes its variables has the advantage of furnishing a base from which better theory can be built. But whose predictions have been better than ours? No "old hand" predicted the Cuban revolution, and we have seen no better *ex post* explanation of it than ours. The ranking we achieved of Latin American political systems does to a great extent correspond to the manifestations of their system stability/instability. Previous studies, instead of showing the important differences between Latin American countries, tried to lump them all together as unstable when clearly not all of these countries are equally confronted with "chaos," "revolution," "the eleventh hour" and the like. The weighting of factors is a problem, as Professor Needler rightly points out, but we can only repeat what we said in the article: more sophisticated mathematical manipulation can be carried out only when we have an independent measure of the manifestations of system stability/instability. We are working on that measure now and plan to publish a more complete work which will overcome many of the weaknesses of the article (most of which Professor Needler missed).

ERNEST A. DUFF
JOHN F. MCCAMANT
Randolph-Macon Woman's College
University of Denver

TO THE EDITOR:

In his recent lengthy article in the REVIEW (June '68) entitled "The House and the Federal Role . . ." Michael J. Shapiro developed an elaborate model to simulate voting in the Congress of the United States. We have no reason to question his model, nor even to question most of the methods and tests used to validate the effects of the model, but we do question his use of certain words and phrases that strongly imply a level of statistical proof which his own data do not support.

Perhaps our point can best be made by several quotations from the Shapiro article: "The *fact* that every alternative formulation of the model undertaken thus far has decreased some aspect of the model's performance lends evidence in support of the contention that the relatively good match obtained between the actual roll-call voting in the House . . . and in our sim-

ulation . . ." (p. 517, our emphasis). "The micro level performance or average percentage of representation correctly simulated by the 'just party' model is 78 as compared with the 84 percent obtained with the original model. *It is thus clear* . . . that party plays an important role in the performance of the simulation model, . . ." (p. 511, our emphasis). "The memory effect is thus *a slight aid* in the micro level performance . . . (p. 515, our emphasis). "In terms of the manner in which theories can be evaluated, this theoretical model has performed well on the basis of a prediction criterion." (p. 517, our emphasis).

At the risk of being accused of taking words and phrases out of context, we contend that the quoted statements give an illusion of confidence that highly acceptable tests of statistical significance simply do not bear out.

In order to check the effects of model formulations, we subjected Shapiro's data to analysis of variance to determine which formulations were more accurate predictors than others. The difference between "percent correct" of the model and the actual vote was used as the variable in the test of effects. Percentages were transformed by arcsin method.[1] The means thus found are expressed as geometric means in percentage terms. The particular technique of analysis of variance used in our test was that commonly known as "blocks design," a system developed to validate successive tests on a body of data.[2] One of the reasons for using this particular technique is Shapiro's own discussion of the correlation between effects on pages 508 (note 29) and 513.

The analysis of variance *demonstrates no significant* differences between model formulations —F-ratio is 1.45 with 6 and 120 degrees of freedom, $p > 0.5$—but does indicate a significant difference between the bills—F-ratio is 5.76 with 20 and 120 degrees of freedom, $p < .001$. The geometric mean for the various models is: Original model—84.1; Just Party—78.7; Without Party—80.0; Without Constituency—82.1; Without Region—82.7; Without Memory—83.6; and Without Communication—79.1. Geometric means of the individual bills range from a low of 58.8 to a high of 90.8 and a difference of means test among the means for the twenty-one bills shows significant differences (at $p = .05$) in almost one-half of the tests.

Our tests show that the model was significantly more accurate in its predictions on certain bills than on others. The data available to us do not permit any analysis of why this difference occurred but we suggest that Professor Shapiro examine into the question.

In summary, we are not challenging the Shapiro model but on the basis of the data presented in the REVIEW article we do not believe that he has proved his case. By quoting Pool, Abelson and Popkin on the problems of evaluating a complex simulation model (p. 510), Shapiro opens the question of validation to review. Our review suggests that validation has not been shown. Shapiro makes no exaggerated claims for his model, but his caveats do not, we think, totally excuse his failure to carry validation tests to a more acceptable level.

FRANK K. GIBSON
JAMES E. PRATHER
University of Georgia

TO THE EDITOR:

It is unfortunate that the concept of statistical significance, whose meaning relates quite unambiguously to problems of sampling error, has become an approbative term which many social scientists are eager to apply in varying and often inappropriate contexts. Gibson and Prather were unable to find a claim referring to "statistical proof" in my article (the "certain words and phrases" they cited were remarkably free of the language of statistical inference) because there was no appropriate way to consider the representatives, the roll-calls, or even the models tested in my study as samples. Thus the differences I found between my simulation model and each alternative formulation of it could not conceivably have been a result of sampling error. Each difference is a difference whose significance should be evaluated on the basis of its magnitude, not with respect to sampling distributions.

MICHAEL J. SHAPIRO
University of California, Berkeley

TO THE EDITOR:

Apparently the purpose of the exercise by Pulsipher and Weatherby "Malapportionment and Party Competition, and the Functional Distribution of Governmental Expenditures" (this REVIEW, December, 1968, pp. 1207–1219) was to show that ". . . apportionment patterns and levels of political competition are more potent influences than some of the recent literature . . . would lead one to believe" (p. 1218–19). Yet nowhere in the eight tables and assorted findings in the article does one find any evidence to support this conclusion.

Nowhere in the article do the authors assess the independent impact of their political vari-

[1] George W. Snedecor and William G. Cochran, *Statistical Methods* (Ames, Iowa, Iowa State University Press, 1967), p. 327. This transformation is known more familiarly as angular transformation.

[2] For a full discussion of this technique see *ibid.*, pp. 299–301.

ables on public spending, or compare the impact of political and socioeconomic variables. At no point do the authors specify the contributions of their malapportionment and party competition measures to the multiple R^2's for their expenditure measures. At no point do the authors compare the contributions of malapportionment and party competition with the contributions of their socio-economic variables to the multiple R^2's. All they do is discuss the significance of adding the variables in a multiple equation. A commonly acknowledged aspect of multiple regression equations is that one can produce a statistically significant result without making any real gain in predictive ability. (See, for example, William Hays, *Statistics for Psychologists*, Holt, Rinehart and Winston, 1963, p. 536.) The elementary question to raise is what gain in R^2 occurs through the addition of party competition and malapportionment taken separately. These two authors do not tell us, nor do they consider only these two variables taken together. For all we know the social variables rather than political variables could have produced the main increases in R^2? The findings reported in Tables 3 and 5 certainly give indications that this is so.

Moreover, there are a number of strictly technical aspects of their exercise that are difficult to comprehend. For example, are the numbers under the column heading "Constant" in Table 5 referring to the intercept value of Y when X is zero? If so, why are significance levels calculated for these values? Since the value of two intercorrelations determines the necessary lower limit for a third intercorrelation and this lower limit may be greater than zero, why determine whether all intercorrelations are zero? Finally, since a vector rather than individual variables were used, why calculate signifiance levels for each variable? It is relatively easy to obtain significance levels when *t* tests are run on a number of intercorrelations independently.

If the authors would compare the contribution of their malapportionment and party competition measures to the multiple R^2's, with the contributions of per capita income and their other social variables, by means of standardized *b* values or other commonly accepted techniques, they would very likely find that the contributions of these political variables are not as great as the contribution of socio-economic variables. Moreover, if they read with care the earlier works of Hofferbert, Dye, Dawson and Robinson, and others cited in their introduction, they would find that this is precisely what these earlier researchers said.

THOMAS R. DYE
JAMES W. DYSON
Florida State University

TO THE EDITOR:

Apparently the language of our "exercise" was not instructive enough to prevent some misunderstanding of its purpose—at least by Professors Dye and Dyson. The substantive section of their letter (the "nowhere-and-at-no-point" part) suggests a misconception which should be corrected.

Apparently Dye and Dyson interpreted our exercise as an attempt to ascertain whether economic and demographic differences between states were "more important" or "less important" than political differences with respect to "predicting" inter-state variations in expenditure patterns. "At no point" in our exercise do we imply that we were concerned with this question and frankly, we fail to understand why Dye and Dyson concluded that we were. Perhaps they were misled by the skeptical tone of the introduction to our exercise. This skepticism was directed, however, not at the importance of economic and demographic factors, but at what we feel is a *non sequitur* implicit in the *methodology* used by Dye, Hofferbert, and the others referred to in our introduction—namely, that if economic and demographic factors are "more important" than political factors, then political factors are unimportant. Perhaps our rhetoric would have been improved if we had been more explicit on this point, but we just don't find the burning of straw men a very exciting pastime.

As we clearly stated our objective was to "find those expenditure functions which are consistent with [our] hypotheses as we have interpreted them." It should be emphasized that if, as Dye and Dyson suggest, we were to calculate standardized beta values our testing procedure would produce exactly the same results as those in the original article. "Standardizing" regression coefficients changes neither their sign nor their significance level and these two characteristics were the criteria used to accept or reject the hypotheses with which we were concerned.

We are sorry that Dye and Dyson apparently experienced some difficulty in comprehending "a number of strictly technical aspects of [our] exercise." We think we can help them with both of those that they mention. Their first difficulty is comprehending why we included the significance level of the constant term of our regression equations in Table 6. The reason that this was done is that it was an output of the program we were using. It is a meaningful datum which can be used to make inferences. We did not make use of it in this exercise but we have in others. Its calculation and inclusion in the table has no effect upon our results. Apparently Dye and Dyson's second difficulty is the result of their misunderstanding of our use of the term "vec-

tor." We used this term in the way it is traditionally used in statistical analysis. The individual social and political variables are merely the components of the vector. We calculated the significance level of the vector and of each of its components because the testing procedure we used stipulated that both these values exceed a specified value.

Southern Illinois University
JAMES L. WEATHERBY, JR.
University of Minnesota

TO THE EDITOR:

The practice of using a book review as a vehicle for the presentation of views on topics not necessarily concerned with the book being reviewed has been consecrated by immemorial practice. It is unfortunate perhaps in the light of the information explosion, but a fact of life nevertheless. The reviewer of my book *Governing the Commune of Veyrier: Politics in Swiss Local Government* (APSR, Vol. LXII, No. 4 [December, 1968], pp. 1374–1375) has gone too far, however.

According to the rules I cannot complain that he has used my small book as a vehicle for the presentation of highly debatable impressions of Swiss political life. Note for instance the shocking statement: ". . . Swiss politics are today dominated at every level by a concern with the maintenance of precarious religious, linguistic and political equilibria in the face of burgeoning Catholic birth rates and immigration by foreign workers . . ."

Under the rules of the game I probably do not even have the right to complain that despite the generous length of the review he missed completely the point of the book and the series of which it is a part. There was no intention to make my book a comparison of the Swiss local governments. It is, as amply pointed out in Professor Buechner's introduction, a descriptive case study of the administration (and politics) of a specific local government in Switzerland, nothing more. It is our feeling that at present there are too few case studies of local government. Only when we have collected enough such studies can a meaningful comparative study of local governments be made. We believe in starting at the beginning.

I do take strong objection, however, to the reviewer taking words out of context, that put the book in a completely false light. The keystone to the entire review is his statement that I chose the commune of Veyrier "as a 'political microcosm' of Switzerland (p. 23)." This statement is patently false. No such statement is made on page 23 or anywhere else in the text including Professor Buechner's Foreword. All that is said in page 23 is that: "In many respects the political party system in Veyrier is a microcosm of that found in the canton of Geneva and even of that in the nation as a whole." I then go on to spell out some of the similarities and the *differences* between the Veyrier political party system and the larger units. Using this misrepresentation as the key to his review, the reviewer then proceeds to make a number of criticisms. The criticisms are not necessarily criticisms of my book, however, and should be labeled as such in order not to give the reader of the review a completely false impression of what was attempted and what was accomplished.

GEORGE A. CODDING, JR.
University of Colorado

TO THE EDITOR:

It seems making altogether too much out of Professor Codding's modest little book to write a counter-critique of his critique of my review of his monograph. If he did not wish his book to be reviewed comparatively he perhaps should have chosen a less suggestive title than *Politics in Swiss Local Government,* he probably should have abstained from the controversial analogies hazarded from time to time in the text (the word 'microcosm,' whatever the context, remains provocative), and he certainly should have dissuaded John Buechner from introducing his book as "the first in a series of publications dealing with comparative public administration" in a Foreword which, while it does not contain Codding's phrase "descriptive case study," does employ the word comparative eleven times. His own rejoinder characterizes his approach as one of "spelling out some of the similarities and differences between the Veyrier political system and the larger units"; surely this is the very essence of comparative political analysis.

In any case, the point of my review was not to scold Professor Codding for failing to accomplish what he apparently did not intend to undertake, but simply to regret—in light of the undeserved negligence with which Switzerland has been treated by American political scientists —that the results of his careful research were so cautiously circumspect, and the scope and thrust of his generalizations so exceedingly limited.

BOOK REVIEWS

Political Research and Political Theory. Ed. by Oliver Garceau. (Cambridge: Harvard University Press, 1968. Pp. 256. $7.95.)

The late V. O. Key in whose memory the essays in this volume were written was a "data man." One might expect, therefore, that his memory would be honored by writing and research in the empirical tradition that he did so much to advance, not by preaching but by practicing it. Yet, only two of the chapters, "Micro- and Macro-politics: Notes on Research Strategy," by Douglas Price, and "State Party Systems and Policy Outputs," by Duane Lockard, satisfy the criteria of an empirical politics that guided Key's own work. Incidentally, Price and Lockard are the youngest contributors to the volume. Two other essays, "The Concept of 'Party'," by Austin Ranney, and "The Comparison of Western Political Parties," by Leon D. Epstein, though more conceptual than empirical in content, are at least inspired by Key's work. And these two are, in age, the next youngest. I leave it to the reader to draw his own conclusions about Key's influence on contemporary political science.

Now, what bothers me about this volume is not what bothers most reviewers of symposia, namely, that they are more often than not grab-bags of unrelated, heterogeneous intellectual goodies. In fact, I like both grab-bags and goodies, and I enjoyed reading all the goodies in this particular grab-bag. What bothers me is that some of the distinguished authors here assembled know quite well what V. O. was all about and then proceed as if it made no difference. At least some admit their intellectual discomfort with uncanny candor. Avery Leiserson, for instance, informs us that "both in his professional work and personality, V. O. Key exhibited a 'briny irreverence' toward empiricist and rationalist pretensions alike, as well as to the moral agonizing of the value-oriented schools of political philosophy, that is a healthy antidote to premature integration in theory-building." (p. 24) But this understanding does not save Leiserson from the temptation of doing just what V. O. would not have done in a rather ethereal essay on "Empirical Approaches to Democratic Theory."

M. Brewster Smith, the only non-fraternity man in the volume, reports being "keenly aware of Key's rare talent for grasping the Elephant whole without recourse to such arid conceptual baggage. It was part of Key's artistry to keep much of his conceptual sophistication implicit, as he brought empirical analysis shrewdly to bear on theoretical and normative problems." (p. 79) But Smith's contribution, "Personality in Politics: A Conceptual Map, with Application to the Problem of Political Rationality," is a formidable excursion into the labyrinth of conceptual mishmash. What, let us wonder, would V. O. have thought about a paragraph like this?

> The remaining functional basis of attitudes, mediation of self-other relationships, is neutral in rationality from this processual perspective. The motivational agenda that it implies has nothing intrinsically to do with how the person appraises the bearing of a focal object or issue on his interests and values, but neither does it necessarily operate at cross-purposes with rational object appraisal, as is the case with externalization and ego defense. And we shall see that there are conditions under which it may lead to decisions which, as products, must be judged as rational. (p. 95)

Even Douglas Price seems uncomfortable. Referring to the second part of his piece that deals with the problems of relating individual, group and aggregate data, and reductionism, Price points out that "the latter two topics are doubtless rather more abstract and methodological than Key would be enthusiastic about." (p. 104) And Leon Epstein, in his gutsy article that suggests testing some of the hypotheses about American parties and elections in European nations, implies that V. O. might have taken a dim view of the enterprise: "Understandably, Key's criterion was simply what seemed relevant in the United States. His subject matter, after all, was virtually all American." (p. 168)

Equally bothersome to me is the editor's apparent assumption that the problem of the electorate's "rationality" was of enduring, pervasive and compassionate concern to Key, in commissioning two essays dealing with the question of rationality. *The Responsible Electorate,* though V. O.'s last work, was also his weakest work, and I doubt that he will be remembered for it rather than for *Southern Politics* or his influential textbook. That J. Roland Pennock, in "Political Philosophy and Political Science," and Frederick M. Watkins, in "Natural Law and the Problem of Value-Judgment," come out with opposite interpretations of Key's "philosophy" is not surprising. In opening his essay, Pennock asserts that Key's "posthumous book, *The Responsible Electorate,* underlines what all who were familiar with the man or his work well knew; that his concern for the scientific study of politics was paralleled by an equal concern

for a particular set of political values, those we associate with liberal democratic institutions." (p. 39) But Watkins writes: "Political theory was a branch of political science in which V. O. Key, to judge at least by his publications, was not much interested. This was no personal idiosyncracy, but was typical of the times. . . . No man with the talents and interests of a V. O. Key could have been expected to pay more than passing attention to problems of this sort." (pp. 58–9)

Finally, it seems to me unfortunate that some of the authors dig up some of Key's most dubious epithets to make their own intellectual stance more palatable. For instance, Merle Fainsod, in "The Dynamics of One-Party Systems," finds comfort in Key's statement that "the aspirations which find their focus in one-party rule are rooted in deep-seated human drives." (p. 222) Even Duane Lockard repeats the bromide that research on the social determinants of voting "threatens to take the politics out of the study of electoral behavior," (p. 211) only to be contradicted by Smith to the effect that "social determination is by no means incompatible with political rationality." (p. 100) V. O., of course, rarely permitted himself to become the prisoner of his own cliches. Over the long haul, I think, he will not be remembered for his *obiter dicta* but for his formulation of novel, imaginative and empirically tested hypotheses about political behavior and processes.

All this is not to say that this is not a worthwhile compendium. On finishing it I asked myself, "of what use to me is a book like this?" The virtue of this book consists in one's seeing one's colleagues grapple "in public," as it were, with very private scholarly concerns. This is especially true of the essays by Leiserson, Price and Ranney which I found most interesting precisely because they remain "open-ended." Pennock and Watkins reassured me that, their own efforts notwithstanding, the fact-value problem is still pretty much where it was when I went to school. Price struggles with the unresolved problem of units and levels of analysis, and Lockard quantifies with a healthy respect for nonquantifiables. Fainsod makes a heroic effort to compare five probably non-comparable "cases" (not types, as he says) of one-party rule, and Epstein sticks his neck out by not indulging in the verbal gyrations of the functionalists. In short, we have a long way to go. Political scientists are still riding off in many directions, evidently on the assumption that if you don't know where you are going, any road will take you there.

Stanford University

TANU Yajenga Nchi, Political Development in Rural Tanzania. By GORAN HYDÉN. (Lund, Sweden: Scandinavian University Books. 1968. Pp. 282.)

The title of this study reflects the fact that we are now faced with a "third wave" of political studies in Africa, and perhaps in other developing parts of the world, as well. It is fitting that concern with micropolitics in Tanzania should be heralded by a slogan, "TANU builds the country," in Swahili, the *lingua franca.* The author, a Swedish political scientist, also performs a much-needed service in the same vein, by supplying a Swahili summary at the end of his book. For it is among the villagers of the new states, the non-speakers of European languages, that investigators must seek better understanding of new political institutions and new directions in policy. The first "wave" of scholarship broke the paths and cleared the ground, so to speak. (Coleman, Apter, Morgenthau, Wallerstein and the three volumes edited by Carter), while the second posed several critical questions and began a process of re-assessment (Zolberg, Kilson, Sklar). Both "waves" proceeded largely at the elite, national, and even international level—macro-studies. The micro-studies are just beginning to emerge. Indeed Tanzania will be the first African state probably to be blanketed by studies of village politics after independence.

Mr. Hyden brings skills and ambition to his task, much to be admired. He knows Swahili, although he employed an interpreter in interviewing, he lived in Bukoba, the "metropolis" town for the five rural parishes he visited and investigated, he immersed himself in the local history, he developed and supervised an attitude survey in inauspicious surroundings, and he attempted to link his case study to extant hypotheses and approaches of contemporary students of political development. The result, however, is not woven together very well, although an overall design is apparent, derived from the Shils-Eisenstadt approach to political development in terms of center and periphery and from the analysis of developmental processes via a focus on system capabilities and political culture, worked out by Almond and Verba. (On page 22 Hyden offers us one of those marvelous diagrams which outlines everything going on in a political system.) In laying out the political history of Buhaya (the area of traditional habitation in question), in the report of the attitude survey, and in the sections testing and referring to more general hypotheses and analytical suggestions, one is reminded of a comment by A. J. P. Taylor on American Ph.D. theses: "so much raw meat, not enough cooking." Hyden writes clearly, but woodenly—of

course, English is not his native language. He seems to have made a deliberate choice not to give us "the feel" of Buhaya. Certainly, manifestations of Tanzanian politics do not come alive in this rural north-west corner of the country, the way they do in the writings on Tanzania of several of the authors cited in the extensive notes and bibliography.

But Mr. Hyden's book is noteworthy for its devotion to incremental gains in political science, for the challenges it throws up to a number of grand generalizations about the nature of political development, and for his completely open and honest effort to do what has to be done if we are ever to know much about the political behavior of exotic peoples.

Basically, Mr. Hyden shows that TANU, the monopolistic party-government of Tanzania, has been an agency of political development, as far as the input side of the emergent political system is concerned. Although generalizations must be restricted to the linkages between this corner of the country and a national Tanzanian political system, it appears that the national government is increasing its capacities to deal with internal challenges. Among the Haya people a strong feeling of identity with the nation exists, the regime is regarded as legitimate, and elements of a participant culture are now recognizable. The relationship between the Haya and the Tanzanian nation seems to be illuminated by analyzing their political behavior in terms of a subject culture, retaining elements of weak parochialism and developing forces of participation. While there is some interesting corroborative evidence here, a reader might suspect that the frame of reference shaped the conclusions. Mr. Hyden is modest and attractively uninsistent, but his desire to incorporate wholly the threads of systems capability analysis sometimes obstructs a convincing conclusion, at least for me.

There are, however, other valuable aspects of the study. Although my presentation may telescope a somewhat more complicated argument, Mr. Hyden offers more evidence for the notion that parochialism *per se* need not undercut "nation-building." A degree of cultural fragmentation before serious social differentiation can even facilitate national assimilation, if a national mobilizing force, such as the monopolistic party, enters the scene at the "premature" moment. In other words, one can argue that cultural secularization proceeding out of phase, so to speak, with the forces of commercialism and social restratification, can yield raw material for the nationalizing of sentiment, if the effective instrument is wielded by nationalizing leaders. At a lower level, here is also an explanation for the success of TANU. It entered the picture before economic and social differentiation was very serious, so it was able to capitalize on inevitable discontents and transfer emergent loyalties.

Concerning the whole question of the putative gap between tradition and modernity, Mr. Hyden provides material for arguing in a different vein. At least for the Haya, the thinking of the young and the old on a variety of matters of political significance is not so far apart; nor are there such great differences between the political reasoning of villagers and the national spokesmen on certain questions of policy. Villagers are resistant to the build-up of extractive strength of the national government and are making demands for more rewards—and more obvious ones—but, as Mr. Hyden deftly shows, for certain poorer farmers, it is "rational" to oppose improvement schemes and the like until there is further progress on the welfare front.

Among a few other suggestive points, one stands out. The mass media do not seem to be the principal progenitor of increasing expectations of life. The evidence here, coupled with the quoted evidence of a similarly-focused short study based in Uganda, seriously challenges earlier hypotheses about the "passing of traditional society."

The overall picture, nevertheless, remains one of descriptive and analytical austerity, and needlessly so, since the author has published at least two articles on political behavior in Buhaya, which enrich our understanding of matters such as, the relationship of families of chieftainship to present-day politics, and some social variables in leadership recruitment and support for TANU. In the present study, a number of possibly revealing inquiries are left dangling. Why, for instance, was there no relationship between Haya in faraway towns to the emergence of a Haya "tribal" identity before the rise of nationalism? Other groups, such as the Chagga, displayed significant inter-connections between emigrant and local modernizers. Does it have something to do with the "consummatory" value system attributed by Hyden to the Haya? But if that is the case, and this relates to the Apter thesis of consummatory values hindering modernization, why is there not more difficulty in absorbing the Haya into national political patterns?

My point here is not to try to invalidate Mr. Hyden's arguments, because I don't think anyone can fully grapple with them without enrichment that he probably could have provided by broader discussion of the issues raised by his own evidence and deductions. I believe, for example, that he overestimates the mass character of TANU in the middle 1950's, and that he underestimates some of the coercive nature of

"monopolitical" conditions in Tanzania today. Perhaps a broader-based discussion of politics in Buhaya at the time of the 1958 election and development of the problem of the political role of the Church, admittedly important, would have helped.

Whatever the omissions, this is a piece of basic and genuine research, and is much to be applauded.

HARVEY GLICKMAN
Haverford College

Legislative Issues in the Fifty States: A Comparative Analysis. By WAYNE L. FRANCIS. (Chicago: Rand McNally & Company, 1967. Pp. 129. $4.95.)

One should not be deceived by the brevity of this volume. In it Professor Francis has compressed an intricate report of research, substantial theoretical insight, and considerable methodological reflection. In its breadth of focus the study represents a notable departure from most legislative analysis and must occupy a central place in the growing body of genuinely comparative studies of American state politics.

In addition to its comparative focus, the study departs from most analyses of legislative behavior by training the lens on the policy issues of state legislative activity. Studies of roll-call behavior and most interview-based inquiries have usually concentrated on the *processes* of state legislatures rather than upon their *policies*. Professor Francis does not ignore processes, but rather he views them in terms of their consequences for specific areas of public policy.

The data for the study were obtained from questionnaires mailed to a 1,600 member sample of the more than 7,000 state legislators serving in 1963. Useable replies were received from 838 legislators. To the extent that the sample could be validated (in terms of partisan composition and balance between senates and houses) it conformed quite nicely to the actual composition of the universe of legislators. The author is sensitive to the limitations of his data base without being unduly inhibited by them. The extent to which readers may entertain doubts about the reliability of the information for descriptive purposes should not detract substantially from the contributions of the study to theory construction.

The respondents were asked to characterize "important issues" (of their own selection) in terms of several dimensions: *interest* on the part of significant actors (the governor, news media, pressure groups, etc.); types of *conflict* (partisan, factional, pressure group, regional); the *resources* involved (money, level of government, length of public commitment); the expected *impact* (on numbers of people, prior policies, and future commitments); and the fate of the issue (passed, amended, defeated). In effect, the book unfolds as an explication of the matrix of interrelationships formed by the legislators' perceptions of these dimensions of issue characteristics. If for no other reason, the volume would be worth careful examination for the interesting and imaginatively constructed indices used to measure these characteristics.

Another useful aspect of the book is the manner in which Professor Francis is able to differentiate between policy areas in terms of the characteristics or, if one likes, the *structures* of policy. Thus certain types of policy are marked by partisan conflict, e.g., election laws, labor issues, and land policy. Other types of policy are found more frequently to display intra-party factional conflict, e.g., liquor laws, constitutional revision, and agricultural policies. Although the findings and analysis suggest several interesting alterations in current knowledge of the various dimensions of legislative behavior, they are sufficiently consistent with the theory presented to bolster confidence in the reliability of the data and the soundness of the interpretation.

From one standpoint, the major qualification of the study is a matter of research design rather than of data. It has the shortcoming of nearly all legislative studies in that it tells us little of the relevance of the legislature, as such, vis-à-vis other policy-making instrumentalities. In an effort to identify the points of genesis of major issues, Professor Francis asked his respondents, "In your legislature, where would you say the most significant decisions are made?" The alternatives provided in the questionnaire included party caucus, floor, substantive committee, pre-legislative session, policy committee, governor's office, and "other." If one's concern is with the genesis of policy rather than with the infra-structure of legislatures, this mode of inquiry may unduly inflate the relative role of the legislature. First of all, the fact that legislators are the subjects being queried biases the responses in favor of legislatively related arenas of policy initiation. Secondly, the alternatives do not explicitly provide for assigning initiatory status to any of several extra-legislative instrumentalities such as the bureaucracy, interest groups, party mechanism, or the federal government.

The final chapter, "Some Tentative Theorizing on Legislative Policy-Making," moves the analysis into an integrated context. In the framework of coalitional theory, Professor Francis examines the determinants of partisan conflict, factional conflict, and policy success. In the course of this explication, he is able to offer

some suggestive refinements of current comparative state studies as they concern the relevance of political system variables to policy content. His analysis suggests that we may find certain short-term (but all the same consequential) effects of such system characteristics as partisanship and competitiveness on the content and fate of public policy. If his suggestions are followed out in further research, there may yet be modest solace for those who are discomfited by studies such as Thomas R. Dye's *Politics, Economics, and the Public* which discount the relevance of political variables compared to socio-economic factors in policy determination.

Throughout this volume, Professor Francis assumes a high level of technical and methodological sophistication on the part of his readers. Those willing to stay with it will discover an on-going movement between theory, propositions, and data which provides a rich and challenging context for each subsection. One is continually prodded to think at least two or three steps beyond the data at hand. This process has the advantage of providing the reader with a sustained sense of the import and empirical relevance of that with which he is confronted. The price is paid in occasional inundation by hypotheses and sub-hypotheses. Comprehension, however, is facilitated by useful summaries at the end of each chapter. The book does not make for easy reading. It is devoid of rhetorical frills. Six words are never used where three will do. But despite its astringency, this volume must be considered both a significant contribution to our understanding of legislative policy-making and a stimulating guide to further inquiry.

RICHARD I. HOFFERBERT
Cornell University

Comparative Politics: A Developmental Approach. By GABRIEL A. ALMOND AND G. BINGHAM POWELL, JR. (Boston: Little, Brown and Company, 1966. Pp. 348.)

This book is an elaboration of the structure-function paradigm first applied in 1960 by Gabriel Almond and James S. Coleman to the study of non-Western politics. In this latest formulation, Almond and G. Bingham Powell, Jr., postulate three levels of functions performed by all political systems: 1) system capabilities, 2) conversion functions, and 3) system maintenance and adaptive functions. System capabilities are the set of all relationships of a political system with its environment; they are the "outputs" and include extraction, regulation, distribution, symbolic output, and responsive capability.

Conversion functions operate prior to system capabilities, converting inputs into outputs, demands and supports into capabilities. They include articulation of interests and demands, aggregation of interests into policy alternatives, conversion of policy alternatives into authoritative rules, application of rules, adjudication of rules, and political communications.

System maintenance and adaptive functions include political socialization and recruitment, the mechanisms by which the political system adjusts itself to varying inputs and demands from the surrounding environment.

These thirteen functional concepts are joined by another key concept: political culture. While political culture is not a function as such and not logically linked with the thirteen functions, its inclusion by the authors serves to remind the reader that attitudes and desires of individuals, either as single actors or as "the public," are still legitimate objects of study even for the student of system-level phenomena.

Equally as interesting as the postulation of thirteen political system functions is the authors' discussion of political development. Political development, Almond and Powell state, characterizes a political system undergoing structural differentiation, cultural secularization, and increased sub-system autonomy as it meets the problems of state-building, nation-building, participation, and distribution. By hypothesizing that structural differentiation and cultural secularization tend to covary, the authors are able to create a two-dimensional space with these two properties describing the vertical axis and sub-system autonomy describing the horizontal axis. On this space are arrayed a wide variety of political systems from primitive bands through bureaucratic empires to high autonomy democratic systems. In the accompanying text one finds a more detailed description of sixteen types of political systems grouped as primitive, traditional, and modern.

A useful feature of this scheme is that it accommodates totalitarian systems in the developmental context: while both democratic and totalitarian systems are high in structural differentiation and cultural secularization, the totalitarian system is distinguished from the democratic by its low level of sub-system autonomy.

Having attempted in 1967 to apply the Almond-Powell scheme to Hong Kong politics, this reviewer concludes that it is adequate as an inventory of significant descriptive topics but inadequate as a rigorous analytical framework. The scheme seems vulnerable to the following criticisms.

First, the thirteen functions and the two key concepts of political culture and development are not systematically related to one another.

The book falls easily into chapters on the functions and concepts, each of which can stand by itself, but the "Overview" fails to provide the logical cement to hold together the functions and concepts in an articulated, comprehensive theory.

Second, the thirteen functions are inadequately related to the notion of system survival. The authors do not satisfy the reader that each function is equally vital or that the number of functions could not be increased or decreased. Further, the authors avoid offering a definition of system survival, thus leaving the reader unable to varify the authors' assertion that the given thirteen functions—and no others—are necessary for system survival.

Third, given Almond and Powell's guidance the separation of a given function from the structure which performs it proves to be difficult in practice. This is not surprising in view of the fact that Almond, in arriving at his original list of functions, looked first at working institutions in Western nations and asked himself, "What functions do these structures perform?" With this starting point it is hard to abstract and discuss a function without reference to structures which perform it, for the structures are the concrete indicators by which the abstracted function is detected in the real world.

Fourth, the authors fail to provide accurate, unambiguous, and parsimonious specifications of the dimensions of each postulated function and concept. For example, they describe political culture in terms of types of orientations, intensity of orientations, directions of orientations, frequency of orientations, objects of orientations, congruence of orientations with structures, degree of secularization, and so on. Do these dimensions, already so numerous as to be cumbersome, exhaust the possibilities?

Fifth and finally, the authors supply too few demonstrations of how their concepts could be operationalized for use in empirical research. This reviewer relied on his intuition in operationalizing such concepts as degree of cultural secularization and mood of political communications, receiving little guidance from the creators of the scheme.

To be fair, one must see the above criticisms in light of Almond's 1965 caveat that his scheme is

> more than a classification of variables and less than a theory of political systems. . . . [It is] a proposed first step towards constructing a theory of the political system and of the development of political systems.

The Almond-Powell scheme is useful as a statement of ideals even though it falls short in application. It reminds researchers of the necessity to acknowledge the interrelatedness of political phenomena and to see particular phenomena in the context of the larger environment. And it draws attention to the non-Western and developmental political processes. For these reasons it deserves consideration . . . and invites improvement.

STEVE HOADLEY
Washington University, St. Louis

Expansion and Coexistence: The History of Soviet Foreign Policy 1917–67. By ADAM B. ULAM (New York: Frederick A. Praeger, Inc., 1968. Pp. 775. $12.95.)

Since 1930 when Louis Fischer provided us with a full scale history of Soviet foreign policy no one has been bold enough to write an up-to-date treatment of the subject. And no wonder! Fifty years packed with events in many of which the Soviet Union played an important role; the absence of all but the meagerest Soviet documentation and an imperfect understanding of how Soviet internal policies relate to foreign policy—all seemed like insuperable obstacles. Mr. Ulam is to be admired for his courage and to be congratulated for the success with which he has carried off the undertaking. *Expansion and Coexistence* is comprehensive, based on a clearly articulated theoretical structure, and, what has become so rare, interesting to read.

Although the book is comprehensive it is not exhaustive. If Mr. Ulam had imposed the condition upon himself of reading everything relevant, he could not have completed the task and we should all be the poorer for it. On some matters others will inevitably disagree with Mr. Ulam's interpretations, but the basic structure of the book is sturdy and will survive the revisions to be produced by further research or new revelations. The book is solidly based on a theory about the relationship between ideology and national interest and the interrelationship between foreign and domestic policies. Mr. Ulam avoids the familiar but sterile opposition of national interest to ideology. Instead at appropriate points he describes the amalgam of belief, experience, acuteness and misperception which underlay Soviet calculations. For example, he describes quite convincingly how the destruction of the political system of Europe in World War I convinced the Bolsheviks that they could afford to be much more optimistic about the demise of capitalism than Marx had been. It was not necessary to wait for a proletariat superior in strength to achieve power. War could so shake the old society that a weak proletariat could take power as indeed they had in Russia. On another level, Mr. Ulam argues that the

tactics dictated by Moscow to the German Communist Party before Hitler's accession to power derived from the Bolshevik's own experience when out of power. Since the Bolsheviks had reserved their hardest blows for the other parties on the left and had later come to power, the German communists should, they believed, obviously emulate that example. That men tend to universalize the applicability of their own successes is a familiar idea, and hardly peculiar to socialist societies but eminently serviceable nonetheless. Herein lies the power of Mr. Ulam's analysis. His Bolshevik sees the world through the lens of communist theory about the world (whose permutations over time are taken into account) and acts out of habit, hope and fear. Mr. Ulam's Soviet decision maker is very human and very convincing.

Mr. Ulam is also very good in dealing with the relationship between internal and external policy. At times, he argues, the threat from abroad is artificially inflated to justify a harsh policy at home. Mr. Ulam argues interestingly, and uniquely, if memory serves, that in 1945 and 1946, Stalin was quite relaxed about the danger from the West (*vide* radical demobilization) but was concerned about his ability to maintain control within the country without a reimposition of severe controls. Hence an artificial war psychology. The analogue is the artificial war scare of 1927 which was Stalin's preparation for the campaign of collectivization and industrialization. (p. 165) (Yet on p. 439 we read that the "Soviet leaders were on the point of convincing themselves that . . . Baldwin and Chamberlin were about to launch a new intervention in Russia." This is the only such slip I noted.)

It is precisely because Mr. Ulam has the advantage of the long view that he knows what is missing in periods where the documentation is poor. This makes it possible for him to avoid the crude errors that arise from focusing on a single period, and permits disciplined speculation at other times. Thus he rejects the question of who was "responsible" for the cold war. Given the state systems that then dominated the world, (pp. 398–399) it seems inescapable to Mr. Ulam that these systems came into conflict. What interests him is the particular nature of this conflict. His main thesis is that in the early period of the cold war Stalin was so conscious of his own weakness, that he presented a bristling front to his opponents which had the virtue of keeping them off balance but the defect of causing them to consolidate their forces. Mr. Ulam suggests that at particular points Stalin tried to signal an intention to parley but he was so afraid of revealing weakness and, thus, so indirect that the opponent missed the cue. On the other side, in one such instance in 1950 Acheson asked "for welcome and tangible proof that Soviet intentions have changed." "Thus," remarks Mr. Ulam, "near the end of his days, Stalin was called upon to perform a rite he had so often inflicted on others: confession and recantation." Mr. Ulam does not try to make the vulgar point that the cold war could have been liquidated if one or the other party had been psychologically more astute and forthcoming. His point is rather that differing perceptions and internal necessities created the modalities of the cold war which in turn was determined by a basic conflict of interests.

On only one major point does the reviewer differ with Mr. Ulam, namely, in his assumptions about the balance of military force between the Soviet Union and the United States. In my opinion, Mr. Ulam places the Soviet achievement of rough nuclear parity with the United States far too early. For example (p. 498) he firmly states that the Western position vis-à-vis Russia would never be as strong as it had been in 1950. As a matter of fact in 1950 it would have been at least several months before the United States could have bombed the Soviet Union very extensively with nuclear weapons. As subsequent congressional hearings revealed, the United States had very few nuclear weapons before the Korean War and very indifferent delivery vehicles. By the end of the Korean War part of the thirty-six billion dollar annual increase in the budget had gone into a nuclear arsenal *and* improved aircraft. Mr. Dulles's statement of the American capacity in January 1954 to bomb the Soviet Union massively and instantaneously was no less than the precise truth. Since the Soviet Union was not in a position to retaliate in kind until at least six or seven years later, the Soviet military theorists were quite naturally preoccupied with subject of surprise attack and active air defense.

But Mr. Ulam is correct when he writes that in the immediate post war years the United States exaggerated Soviet military strength and therefore her proclivity to make war. However, he anticipates the improvement in the relative position of the Soviet Union and thus distorts his analysis of the Cuban missile crisis. Mr. Ulam's reconstruction, which he describes with his customary discrimination about the basis of his judgments as "entirely conjectural" (p. 644) will probably cause more controversy than anything else in the book. Mr. Ulam's thesis briefly is that Khrushchev wanted a favorable resolution of the Berlin crisis and a guarantee against the West German acquisition of nuclear weapons. By offering to remove the missiles which had been installed in Cuba, he could gain these

two objectives and proceed to a third on the basis of this victory; to persuade or force China to renounce nuclear weapons and make a general settlement with the United States. As usual Mr. Ulam has seized the right end of the stick. He demonstrates the utility of the concept of the triadic Soviet-Chinese-American relationship which is surely one of the keys to Soviet foreign policy in the sixties. Perhaps Mr. Khrushchev was sanguine enough to wave aside historical experience and to believe that a mere crisis rather than a war could produce such a global package deal. But Khrushchev knew, as Mr. Ulam does not, how poor the relative Soviet military position really was. For him the improvement of the military balance was a *sufficient* reason for the installation of intermediate range missiles in Cuba. Despite the missile gap talk of the election campaign of 1960, in 1962 the Soviet Union was still far behind the United States in intercontinental missiles. Of course, Khrushchev hoped and Mr. Kennedy feared that political changes would follow the shift in the strategic balance but the heavy pressure for the Soviet Union to get a short cut to "parity" was enough reason for the Cuban gamble.

Although every reader will have particular points of difference with Mr. Ulam, the whole can only excite admiration and, it is to be hoped, emulation.

HERBERT S. DINERSTEIN
The Johns Hopkins University

110 Livingston Street: Politics and Bureaucracy in the New York City Schools. By DAVID ROGERS. (New York: Random House, 1968. Pp. 584. $8.95.)

Contemporary empirical research offers a choice between two general strategies. On the one hand, the investigator may test hypotheses, focus sharply, collect specified data, and concentrate on explanation, showing relationships among only a few aspects of several situations or systems. On the other hand, he may explore thoroughly, focus more diffusely, collect as much information as possible, and concentrate on description, illuminating many aspects of a single situation or system. David Rogers has chosen the latter strategy to examine politics and bureaucracy in the New York City school system and has demonstrated that the case study, however unfashionable and whatever its limitations, is still an extremely productive means of analysis. Given the nature of his objectives, the complexity of educational politics, and the inscrutability of the target, Rogers adopts an eclectic approach. Instead of pursuing one theoretical path, he concentrates on several sets of factors that shape the politics and administration of school desegration in the city and treats each of them from a different perspective. After years of personal observation and more than one thousand interviews, he analyzes a vast amount of information with great care and skill. The result is the most exhaustive and thoughtful study of school politics to date.

One of the author's principal concerns is describing the strategies, tactics, and effects of interest groups that pressure the school system. Examination of the activities of these groups reveals much about pluralism, factionalism, and stasis in New York. With regard to school desegregation, status-quo forces were advantaged. The neighborhood school movement had only to mobilize local support on a few occasions to exert a lasting impact on the anticipations and behavior of educational leaders. Civil rights organizations, by contrast, had to sustain grass roots support and press continuously. This was exceedingly difficult, because of a lack of unified leadership, overly complex goals, and a conflict strategy lacking appeal to a wider public. White liberal groups were ineffective. Their leaders, practicing traditional logic, were unable to conceive practical solutions and their members, threatened by Negro demands, were less than enthusiastic. The balance of group power was held by moderate organizations. But they were unwilling to risk sacrificing quality education for equal education, and consequently did little. This description of competition among, and within, groups in a pluralistic and politically fragmented city lends additional support to an important proposition concerning organizations. The more highly differentiated, and the more unstable, the social setting, the less salient it will be, and the less salient the setting, the more salient the organization itself.

If this is the case, then those within an organization retain significant discretion in the formulation and administration of policy. Describing the exercise of such discretion is the second principal concern of Rogers. There is a tendency among political scientists to concentrate on the adoption of policy, to the neglect of its execution. Yet, as Murray Edelman suggested several years ago, there are differences between the symbolic, nontangible values allocated by policy makers and the material, tangible values allocated by administrators. Rogers, in what I consider the most important part of his study, treats these differences in considerable detail. Despite advanced policy statements promulgated by the school board, implementation was customarily delayed or vetoed by professionals inside the system. Virtually every program adopted at the higher levels, the author frequently points out, failed as lower levels exer-

cised their negative powers. Such subversion could occur repeatedly, mainly because of the rigidity and defensiveness of a bureaucracy in a system of arbitrary and chaotic centralization, undercontrol and decentralization by default, vertical and horizontal fragmentation, parochial codes and compulsive rule-following, and an extreme diffusion of effective power.

It is difficult to fault Rogers' descriptions of the New York City school system. But his evaluations are necessarily more controversial. One reason is that the wealth of reported information lends itself to somewhat varying interpretation, depending largely on one's professional judgments and social values. He is critical of the board of education for operating in isolation, urging that it become more responsive and permit the public greater power to set policies. Nevertheless, he takes the board to task for studying plans and holding public hearings, on the grounds that such delays reveal the board's own indecision and stimulate cross pressures. At one point, he suggests the utility of private discussions between the board and reform groups, rather than ceremonial public hearings held to give the appearance of consultation. At another, he criticizes the private nature of meetings between the school superintendent and civil rights groups, paying little attention to how their negotiations led to reformulations of a desegregation plan. Although he acknowledges the liberal intentions of most board members and presents arguments in their defense, the thrust of his evaluation is that they did very little to overcome opposition and even engendered it. Yet, another investigator, studying the same school system at about the same time, could evaluate things quite differently. "One fact is clear," Bert E. Swanson writes, "school officials are willing to try various methods and workable plans for integration" (*The Struggle for Equality*, p. 7). Certainly, school officials had options, but I disagree as to whether the board had more freedom to innovate than it cared to exercise. The board went as far and as fast as it reasonably could. In view of demographic factors and private economic decisions, the city's pluralism and political fragmentation, the always latent and occasionally active conservatism of neighborhood groups, and the strenuous opposition of the school bureaucracy, the board was actually more venturesome than might have been expected.

Still, the board has been less than successful in its attempts to innovate. How much less? One difficulty with the case study approach is that there are no convenient standards for evaluative use. In the New York City school system change has not been accomplished rapidly or easily, but some progress has been made. In addition to those subverted policies on which Rogers dwells, a number of other changes have been adopted and tried—the beginnings of a program-performance budget, the promotion of increasing numbers of Negroes to supervisory positions, a revision of the structure and procedure of the board of examiners, human relations training for school staff, greater stress on early-childhood programs, and curriculum revision. Do these changes, among others, denote some degree of effort and, if so, how much? Subjectively, the relevant question is whether more or less has been attempted than our social values dictate. The author's conclusion is that efforts have been minimal compared to the level of social needs and the legitimacy of civil rights demands. Objectively, the relevant question is whether more or less has been attempted in one school system than in others. The reviewer's guess is that efforts in New York have been considerable compared to those in most other cities.

It would be surprising if a reviewer's judgments consistently coincided with an author's. My few reservations are not meant to challenge the contributions of this remarkable work. The book adds to our theoretical and empirical knowledge of politics and bureaucracy, and for this I am personally indebted. It contributes to discussion and understanding of a major social problem, and for that we should all be grateful.

The Interpretation of Agreements and World Public Order: Principles of Content and Procedure. BY MYRES S. MCDOUGAL, HAROLD D. LASSWELL, AND JAMES C. MILLER. (New Haven: Yale University Press, 1967. Pp. 410. $9.75.)

Anyone likely to read this review is probably familiar with the wider professional context of the book, such as Myres McDougal's other writings, the policy-oriented jurisprudence at Yale, and the fact that now, in the late 1960's, is the first time in the history of international law that governments are trying to lay down a world-wide set of rules for the making of treaties and for the handling of treaty-related problems. In 1966, the U.N. International Law Commission completed many years of work on the law of treaties and adopted a set of 75 Draft Articles (ILC Draft), submitting it to the U.N. General Assembly and thereby to all Member States. The ILC Draft impulsed a world-wide professional debate in governments, law schools, political science departments and relevant learned societies. The U.N. General Assembly convened a

Conference on the Law of Treaties to consider the ILC Draft. The first session of the Conference was held under U.N. auspices in Vienna in 1968. More than 100 States were represented by plenipotentiaries. The second and final session is scheduled there for 1969. The first-named author of the book, Myres McDougal, was a member of the United States Delegation to the 1968 Conference. He had previously served on the special study group on the law of treaties appointed by the American Society of International Law to feed academic opinion into the process by which the State Department formulated American policy toward the ILC Draft. And aside from its perfect timing in this whole context, the book also happens to be the first major monograph on treaty interpretation published in English since World War II. So, obviously, the setting could hardly be more appropriate.

For all these reasons, the book is a must for the specialist in international law, and it will stimulate professional thinking in several adjacent fields. It is an ambitious book, as the title correctly suggests. It aims far beyond the immediate prompting of the ILC Draft. It starts from scratch in asking what men mean when they say or think they "agree" on something. The search goes into fields as far apart from traditional legal research as neuro-psysiology, linguistics, semantics, non-verbal communication, game theory, symbolic logic and others. The book designs its own system of inquiry and defines its own terminology. It also covers relevant legal sources from the classic authors of the 17th and 18th centuries to the latest court decisions. Conclusions and policy recommendations tie in nicely with McDougal's general and well-known concept of "minimum world public order." In this context, minimum world public order calls for a system of interpretation that aims at finding what the book calls the "genuine shared expectations" of the parties to a given agreement. How should the interpreter find the genuine shared expectations? According to the book, no single source should be taken as exclusively authoritative, not even the treaty text itself. The text is important, certainly, but so are the preparatory work, ancillary negotiations, subsequent practice, and the whole legal-political ambience before, during and after the merging of two or more national policies in one legal instrument.

Certainly, it would be a better world if governments and courts were to interpret treaties by the rules which the book suggests. Cheating would be harder. Ambiguities would be rarer. International transactions would be more predictable. Global purposes would enter and pervade the system. But how do we get from here to there? Which is the cart and which is the horse? Is there not a threshold yet to cross *before* interpretation can do these things?

Most of us who are writing about international law face the threshold problem in one form or another. We want to look toward a better future and even move things in this direction, but we also want to remain relevant to the ugly present. Each of us mixes the dosages as best he can at any one time for any one topic. This book, in my view, assumes too much when it offers technical advice to States in how to get at the "genuine shared expectations" or the "real meaning" of treaties. Such advice necessarily assumes that States want the real meaning to appear. But what if they don't? What, in fact, if this is what States try to avoid just because they know there is political power in interpretation, and because this power increases with the obscurity of the meaning?

This should not belittle the importance of interpretation in general or the book in particular. Quite to the contrary. It would not belittle Chief Justice Marshall to remember that the United States Constitution came first and his interpretation came second. He, in turn, reminded his audience that it was a "constitution that we are expounding." But when we are thinking about world public order in the mid-20th century we should remember that it is *not* a constitution that we are expounding. Unlike the U.S. Constitution, world public order is an academic abstraction. As such it is useful. It helps us think. It is elegant. It satisfies a need for professional shorthand. We don't have to go through cumbersome qualifications in writing about the better world toward which international law points. But in all this we must beware of reification. Terms like "world public order" and "constitutive processes" may, through repetition, acquire a misleading semblance of reality. Of course, this was not the authors' intention. They themselves are aware of this danger, and say so (page 395):

> "We are under no illusion, of course, that establishment of appropriate goals for interpretation . . . will necessarily bring about the realization of a world public order of human dignity."

And yet the book as a whole leaves a much more optimistic impression. It is almost as if the authors were only paying occasional tribute to this aspect of reality, such as in the above quotation, but were otherwise satisfied with some assumptions about State behavior, especially the one that States really want to maximize predictability of treaty performance and hence stability of the international system.

The harsh fact of the matter, as I see it, is that predictability is only one side of the seesaw. The other side may be called flexibility. States want predictability for others, and flexibility for themselves. In my view, this have-and-eat-cake spirit pervades international law. Therein lies its central paradox, and its timeless fascination. It manifests itself wherever we probe deeply enough into the logic of international legal rules, for instance here in treaty interpretation. State practice shows this ambivalence. Predictability and flexibility are both desired, and yet mutually exclusive. As the one goes up, the other must go down. Therefore, there is no technical solution. The real question is political: how much predictability *at the expense* of how much flexibility? States do not ask how to maximize one, but how to optimize the mixture of both.

We are back at the cart-and-horse problem. States must first be willing to move toward greater predictability, and thereby to change the international system itself. Then (but only then) will the time have come for the experts to suggest instruments to move the State system from here to there, and thereby to change it. Many instruments are possible, and some may be better than others, but unless States are *willing to use* the instruments, it makes little difference how good any given instrument may be.

The book fails to face this basic problem squarely. Instead it tries to solve the problem by assuming it out of existence. The last paragraph of the book begins with this sentence:

> "Proper principles of interpretation, therefore, are indispensable instrumentalities of change in the direction of a more perfect public order."

This eventual reification of what started out as nothing but an assumption is, in my view, the major shortcoming of this otherwise excellent book.

Whether or not one agrees with the central thesis of the book, there is no question that it constitutes a major contribution to the current world-wide discussion on the law of treaties. There is virtually unlimited food for thought (and stimulation for further research) in the very sweep of its design and in the radical questions it raises about the act of agreeing and about the fact of agreement. Without any doubt, our profession has been enriched and our thinking has been invigorated by this book.

Little Groups of Neighbors: The Selective Service System. By JAMES W. DAVIS, JR. AND KENNETH M. DOLBEARE. (Chicago: Markham Publishing Co., 1968. Pp. 276.)

Selective Service: Conflict and Compromise. By HARRY A. MARMION. (New York: John Wiley & Sons, Inc., 1968. Pp. 168.)

Despite a strong similarity in concluding recommendations, and presentation of some of the same government data, these two books represent a thoroughgoing contrast in approaching Selective Service policy.

The ultimate concern of Davis and Dolbeare is to display the potential of policy analysis for both value choices and empirical theory; their orientation is self-consciously professional. Selective Service thus becomes the vehicle for a variety of theoretical expeditions on several levels of analysis; and the vehicle is fueled by an equal variety of data-gathering techniques. Marmion, an executive of the American Council on Education, follows the issue-oriented approach to political choice: "My intention is to convey the excitement surrounding the draft debate [of 1967] as well as some of the frustration that results when one realizes that well-thought-out reforms are not being accepted." (p. x) Marmion's data are derived from previous writings on the subject and observation of Congressional hearings and debates. From almost any point of view, the contributions of the Davis and Dolbeare study are far greater.

Little Groups of Neighbors, at the simpler levels of analysis, deals with the questions of organization, variability in impact and individual attitudes raised publicly in regard to draft policy. In the process, the study effectively challenges both the system's characterization of itself as "little groups of neighbors" and its assertion that draft support rests on widespread support for decision-making by local boards. The data are tied together to form a different picture, in which deferment policy and organizational characteristics mesh to provide lowered military liability for those in higher socioeconomic strata "while conferring the management of deferments and inductions upon community influentials drawn from the same strata. . . . Small wonder that they then are willing to tolerate if not affirmatively support . . . [the system's] continuation." (p. 4)

The accumulated data then serve as a base from which Davis and Dolbeare embark on three separate quests for practical and theoretical significance. The first of these is an attempt to make draft policy recommendations in a professional capacity. The procedure involves, first, estimating future consequences of alternative policies in light of findings about the present system, and second, choosing among projected consequences on the basis of the nominal values of current policy—efficiency, equity and public support.

Second, the authors examine the Selective Service experience for gains in understanding conflict and convergence between citizen participation goals and organizational goals. Although concluding that conscription is an area in which the two sets of goals cannot be attained simultaneously, they offer a speculative set of conditions which might promote such convergence in some other areas.

Finally, Selective Service is placed in the descriptive context of the Eastonian "feedback loop" in order to estimate extent of support, feedback and possible change within the system. From this descriptive transfer Davis and Dolbeare derive a few tentative hypotheses relevant to systems theory itself.

All in all, *Little Groups of Neighbors* is an ambitious undertaking marked by a reasonably high level of success. In relation to their policy recommendation aim, the authors have done well in narrowing the available alternatives, and for the most part have resisted the temptation to overrun their data limitations in projecting policy consequences. The point on which their projections are most hesitant—public support—is also the one most open to question. If, as seems to be the case in *The American Soldier* studies, perceptions of unfairness are correlated with perceptions of deprivation relative to the experience *of one's friends and associates,* rather than to those of the whole population, draft randomization might actually increase bitterness among draftees and their families. In short, even high draft liability, if shared with most of one's friends, might be more tolerable than a random fate.

Any discussion of public support must also take into account distributions at different levels of political activity, as the authors themselves well realize. The problem is that values may also vary by these levels; and view of the draft among national policy-makers may be determined largely by values related not to efficiency, equity or general support, but to the costs of change for possible tradeoffs on other policies. Davis and Dolbeare recognize this in brief examples; there is also implicit recognition in their suggestion that goal attainment and adaptation to change may not be as central a motivation as systems theorists have thought. But the recognition does not eliminate the difficulties involved in choosing only three values upon which to base policy decisions.

The chapters presenting the researchers' search for theory in relation to participation and feedback are laudable both in content and in willingness to venture beyond the last table of cross-tabulations. In fact, the book as a whole stands as a splendid example of the inductive steps to theoretical development. At the same time, it demonstrates the limits of this process; for the last chapters, though theoretically the most significant, are also very brief. Davis and Dolbeare sought to display the *potential* of policy analysis for theory, and have done so admirably. Full development, however, depends equally on deductive reasoning, and that is not provided in *Little Groups of Neighbors.*

Without wishing to seem unduly critical of a highly instructive work, I would add a methodological note. A certain amount of naivete in data handling appears in several places in the work; for example, no measures of association are used, even in the case in which a scattergram is presented. Such omissions constitute a minor annoyance, but in one case failure to calculate percentages for a controlled variable from the correct base changes the results. The table is used to show that approval of local boards is a function of education; properly calculated, it makes clear that approval is instead a function of knowledge about the boards, consistent across all educational levels. In view of the positive relationship between such knowledge and occupational status, it may well be that the effect of occupation would wash out also. Either by itself or in conjunction with a knowledge-occupation check, the discovery requires some re-evaluation of contentions regarding the draft and local elites.

Marmion's study of the Selective Service has much less to recommend it; indeed, it illustrates perfectly why policy studies fell into disfavor among political scientists. It is composed of a short history of the draft; a critique of the present system; a series of arguments against alternatives to conscription, and an account of the passage of the 1967 Selective Service Act.

The Marmion study is rather less persuasive than that of Davis and Dolbeare from the point of view of policy recommendations; and it has no theoretical perspective beyond advocacy. Potentially, it could have pointed up the alternative values of policy-makers mentioned as a problem in *Little Groups of Neighbors;* or it could have provided additional understanding of legislative processes. In fact, it does neither. Nominally a study of conflict and compromise, it tells us very little about these vital political concepts. Mr. Marmion has produced a highly readable book, and an honest (if somewhat overheated) appraisal of draft policy alternatives. But it is not a work which will be of great interest to most political scientists.

KATHERINE A. HINCKLEY

Rice University

Economic Policy-Making and Development in Brazil, 1947–1964. By NATHANIEL H. LEFF. (New York: John Wiley and Sons, 1968. Pp. 201. $7.95.)

Professor Leff has written a provocative, original and important study of Brazilian political and economic development. One of the central problems to which he addresses himself is: what do case studies of major economic policy decisions reveal about interest aggregation patterns?

Much of the literature on Brazilian development has argued that the President is unable to implement a coherent development policy because he is both pressured into yielding to a high level of demands and is checked by powerful veto groups. Leff argues, however, that the President has a substantial degree of freedom and that private-sector interest groups, whether domestic or foreign, did not in fact strongly influence the formulation of government economic policy. To support this thesis he offers a series of case studies of economic policy-making based on open-ended and anonymous interviews with former cabinet ministers, government experts (the técnicos), and representatives of interest groups that participated in the policy-making process.

In the case of the major export sector, the coffee planters, Leff argues that this interest group, traditionally assumed to have substantial political power, consistently failed to obtain their major policy goals in the period under examination. He demonstrates that they were unable to block the steady increase in the export taxation rate, which rose from 23% to 55% of the total value of coffee exports between 1954 and 1962. Similarly, demands by coffee interests that the protective tariffs for industrialists be kept low and that the dollar-cruzeiro exchange rate be undervalued were equally ineffective.

Leff similarly shows that despite the hypothesis that rapid industrialization has resulted in new political powers for the private-sector industrial interest groups, the public-sector's share of all Brazilian long-term investments actually doubled between the 1947–1949 period and 1958–1960. Even the Development Bank, originally set up as a major source of long-term financing for private industry, gave 84% of its total allocations to public-sector projects between 1952 and 1964.

From these and similar studies, Leff argues that not only has the power of interest groups been overestimated, but that the interest group approach to political analysis imparts a serious perceptual bias in a system where actors from the same "interest group" directly compete for preferential treatment and personal favors at the level of policy implementation, rather than aggregate their demands at the level of policy formulation.

Whereas most commentators have viewed this "clientelistic" style of politics as developmentally dysfunctional, Leff claims that the very weakness of interest groups has the functional effect of allowing the President and his expert advisors a "substantial degree of autonomy" to determine policy according to technical and national considerations. This reviewer would add, however, that the presence of strong interest group demands can also be a source of political *support* for governmental programs, and the absence of such demands a source of Presidential weakness rather than power. For example, largely because of their "clientelistic" nature, the peasant leagues and the trade unions were not able to effectively aggregate their demands and mobilize the support that President Goulart needed to make Congress accept his program of "Basic Reforms."

This reviewer also feels that the image of the "autonomy" of the President would have been further reduced if more consideration had been given to other sources of constraints on the President besides the relatively formal interest groups of the private-sector. For example, the limits imposed on the President by the decentralized public-sector agencies and large government corporations, owing to their high degree of revenue and budgeting independence, and their tradition of bureaucratic entrepreneurship and pressure group activities, needs more research. The fact that Populist Presidents felt that they had to avoid antagonizing mass opinion, not merely elite opinion or interest groups, was also an important factor in the rapid softening of initially firm stabilization policy-decisions to freeze wages or to eliminate subsidies of wheat and bus fares.

Given Leff's position that the Presidents in the period between 1955–1964 did not experience significant political obstacles to effective economic policy-making, what is his analysis of the constraints on the economy that reduced the very high growth rate of the 1950's to near stagnation by 1963–1964? This is another major theme of the book. While not disputing the fact that the growing political polarization and the constitutional crises contributed to inflation and to the 1964 coup, which installed the first military government in the twentieth century in Brazil, Leff argues that the basic cause of the economic slowdown was a constraint on imports due to export stagnation. Between 1948 and 1962, the volume of Brazilian exports increased by only 7%. Prices fell even more sharply, however, so that foreign exchange earnings actually

declined. Thus while the GNP rose by 61% between 1954 and 1963, the capacity to import did not increase at all. Since Brazil's rapid industrial growth rate was largely the consequence of an import substitution process that was more import intensive in terms of raw materials and equipment than was realized at the time, Brazil's low capacity to import finally checked further development.

A common theme of development politics is the desire of developing countries to escape dependent or colonial economic status by creating modern industrial and service sectors. Less well documented, however, is the often unconscious hostility that exists towards the agricultural sector and specifically to traditional exports, which are seen as symbolic of dependent status. This hostility towards developing traditional areas of the economy frequently leads to serious underinvestment in and underutilization of resources that could help finance the desired diversification of the economy. In Argentina, for example, Díaz-Alejandro has shown that only 1% of the net increase in capital formation between 1927 and 1955 took place in the agricultural sector, and that this contributed to the 26% decline in the total quantum of exports between the 1925–1929 period and that of 1957–1961.

One of the strengths of Leff's book is his interesting discussion of the psychological and ideological origins of the export stagnation in Brazil and the bottleneck in foreign exchange that resulted from it.

On the basis of his own extensive interviews, Leff concludes that the Brazilian economic administrators had a "strong bias against exportation, either as a source of aggregate growth or as a means of dealing with the country's balance-of-payment problems." Part of this bias stemmed from their "exportable surplus" theory of trade which viewed exports as desirable only if the domestic market was completely supplied. Disregarding comparative advantage trade considerations, the exchange rate for exports was overvalued and export licenses were often denied. Another subjective consideration involved was the fear that expansion of exports would increase dependency on world trade and perpetuate an agrarian economy in Brazil. Leff argues convincingly that given the relatively high elasticity of supply, Brazil could have satisfied domestic demand while simultaneously expanding exports and then using the exchange earnings to help finance industrialization.

Leff also has valuable discussions of the causes of the infiuence of "técnicos" in the system, the Brazilian process of opinion formation, and the informational requirements of effective policy-making. In all, Leff has probed some of the more difficult and central questions about the Brazilian political and economic system. Despite some differences of opinion, this reviewer feels that more than any other recent book on Brazil, Leff has opened up new areas for research and forced a re-evaluation of some basic hypotheses.

ALFRED STEPAN
The RAND Corporation

The Third Reich of Dreams. With an Essay by Bruno Bettleheim. By CHARLOTTE BERADT. (Chicago: University of Chicago Press, 1968. Pp. 177. $4.95.)

This book deals with a crucial aspect of political life that has been too often ignored in political science—the intra-psychic mechanisms whereby individuals collaborate in their own control by a totalitarian regime. Analyzing the dreams of over 300 Germans who lived in Nazi Germany, Charlotte Beradt (a journalist and collector of these dreams between 1933 and 1939) shows how many individuals unconsciously made the regime more systematic in its terrorization than it actually had been. The dreams show how, "in their blind fear of the hunter, such people would assume his role and hunt themselves—how they inadvertently helped set and spring the traps into which they were meant to fall." (p. 50)

Beradt organizes her presentation of these dreams around their central themes. There was, for example, a widespread apprehension that nothing could be hidden from the government Thus one dreamer heard a loudspeaker blaring out a decree on the "Abolition of Walls"; another was detected in a thought associating Hitler with the devil by an electronic machine; others dreamt of Dutch ovens, mirrors and the like which recorded their private conversations or innermost thought for the benefit of the police. The dreams—replete with items such as a "Monitoring Office," or a "Regulation Prohibiting Residual Bourgeois Tendencies Among Municipal Employees," and "nose-suspects"—also showed a general anticipation of the bureaucratization of terror and the fear that one might become a suspect. Most significant was the inability of the dreamer to rebel, even in his sleep. One dreamer, e.g., carried out a contemplated letter of protest by putting a blank sheet of paper in an envelope; another faulted in the telling of a forbidden joke; one man dreamt in triangles, rectangles, and octagons, telling himself that it was forbidden to dream. Other dreamers were admired or sought after by Hitler, Goering, or Goebbels. Even among the

Jews—most of whom tried to cross borders or sail ships in their dreams—there were a few who tried to join in with the regime: e.g., one man dreamt that Hitler intervened on his behalf against the slurs of a lower official, saying, "Our Jews are not like that." Only one person in this entire group ever dared dream of an attempt on Hitler's life, and he was outside Germany at the time of the dream.

In seeing these dreams as specific adaptations to twentieth century totalitarianism and the Nazi regime in particular, Beradt needlessly limits their usefulness. As Bruno Bettleheim points out in an excellent essay accompanying this edition of the book (which was first published in Germany in 1966), the totalitarian regime does not mold a new human nature—rather it plays upon and exploits common psychic weaknesses. Arrogating to itself the paternal position, the dictatorial regime drives the subject back, unconsciously, to a state which all have known—the helplessness of infancy. Governmental authority then takes on for the subject individual the omnipotence, the omniscience of the original authority; and insofar as this authority thereby becomes inescapable, the boundaries between self and other are erased and the identity threatened. The result is a splintering of the ego.

In treating the regressive possibilities apparent in these dreams as a potential for all human beings under certain circumstances, Bettleheim gives Beradt's work a utility for the whole of political science that it would not otherwise have. Viewed in this light, the material gives support, e.g., to Lasswell's argument (in A. H. Stanton and S. E. Perry, *Personality and Political Crisis,* 1951) that governmental lies and other acts that undermine faith in the public authority and information sources may not result in a growing criticism of the government; rather, it is apt to lead to a widespread atrophy of the ego among the populace and the development of a public life which is characterized by the cue and the ratlike response, a clinging to the threatening but all-powerful authority.

If one were to employ the ordinary criteria for assessing the techniques of inquiry and validation used in this work, the author could be criticized on several counts. The choice of individuals for study was not systematic—Beradt (with the assistance of some friends, including one physician) simply interviewed those with whom she came into routine contact. Background characteristics were in no way controlled: she talked to her dressmaker, her aunt, the milkman, as they were available to her. Her sample was not representative of the German population: "yes men" and individuals who directly benefited from the regime were not interviewed. Nor was the authenticity of the dreams guaranteed through tapes or signed statements by their originators. (The dreams were recorded by Beradt, using code words for key items such as "Hitler" and "Party," then hidden in book bindings, and ultimately mailed out as letters to her friends throughout the world.)

Yet neither the subject matter nor the times would have permitted Beradt the usual research techniques. She had the courage and the intelligence to inquire into an extreme political situation in which she had been caught and her material seems to have been collected with as much imagination and care as was possible under the circumstances. To hold her to the usual standards of research would be to unduly restrict investigation in political science. It is in just these most difficult cases (methodologically speaking) of social crisis or political aberration that some of the most interesting political material becomes available. In varying the former "givens" of a political system, these circumstances make possible the investigation of the parameters of ordinary political life.

Two methodological criticisms can nevertheless be made. A more systematic presentation of the data she does have would make it possible for the reader to assess her interpretations of her data. Furthermore, a review of current research on dream interpretation and content (e.g., the works of E. Erickson, D. R. Hawkins, M. Ullman, K. Altshuler, P. Giovacchini) would have been useful. As it is, her decision to deal exclusively with the manifest content of dreams, and to treat them as relatively clear statements of current conflicts with the regime, while at the same time prophetic, raises some serious questions. As Bettleheim points out, the dreamer's insight into the inner nature of the totalitarian regime can only be explained in terms of certain tendencies present in him, tendencies due to unresolved conflicts arising out of his own experiences in infancy. Beradt's dreamers were torn, because of their own inner motivations, between affirming and denying Hitler's regime.

Despite these problems, this work provides some very significant data for the political scientist. When compared with other available studies on the dreams of resistance fighters (a few of which are given here) and those imprisoned in concentration camps (e.g., as reported by L. Bandura in 1948), further insight may be developed into those very central and too often ignored unconscious processes which tie rulers to ruled in a variety of political circumstances.

Political Ideology in Malaysia: Reality and the

Beliefs of an Elite. By JAMES E. SCOTT. (New Haven, Yale University Press, 1968. Pp. 302. $8.75.)

Sociopolitical transition has provided the principal matrix for analyzing the formation of political beliefs in new nations. The book under review suggests that we should be giving more attention to the impact of economic growth.

Scott is concerned with how existential factors shape top officials' perceptions of nature, man and, peripherally, the political arena. "Ideology" here conforms to Robert Lane's notion of an overall pattern of beliefs held by an individual, a pattern usually more observable to the interviewer than to the respondent himself. To pursue the Malaysian ideologies Scott adopted Lane's technique of in-depth interviews, open-ended questioning, and a relatively small sample. During 1965–66 Scott held long interviews with seventeen top ranking civil servants holding positions of considerable responsibility in the Malaysian Federal Government. He supplemented this small sample with written questionnaires submitted to a larger group of civil servants.

Formal ideology, public and politicized, may or may not coincide with an individual's personal and perhaps latent ideology. The degree of coincidence between the two is Lane's central concern in *Political Ideology* (1962). Scott is less concerned with the "fit" between public and private ideologies in Malaysia. Malaysian political leaders themselves have always taken pride in their pragmatic eschewance of ideological enthusiasm, though in practice they have adopted many liberal democratic forms and procedures. Instead, Scott concentrates on the degree to which his respondents fit an abstract concept of democratic ideology, one which is considerably broader and more coherent than any Malaysian public orthodoxy. The book sidesteps the analytical trap into which so many western observers have fallen: measuring a society's political well-being in terms of its consensus on democratic norms. In fact, one of Scott's chief propositions is that deviation from democratic beliefs—which is common among these Malaysian officials—is not, *a priori,* evidence of systemic disfunctionality. Quite the contrary. In Malaysia or in any country which is economically poor, socially heterogeneous, and in the throes of unprecedented change such departures from democratic beliefs may be evidence of perceptual *realism,* a requisite for effective decision-making. On the other hand, despite Scott's obvious sensitivity to the pitfalls of western parochialism, structuring the analysis around a democratic scale in itself undermines his own intent. The seventeen civil servants do not come off as pathological, but they remain deviants nonetheless.

This book is less about Malaysia than about the process of belief formation. Scott singles out Edward Banfield's *The Moral Basis of a Backward Society* (1958) and Lucien Pye's *Politics, Personality and Nation Building* (1962) as alternative explanations of this process. Between Pye's essentially psychoanalytic thesis of identity crisis and Banfield's environmental thesis of a poverty culture, he finds Banfield's more valid and useful and, one might venture, more optimistic. While Malaysian officals are plagued by the conflicts so characteristic of societies undergoing accelerated social mobilization, their expression of fatalism and social distrust are not fully explained by identity crisis and its accompanying "ego weakness." Their conviction that the world is relatively immutable and that the ordinary man is driven by a Hobbesian self-interest also derives from their acute awareness of the external conditions. Thus their fatalism and social distrust is witness to their realism, not simply to their internal instability.

The external realities having the most profound impact of the respondents' perceptions and expectations—and dampening their enthusiasm for democratic politics—are 1) the peasant social base which, in the midst of urbanization and modernization, remains the core of contemporary Malaysian society, 2) the ethnic communalism which generates violence and mutual suspicion, and 3) the scarcity of material and capital resources necessary for growth. Of these three factors, Scott assigns greatest weight to the latter.

The basic belief shared by these ethnically diverse (Malay, Chinese, and Indian), British-trained, English-speaking, urbanized bureaucrats is that rewards are relatively fixed in quantity; consequently, men must compete for larger slices of what is, in Scott's words, a "constant pie." It is this seemingly inescapable scarcity which generates men's selfishness and warrants cynicism toward public spiritedness and preference for paternal authority.

Scarcity and the "constant pie" syndrome are salient in newly independent nations and in older but similarly poor nations (or parts of them) as well. The existential repressants of democratic beliefs should be as common to Banfield's Italian village and Oscar Lewis's Spanish Harlem as to Scott's Malaysia. Scott's hypothesis, then, has relevance for more than just the post-colonial societies. There is a real need for comparative analysis which bridges the new nation-old nation dichotomy, and Scott makes a contribution in his direction.

In a country study one is always torn be-

tween detail and generality. Excessive attention to national peculiarities limits its theoretical utility, while concentration on general traits shared with other countries risks glossing over variables which should be taken into account in subsequent comparative analysis. Despite Scott's Malaysian expertise, he pitches his study at so general a level as to leave certain important questions unanswered. For instance, what is the precise nature of scarcity in Malaysia? Even affluent societies have been unable to escape guns-versus-butter debates. Decision-makers' sensitivity to the restrictions of scarcity, in fact, may increase as development proceeds. And a second question: how has the Malaysian bureaucracy related these civil servants to the nation's poverty or scarcity? Scott discusses the ideological consequences of the respondents' British training, but he might have gone further in investigating the impact of the decision-making role itself on the bureaucrats' beliefs, particularly in light of the Malaysian government's emphasis on economic growth. One would expect officials under the Alliance regime to differ from ordinary peasants and from bureaucrats in less growth-oriented governments in their attitudes toward the expandibility of resources.

Scott's exploration into the interplay between beliefs regarding scarcity and growth suggests that we should be giving more attention to personal time perspectives as a variable in ideological formation, since skepticism or optimism about the expandability of resources hinges so largely on whether an individual has a short-range or long-range frame of reference. Scott posits the Pye and Banfield approaches as principal options in analyzing ideology in underdeveloped socieities. But a focus on the implications of personal time references may bring the psychoanalytical and environmental explanations much closer together.

The Eclipse of Citizenship: Power and Participation in Contemporary Politics. By ROBERT J. PRANGER. (New York: Holt, Rinehart and Winston, Inc., 1968. Pp. 110. $2.95.)

Action, Symbolism, and Order: The Existential Dimensions of Politics in Modern Citizenship. By ROBERT J. PRANGER. (Nashville: The Vanderbilt University Press, 1968. Pp. 225. $6.95.)

The first of these books is a clear, brief summary treatment of a large, important, and neglected subject, the philosophic theory of "democratic" citizenship. In that light, what the book gives us will be gratefully received. However, it is as inevitable that its shortcomings will be openly regretted.

The second of these two books, which treats mainly the fundamental defense of active citizenship in philosophic and/or psychological terms, goes far towards filling a gap left by the first but in ways so specialized as to be of probable interest only to some readers.

The first book steps off from a distinction between "the participation of citizens as an enterprise with values and distinctive forms of action" and, on the other hand, "the more ordinary struggle for power and authority usually associated with politics." (p. vii) This distinction becomes the basis for the book's two main, explicit arguments, the definition and description of "participatory" politics as a viable ideal and the definition and description of "power" politics, especially as revealed in the traditional "representative" democracies of Britain and America. The thesis is that the traditional representative democracy never did, and in recent decades, has increasingly failed to provide meaningful opportunities for "much spontaneous civic experience."

> The participatory spaces between authority and anarchy are neglected . . . Authority is promoted, maturity stymied. The adult citizen is almost dead, and with him will vanish the human being, autonomous and social, we in the Western political tradition have come to respect. (p. 102)

Behind these explicit arguments is another, less strongly stated but more general in its implications, and it sustains the whole book. This is the book's notion of what constitutes politics, or, better, political life. Whether done well or ill, political life, in this view, is a distinctively human process in which actors share membership in patterns of interaction and through these express to and with each other the hopes and fears of their communal life. The conception is spelled out in considerable detail, covering both objective and subjective aspects, and constitutes a distinctive and almost separable feature of the book.

It is a feature, of course, which is directly related to the book's other outstanding feature, its bias in favor of what in other circles these days is loosely referred to as "participatory democracy" (a phrase Professor Pranger abjures because its second term, "democracy," has come to cover a multitude of sins some of which he wishes to condemn). The two features complement each other admirably and together they result in a sharply defined restatement of an ancient political ideal which many praise and few practice. We should be grateful to have such a forceful and clear restatement at this time and can all hope that the book which contains it will

have a wide readership among, especially, our students.

But it is still a *re*statement and it can be asked whether Professor Pranger's efforts have taken us much farther than where, for example, A. D. Lindsay left us with his *The Essentials of Democracy* published more than thirty years ago. Is "participatory politics," with its heavy methodological emphasis on politics as a process of communication, anything more than a new name for "government by discussion"?

For this reviewer, the advocacy of participatory democracy which began with T. H. Green, and came to the United States in the works of John Dewey, as Professor Pranger notes, still lacks an American prophet. To fill that role, more than restatements of the ideal are needed. In the light of that ideal, American democracy must be condemned, not cursorily, superficially, and generally, but specifically, fundamentally, and at length.

In this connection, Professor Pranger's book can be seen as suffering from a further limitation. He appears to subscribe to the view that America is a nation peculiarly free of ideology (p. 101). He also appears to subscribe to the ideal of participatory citizenship almost as an end or value unto itself. In both cases, his vision would seem to be too narrow. Our system of representative government in this country is an aspect of our national commitment to liberalism and could not and would not be otherwise sustained. To the same scale, a conception of a truly active citizenry in which, to use Professor Pranger's own phrasing, "the citizen's primary role is to create a politics, not to function as an appendage, or mere participant, for the structure of power" (p. 89), is but an aspect of a larger and more fully comprehensive political philosophy, and one of a profoundly socialistic and anti-liberal sort. Professor Pranger's opposition between "participatory" and "power" politics is thus but an aspect of a much larger collision between liberalism and socialism. The persistent failure of Americans to bring this collision at least into honest view constitutes what W. A. Williams has called our "great evasion," and Professor Pranger is no more guilty of perpetuating the fault than a host of others. But it is depressing to see the situation unrelieved, even in the face of an unusual opportunity for doing so.

The failure to extend the argument into its ideological dimensions is even more obvious in the second of Professor Pranger's volumes, but in view of what this book does do it would be unfair to harp on what it omits. What it does is to search through a vast philosophical literature, including most prominently the works of modern existentialists, for an argument for the ideal of active citizenship which can be grounded in the realities of human experience and not just in personal preference or national heritage. In its own terms, the search is wide ranging, for it attempts to enlist novelists, theologians, and philosophers into common cause with social scientists and to have all of them find a common theme which will join the vocation of citizenship to that of the whole man, that is, politics to "joy, sex, and sleep," a phrase borrowed from Lawrence Durrell.

The search is for something more than the assertion that through political activism with fellow citizens the individual can discover, both socially and psychologically, a personal fulfilment and sense of identity not otherwise available to him. It is for an absolute ground for such an assertion, however tentatively its final discovery may be expressed. But it will take a special kind of reader to wish to follow Professor Pranger through this search to the end. This is not because, or, as the case may be, in spite of the density of the argument and the frequency of the citations. It is rather because many readers will suspect from the outset that the search is self-defeating. Either we are committed to the ideals of citizenship or we are not, and to ask why, either way, is simply to push the argument, as it were, into another room. The search for the uncommitting commitment is a chimera which Professor Pranger is no more likely to pull to earth than was Sarte or Merleau-Ponty.

The Chinese World Order: Traditional China's Foreign Relations. Edited by John K. Fairbank. (Cambridge: Harvard University Press, 1968. Pp. 416. $10.00.)

There is a great deal to commend this volume to political scientists. An encyclopedia of factual statements concerning China's external behavior, *The Chinese World Order* comes close to being unrivalled for its probing case studies and scope of presentation. Historian John Fairbank and twelve of his associates and former students have summarized their researches into Chinese policies toward Korea, the Ryukyu Islands, Vietnam, Inner and Central Asia, and the West. Several essays treat the best known operational modes of Chinese foreign relations, particularly trade, the tribute system, treaty relations, and the *chi-mi* or "loose rein" form of diplomacy. Since Professor Fairbank summarizes each essay in the introduction to the volume there is no need to repeat his excellent overview of the book's contents.

In theory, China's foreign policy-makers

acted in accordance with a set of interlocking assumptions. As has been written many times before, these assumptions involved beliefs that the Chinese were naturally superior, that all outside "barbarians" were culturally inferior but differentially capable of harming China, that foreign states were ranked according to their potential threat and cultural affinity to China, and that states in each of three rankings or "zones" were considered equal among themselves by the Chinese. The three zones were a nearby Sinic or culturally Chinese zone, an Inner Asian zone where populations presented the dominant military danger to China, and an Outer zone. The Chinese world order thus revolved around China itself but was global in its extent. It was "unified and centralized in theory by the universal preeminence of the Son of Heaven," and drew on the political theory, kinship terminology and rituals used by the Chinese within their own land. According to Professor Fairbank this order has been passed on to the Nationalists and Communists and "bears upon Chinese policy thinking today."

The essays themselves thoroughly undermine the notion that one can meaningfully talk about "the Chinese world order" beyond the theoretical and psychological levels. The editor notes at the outset that this "order was a unified concept only at the Chinese end and only on the normative level, as an ideal pattern." Although one by one the authors struggle with the divergence between this ideal pattern and imperial practice, an essay by Wang Gungwu of the University of Malaya seems to cast doubt on the wisdom of continuing that struggle at all. Deceptively labelled a "background essay," Professor Wang's piece constitutes a fundamental criticism of the whole view that there was an all-embracing Chinese approach to world order from the Ming Dynasty (1368–1644) onward. If I understand his argument correctly, Wang is saying *inter alia* that there might have been such an approach prior to the Mongol conquest in the 12th Century, but that the total subjugation of the Mainland by the armies of Genghiz Khan and his successors over a hundred-year period invalidated the above-noted assumptions of Chinese world order. Then after the defeat of the Mongols and the restoration of the all-Chinese Ming Dynasty, the Emperor's historians deliberately sought to erase the century of humiliation by an even stronger assertion of the vitality of the Chinese world order. When prophecy fails, the prophets march forth.

A few of the authors in this volume, particularly Professor Benjamin Schwartz, seem to perceive how critical the points raised by Wang are. Schwartz indeed virtually dismisses the operational significance of the Chinese world order for modern times and instead discusses the important questions that arise from a Chinese perception that bears only tangentially on state practice. As Schwartz seems to recognize, this is more than a question of matching theory to practice, and cannot be understood as a problem of ends versus means. Here one gets principally into the realm of beliefs and domestic politics rather than of international behavior (although the two are obviously related). In this sense, as contributor David Farquhar suggests at one point, the Chinese world order had more to do with the internal authority of the Emperor than with matters of foreign relations. By exaggerating external issues and his own international prominence, for example, the Emperor could silence domestic critics and limit internal political conflict to his advantage. In addition Truong Buu Lam shows how recourse to the rhetoric of Chinese world order could sometimes play a significant part in the saving of face and in masking political vulnerability in diplomatic negotiations. The Chinese thus manipulated their view for the purposes of conducting a winning political strategy or making it appear to be a winning one to critics in the imperial court. In this fact-filled volume the explicit theory thus bears little relation to the rich data of foreign relations which deserve a reanalysis in comparative and systemic terms.

In his magnificently written essay, Wang Gungwu makes an additional point that seems to escape the majority of authors whose point of departure is the Chinese world order as such. He presents the best case I have seen on the importance of sorting out the many different "Chinas" that have arisen on the Mainland. China's relative power position has made a crucial difference to its policies; the leadership's ability to perceive and adjust to this position in turn has changed with varying patterns of external communications and domestic political circumstances. By fastening on the grand theme of Chinese world order, the more usual tendency in this volume is to homogenize the evidence so that the crucial distinctions for political analysis are lost. Wang's point in arguing about the Mongol conquest as a watershed is that Chinese policies must be understood in space and time and that any theory concerning Chinese political behavior must accept variation as normal rather than consider it to be a deviation from a preconceived world order.

Finally, Professor Schwartz' short essay at the end of the volume raises equally fundamental questions concerning the persistence of the Chinese world order since the collapse of the Ch'ing Dynasty in 1911. What Mr. Schwartz

says is not only that the question of world order was one of perception but also that the underpinnings of this perception were struck down with the collapse of the Empire. The apparent persistence of certain aspects of this perception, of course, can be explained as the transference of expressions and concepts dealing with traditional political attitudes to the new ideas of nationalism. But, the argument does not rest on the superficiality of historical continuity alone. The survival of bits and pieces, Schwartz argues, denies what was essential in the traditional perception: its integrated totality. The China of Chiang Kai-shek and Mao Tse-tung is different. The internal and external bases of the old order have irretrievably crumbled.

The Chinese World Order then is an important addition to a very thin field. It significantly contributes to our knowledge of the major dimensions of traditional China's external political behavior. These dimensions can now be studied more comprehensively by diplomatic historians and specialists in international politics and in much more concrete terms.

NOTES

POLITICAL THEORY, HISTORY OF POLITICAL THOUGHT, AND METHODOLOGY

Explanation in Social Science: A System Paradigm. By EUGENE J. MEEHAN. (Homewood, Ill.: The Dorsey Press, 1968. Pp. 128. $1.95.)

Constructing Social Theories. By ARTHUR L. STINCHCOMBE. (New York: Harcourt, Brace & World, Inc., 1968. Pp. 303. $3.95.)

Students of the method of science conventionally have asserted a distinction between what is called the context of scientific discovery and the context of scientific justification. Briefly put, it is held that methodology is concerned to explicate the logic of explanation and certain related epistemological problems. Where those explanations come from (how they are "thought up") is a problem for empirical investigation, and in principle does not bear upon methodological issues. Both Meehan and Stinchcombe seem to be arguing that philosophers of science have, perhaps unwittingly, misled practicing social scientists. We have accepted unrealistic criteria for being "scientific"; the business of doing science is not what philosophers of science seem to imply that it is.

Meehan argues that the "deductive paradigm" of explanation "currently accepted by most philosophers of science" is the villain. In Meehan's view, control is the central purpose of scientific explanation; therefore, we should consider any explanation a good one if it facilitates the desired control (he does not, of course, argue that all attempts to control are "good"). Meehan characterizes the deductive paradigm as follows: "An event is explained when it can be related to an established 'empirical generalization' or 'general law' according to the canons of formal logic. . . ." (p. 9) Such a paradigm is unduly restrictive and, indeed, impossible to achieve since "no proposition can be both empirical and general." Moreover, we cannot get out of the difficulty by concentrating on the confirmation of empirical generalizations "as Karl R. Popper and others suggest. No amount of empirical testing could possibly establish a general proposition. . . ." (p. 11) Meehan spends a little more time demonstrating that induction cannot justify a universal generalization and, therefore, that deduction from such generalizations is unwarranted. It makes little difference what Meehan says about that, though, since he is only constructing a straw man. Karl Popper—the very man Meehan singles out to attack—is most famous for his consistent argument that the only thing scientists can do is *reject* (disconfirm) generalizations; I cannot imagine how Meehan managed to read into Popper the contrary view.

What really puzzles me, however, is Meehan's alternative paradigm. He says that what we need for explanation is (1) a formal system (a calculus) which (2) is "loaded" with a given set of empirical terms (concepts) such that (3) the phenomenon to be explained appears as a formal entailment. Now, if Meehan thinks he has found an alternative paradigm of scientific explanation, he is flatly wrong. That just *is* the deductive paradigm, whatever he chooses to call it. If, on the other hand, Meehan thinks he is suggesting a new strategy for discovery, he is wrong again. May Brodbeck, in her widely reprinted article, "Models, Meaning, and Theories," speaks at some length to such a strategy. To provide empirical interpretation for the axioms of some formal calculus is not quite the piece of cake that Meehan seems to think, but it is being attempted all of the time, and it has long since been suggested to methodologists who have done their homework. In short, Meehan attacks the deductive paradigm with arguments from the context of discovery; he

fails to say anything very useful about scientific discovery itself.

Stinchocombe's book is all about scientific discovery. He is attempting to teach the reader strategies conductive to constructing explanations. Why should we believe that he knows how to construct explanations—that his strategies are any good? Well, Stinchombe gives us several kinds of reasons. First, he spends quite a lot of time assuring us that he is great buddies with all sorts of brilliant theory-builders (e.g., Coleman and Duncan). Second, many of us are not at Berkeley, and we know that, so naturally we will accept any direct-from-Berkeley knowledge Stinchcombe cares to dispense (". . . I evidently learned a good deal that was new to people not at Berkeley" [p. vii]). Third, he promises pretty spectacular results: "One way of describing this chapter is that in it we will try to teach everyone to write such books [as Union Democracy]." (p. 58) After that, I wish I could pan the book; actually, however, I think it is very good. It may indeed inspire some—if not "every"—one to write a book like *Union Democracy*.

If I read him correctly, the heart of Stinchcombe's strategy is in learning to conceptualize causally. To a methodologist, the results occasionally are shocking (". . . every concept must be . . . a *hypothesis* that specified phenomena . . . are causally operative;" [p. 40] ". . . variables may be measured either by their *causes* or by their effects;" etc.). But this is not a methodology book; it is a book about the construction of social theories. Stinchcombe adopts an intuitively appealing definition of cause (it may be methodologically unsound, but I believe that it corresponds fairly closely to the way most of us *think* about things), and restates all sorts of theoretical frameworks (e.g., structural-functionalism) in his causal terminology. He does not put great emphasis upon the need for operationalizing concepts (although it is clear that he means for concepts to refer to the world of experience), but he puts great stress upon the notion that concept formation starts with ideas about causal connections. Methodologists will recognize this as a strategy for assuring theoretical significance in scientific concepts.

After preliminary work of this sort, Stinchcombe takes the reader through stages of theory-construction. In a chapter appendix he treats linear directed graphs as a particularly appropriate technique for causal analysis (he doesn't say much about partialling techniques, etc.); other chapters deal with demographic variables, the conceptualization of power, environmental effects and activity-structure concepts. The examples are laregly sociological, but so, for that matter, is much political science specialized sociology.

Although the methodologically unsophisticated reader may not notice it at first, Meehan has written a bad book; although it may offend good methodologists, Stinchcombe has written an excellent book. Neither author, however, has eased my growing concern that the social sciences are in a state of crisis. With the advent of the scientific method, a world-view has insinuated itself upon us. To be sure, science implies control. All around us, social systems small and large convulse from overdoes of control, but I suppose I shouldn't worry. Stinchcombe is going to go back to the concrete and particular, "to try to wrestle it into sufficiently general form that it can be conveyed economically to our colleagues and descendants." (p. 293)—RODERICK BELL, *The University of Texas at Austin.*

Political Dialogues. By MAURICE CRANSTON. (New York: Basic Books Inc., 1968. Pp. 192. $5.95.)

Readers of political theory whose eyes tire easily following graph lines can find relief in the comforting prose of a new book by Maurice Cranston, Senior Lecturer in Political Science at the London School of Economics. Cranston is a representative of that vanishing species of political theorists which makes philosophy its sister discipline with no apologies and barely a courtesy to sociology. But of all Cranston has a felicitous way with words and a fine sense of style. Both in ideological position and style he suggests the best of A. D. Lindsay or Ernest Barker.

Using the format of imaginary dialogues, Cranston has contrived conversations between pairs of political philosophers ranging from Savonarola and Machiavelli on the State to Maine and Arnold on Democracy. Among the eight dialogues, Locke and Shaftesbury differ mildly over Tolerance, Diderot and Rousseau divide on Progress, Burke and Paine square off on Revolution, Marx and Bakunin fume over Anarchism, and Mill and Stephen coo about Liberty. Voltaire and Hume also have a session with Morality which meanders over too many subjects and proves to be the least satisfying of the dialogues.

It is easy to understand why writers shy away from the dialogue form. First of all there is going to be that inevitable comparison with Plato. Then there is the charge of presumption at orchestrating conversations which never took place. Also there is the necessity for a near complete command of the known writings of the subjects. What if a conversational coup with dialogue can be undone by an overlooked or unknown piece of writing? And there will always be the charge that the composer of the dialogues is being outrageously selective in his use of materials.

It is to Professor Cranston's glory that he has survived these objections. He had the boldness to use the Platonic format and not merely to be

awed by it. Rather it is the reader who is awed by Cranston's impressive command of his materials. The conversations are based on the actual words of the discussants. In some instances unpublished letters and notebooks are used as sources. This puts the critic at some disadvantage, especially one who is expecting to find a string of the familiar quotations fondly remembered from the History of Political Thought or frequently found embellishing Container Corporation of America ads.

Sometimes the arguments or anecdotes used are so unfamiliar to even a well schooled eye that a reader may wonder just how much of this is being fabricated. I hasten to add that Professor Cranston has my full trust on this score. The honesty of his scholarship is not in question. However, to readers who are so used to diving down to footnoted confirmation of every fact or argument, it may come as a shock to preceed from one beautifully phrased comment to another without the usual security of citation. Perhaps this is the supreme act of trust required by the dialogue form. You have to be certain that the subject did say what is attributed to him, especially when you find your favorite character voicing the unexpected or the unfamiliar. This can make a reader extremely uneasy about the whole idea of contrived dialogues. Unless you enjoy the pastime of literary detective, it can be very disconcerting.

Once this initial act of faith in scholastic accuracy is established, the dialogue can become a very refreshing medium for airing propositions. Cranston has certainly mastered the medium. His selected materials are smoothly woven together. Even if some of the material is new, it all sounds very plausible. Within the brief confines of these dialogues and with a minimal biographical sketch, the personality of the philosophers emerges with remarkable few strokes of argument. This is a fine tribute to the pertinency and quality of the remarks chosen. So little says so much. Even when the disputants had never met historically, you are often left with the feeling that it is a pity they didn't meet because it was such a nice conversation.

There is very little card stacking. It must be a great temptation to over draw the characters for dramatic effect. Take Machiavelli and Savonarola. At the beginning of this dialogue, Savonarola seems to be pouring forth vacuous ecclesiastical rhetoric. You are certain he is being set up as Machiavelli's straight man. Soon you see this is only part of the characterization. There are good lines and a plausible case for both men. Neither is pictured one dimensionally, and if ever there could be an understandable temptation to oversimplify characters, these are two very likely candidates. Instead we get a very fine discussion of the nature of force and fraud.

Friends of Rousseau might object that Cranston has been overly severe. Rousseau is drawn as a vulnerable and intolerant romantic. In their discussion of Progress, Diderot is continually upstaging him as the voice of calm reason. Rousseau is shown as essentially a Calvinist dreaming of a Christian Sparta. This questionable analogy suggests but does not begin to resolve the complex relationship of Rousseau's individualism and his collectivism. A rather awkward last minute introduction of his idea of social contract gives one the feeling that perhaps Rousseau was not getting equal time to present his case, or at least better arguments could have been mustered in his defense.

A similar feeling of being short changed in the dialogue comes up in the discussion of Tolerance between Locke and Shaftesbury. Locke is clearly the favorite. When Shaftesbury asks how Locke can dondemn all atheists *a priori* when we do not praise all Christians similarly, but rather insist on the test of experience, Locke never answers. The dialogue proceeds to another point. Once again a point has been hit but not developed. This is a definite limitation of the medium. One has to be content with sketches of ideas. Actually where responses assume essay proportion, as in the Mill and Stephen exchange, interest flags. The discourse has to be kept short to be effective, and this can result in skimping on ideas.

In a departure from the pairing of antagonists, third disputants are introduced into the dialogues on Revolution and Democracy. It doesn't appear that Mary Wollstonecraft (Why not her husband William Godwin?) is much help to Paine in taking on Burke. Her arguments are Paine's. But Morley contributes perspective in the exchange with Maine and Arnold over Democracy. His is an independent position and adds significantly to the dialogue.

The credibility of the dialogues is a strong point of the book. One's eyebrow seldom arches, but one does wonder if Marx could ever have shown such patience and forbearance in a real conversation with Bakunin over anarchism. Yet on the whole these excellent conversations ring very true.

These dialogues were presented over BBC Radio. They are meant to be spoken. The trick is to read them this way, to revel in their justapositions, sophisticated repartee, wit, and color and not look for a set of depth essays.—EDWARD R. CAIN, *Suny, Brockport.*

The Basic Values in Law: A Study of the Ethico-legal Implications of Psychology and Anthropology. BY THOMAS DAVITT. (Philadelphia: Transactions of the American Philosophical Society. Vol. 58, part 5, 1968. Pp. 144. $4.00.)

Any venture into the breach between disciplines

risks the likely consequence of being criticized only piecemeal and appreciated by no one. Yet some ventures may be worth the risks, since even a superficial punching and poking at the boundaries of our generalizations concerning social behavior may redefine some directions of inquiry. Professor Davitt's search for "basic values in law" must bear the scrutiny not only of his fellow jurisprudents, but of psychologists, anthropologists, and political scientists as well. But, regardless of the variety of shortcomings which might thus be levied against the endeavor, he asks us once again to consider the possibility of discovering (or inferring) universal value-judgments in the regularities of social behavior—and this means reassessing the possibilities for making comparative generalizations about legal "rules" or "norms" without necessarily contradicting our preoccupation with the study of decision-making processes which issue those norms.

Davitt presents his arguments for the universality of certain value-judgments in law in two parts: one linking values with law and the other surveying anthropological data for universal patterns of verification. In the first and much shorter part, it is argued that basic values—as certain appraisals of "our actions and their objects"—are derived from certain basic drives. The "naturalistic fallacy" is swept away by an insistence that "good" is merely an arbitrary designation for "the nonarbitrary and verifiable quality which some objects have of reducing drives, of fulfilling needs, of satisfying desires" (p. 8). And human motivations are presented as felt tendencies toward or away from objects, which are fundamentally evaluated according to the demands of basic drives. While not all actions are motivated and not all motives are *directly* related to basic drives, values are implied in all motivated activity. And lawmaking, it is argued, partakes of the motives, and hence the drives and values, common to all men. The basic drives, distinguished from instincts and characterized by a wide flexibility in means of fulfillment, are classified according to the familiar sort of motivational hierarchies which have been associated with the works of Abraham Maslow, Henry A. Murray, and Raymond McCall. Within the encompassing "master drive" of self-realization, man seeks self-preservation, sexual union, knowledge and freedom of decision, possession, and association in social and political unions. Further, Davitt contends that the basis of obligation and personal rights is derived from these basic drives, and that together values, obligations, and rights are the content of law.

Law, for Davitt, is particularly related to man's basic drives because the distinctive, definitional character of law—as a set of regulations—is found in its functional concern for the values common to all members of a society. Law if defined as "a directive judgment of those with authority regarding means necessary for the common welfare of the people" (p. 23). These directive judgments are distinguished from commands on the basis of general applicability and service to objectively common needs and values. Of course, since Davitt is concerned with data from preliterate peoples, he must insist with the directing authorities of law can be the people themselves, as well as their leaders or acknowledged delegates. And he hopes to clarify the proper inclusion of unwritten regulations in the identification of law on the basis of his notion of common welfare and the occurrence of public reaction to violations. Finally, it is argued that self-evident values in law are present universally (or almost universally) and require little or no reasoning or justification—while values which are not self-evident may be "general, common, frequent, and occasional," but not universal.

The second and greater part of the book is a presentation of the author's propositions about value judgments in law as their universality is supported by data from anthropological descriptions of preliterate societies. The universality of law, itself, is reaffirmed; and a classificatory schema is laid out for the location of value judgments along a continuum ranging from universal and almost universal through general, common, frequent, and occasional occurrences in societies. Of course, it is recognized that the reliability and inclusiveness of the evidence is only proportional to the accuracy and extent of the ethnographic reports; but Davitt argues that enough evidence is available to allow a classification of basic values in law which parallels his model of the basic drives encompassed by self-realization.

A brief overview of Davitt's findings reveals a small core of universal or almost universal value judgments derived from each of the basic drives—presented together with a much larger set of less than universal values. From the basic drive of self-preservation is derived the universal approval of self defense and regulations controlling killing, and condemnation of unjustified (relatively defined) killing. The drive toward sexual union delivers up such universal judgments as the approval of regulating sexual activity, of selectivity and permanence of relations, and of marriage and family. And the disapproval of polyandry, adultry, and incest are "almost" universal.

Man's drive to know results in the universality of values concerning the regulation of education and knowledge serving common needs, the good in language and artistic creation, and the desirability of cosmic explanations. The drive for freedom of decision is apparent in the universal values calling for regulations guiding decisions, the relating of responsibility to decisions to act, and even the

"decision" to observe customary law. The essence of justice, found in the basic drive to distinguish "mine and thine," is the basis for universal value judgments regulating property relations, allowing individual title, and regulating relations of acquiring title to things—to the exclusion of theft. Finally, the basic drive to associate with others accounts for the universality of judgments which value protection and security, the necessity for cooperative effort, regulations assuring peace and security, conformity with directives, and the pursuit of relatively defined justice through the judging of cases. Almost universal is the value of distinguishing between direct and indirect offenses against the whole community.

While for each of the categories examined extensive references are made to anthropological literature, the book should not be taken for a systematic survey of "legal anthropology" or even for a treatise on the impact of anthropology upon definitions of law. Neither can it be expected to contribute much to our understanding of the judicial process as an analytically defined aspect of social interaction. For this is primarily a book about legal norms—about the inferred presence of value judgments considered as "facts"; and it speaks most forcefully in the field of jurisprudence. Davitt's straw man is the *legal* positivist, for whom values as absolute ethical judgments are excluded from law defined as command. And he argues that the *universality* of certain value judgments, which through logic and an implicit functionalism can be inferred from regularities in widely comparative contexts of social interaction, is demonstrative of the *necessary* inclusion of basic values in all law.

For social scientists, *The Basic Values in Law* will be less than satisfying in a number of respects. Davitt never seems to understand the need to clarify the methodological questions involved in the identification of the regulations or customs which in particular are law. He uses the distinguishing characteristic of service to "common welfare," but does not fully recognize his implicit dependence upon the concept of observable sanctions—as "common responses" to violations. And this failure contributes to serious difficulties in demonstrating how a number of his value judgments, even if accepted as "reported data," are necessarily part of customary law. The entire chapter on knowledge and decision, in particular, seems to be a presentation of apparently universal regularities in behavior without any attendant demonstration that these regularities are law—or "regulations for common welfare." Davitt cites no clarificatory examples of public reaction or sanction for transgressions of the norms which might distinguish them as *legal* rather than merely general, *social* postulates!

While it can be left to the anthropologists to correct or alter any questions concerning the accuracy or generality of the data collected, we might note that except perhaps through some process of negative demonstration it is difficult to understand the operational criterion for selecting the content for the universal category. And, as we have seen, the guidance of the basic drives model seems to allow an unwarranted *forcing* of certain values into the legal framework. The additional and extensive outlining of "less than universal" value judgments proceeds according to some "considered estimate" of generality—often in the face of anthropologist's recognitions of the lack of sufficient data.

In spite of the shortcomings mentioned here and in addition to the fundamental emphasis on jurisprudential concerns, Davitt's work is an interesting exploration in the area of comparative generalization which presses to a wider audience the possible uses of anthropological data and fosters renewed interest in the comparative analysis of values as legal content. The work is worth critical examination, if only because of the implications of the topic.—D KENT MCCALLUM, *York University, Toronto.*

Totalitarian Rule: Its Nature and Characteristics. BY HANS BUCHHEIM. Trans. by Ruth Hein. (Middletown: Wesleyan University Press, 1968. Pp. 112, $4.50.)

The author, an associate of the Institut für Zeitgeschichte in Munich, has both personally experienced and written widely of the Third Reich. The book under review here is a translation of a work published in Germany in 1962—the first of his studies to appear in English. With just under 100 pages of text, the book can best be characterized as a long essay containing a number of impressionistic theories about totalitarianism. There is no attempt at systematic empirical description, nor at the construction of empirical indices for various factors which are related. Concrete evidence is brought in only when needed to illustrate a point. Evidence is drawn primarily from the experience of Nazi Germany and the Communism of the Soviet Union, with brief references for the purpose of contrast to Mussolini's Italy (considered nontotalitarian) and other fascist regimes.

In the first and longest chapter, the author defines totalitarian rule ("the demand for unlimited control over the world and hence social life"), differentiates it from other non-democratic forms, and suggests its motive force: a threatened group (the Germans; the working class) can only be saved if certain theories are acted upon as historically valid laws (the good life comes with the "nordification" of the German people; or with the achievement of communist society). To create a wholly new society and type of man, every area of life must be manipulated—the family, scientific re-

search, art, the individual conscience. From this arises the terrible oppressiveness of totalitarianism, which sometimes affects adherents of the regime even more than its opponents. The author also compares National Socialism with Communism and finds them more alike than different. Subsequent chapters examine life under totalitarian rule, especially various methods by which the regime seduces the populace into supporting it; the totalitarian goal of a life without politics; the totalitarian mode of thought and its historical antecedents; the role of the state in a totalitarian system (a tool); and the limits of totalitarian power.

To the author's credit, most of his theories appear reasonable and do not fly in the face of generally accepted knowledge about totalitarianism. This might be attributed, however, to the fact that there is little that is really new for the serious student—only here and there a novel emphasis or insight or different way of phrasing a well-known point. The lack of originality could not be considered a drawback if the author had attempted a synthesis of knowledge in the field. Unfortunately, he includes no footnotes, and except for a few references in the text, the reader is left unaware of how the author's theories have been influenced by the ideas of others.

In the several instances where theories are not convincing, the trouble seems to derive at least partially from theorizing at a level too far divorced from empirical referents. For example, the author attempts to explain the varying degrees of intensity of totalitarianism among fascist regimes by the relative lack of intellectual substance (e.g., clear-cut goals) in their ideologies, as compared with communist regimes. Thus, in the face of obstructions, such as "an ideologically solidly established society or strong political opposition," a Mussolini or Franco could "remain content with relatively minor changes" in society. Hitler's totalitarianism was more intense because the German body politic offered no significant obstructions. The author sums it up: "though Fascism contains the tendency to a totalitarian claim to power, it is not—unlike Marxism-Leninism—determined on such a course. . . ." The implication is that all communist regimes will have approximately the same totalitarian intensity, and a look at the real world would demonstrate that this is not true. In any case, without some kind of rough indicators of "intensity" or "intellectual substance" or "obstructions," it is impossible to say whether this theory seems valid or not. And the same criticism can be leveled against most of the author's theory-building.

Additionally, one can question the priorities which the author assigned in choosing topics to theorize about. For example, in explaining the success of totalitarian movements in Germany and Russia, the author focuses on very general conditions, such as man's yearning for a closed intellectual system or his proclivity in modern times for a rationalistic, social-engineering mode of thought, rather than on factors which seem more immediate, like the economic chaos of the two societies. Or in dealing with totalitarian politics, the author only makes the abstract point that the ruler cannot personally supervise everyone; thus, functionaries must necessarily exercise some discretion and thereby have political power. The author, however, does not take up actual manifestations of politics, for example, the interest group politics of the Soviet Union which seem to contribute so importantly to the dynamics of that system.

Because theorizing is done at a high level of abstraction with few references to concrete experience, this is not a work for a beginning student. To follow the author requires a great deal of knowledge about the real systems involved. Moreover, the vocabulary and manner of expression are not that of a modern, empirical political science, but a more formalistic school of German political philosophy. The knowledgeable lyaman might find the book interesting and worthwhile, however, for totalitarianism is intrinsically a fascinating subject, and theories about it are always provocative. And the political scientist might find it refreshing to be forced to reexamine his knowledge from a different persepctive. It is in these respects that the work has value.—RICHARD J. WILLEY, *Vassar College.*

Perspectives in the Study of Politics. EDITED BY MALCOLM B. PARSONS. (Chicago: Rand McNally and Company, 1968. Pp. 170. $7.50.)

According to the editor, the essays in this collection "attempt to explain how present-day scholars in disciplines other than political science view political phenomena, as well as how political scientists themselves view these phenomena." The former concern is the province of the eight contributors from other disciplines: Wayne A. R. Leys (philosophy), Norman A. Graebner (history), Harry W. Jones (law), James M. Buchanan (economics), Daniel Lerner (sociology), M. G. Smith (anthropology), Hadley Cantril (psychology), and Norman J. G. Pounds (geography). The latter concern is explored almost exclusively in editor Parsons' own introductory essay, which is essentially an historical sketch of trends in political science and a synopsis of the essays that follow.

Since there is no evidence of a prescribed format beyond the amorphous formulation quoted above, it is not surprising that the remaining essays are extremely varied in approach. They can, however, be sorted into two broad categories. In the first category (comprising the essays from phi-

losophy, history, law, anthropology, and geography) the emphasis is on the relationship between political science and the approaches, concepts, and theories of the other discipline. The essays in this category are all informative, and, in many instances, they contain provocative ideas as well.

For example, Wayne Leys suggests that the unstable pluralism of contemporary political reality generates a central philosophical question: "How can a man, dealing with different issues in different kinds of games, achieve some sense of personal integrity and preserve his sanity?" On the way to an answer, we must somehow "escape from an idolatry, a worshipping of one kind of political process" and "secure and make available promptly accurate information regarding the consensus of effective participants as to the arena in which a given issue should be decided." This point of veiw seems eminently worth exploring.

In the essay from history, Norman Graebner states that, in his view, "social science cannot subject mankind to successful predictability." As a consequence of this estimate of the possibility of prediction, "the majority of practicing historians pursue their researches unmindful of the content of the new empirical studies." This state of affairs we must regret, and we hope that such barriers to disciplinary cross-pollinization are only temporary. (We might note that the use of the verb "subject" in the first quotation suggests an underlying ideological anxiety, a fear that mankind is perhaps predicatable after all, that scientific laws will be constructed "which will control human activity." We suspect that it is this unfortunate and, we believe, inaccurate equating of prediction with control that contributes to a lack of communication between history and political science.)

In the contribution from law, we have a concise and informative summary of legal research relevant to political science. The contributions from anthropology and geography both summarize and critically evaluate their disciplines' progress toward creating theoretical perspectives. Overall, this entire first category of essays provides useful introductions to recent work of relevance to political science.

In the second category of essays (comprising the contributions from economics, sociology, and psychology) the emphasis is on the personal theoretical approaches and ideas of the authors. James Buchanan, for example, fashions an argument against traditional treatment of political institutions by economists and in favor of what he calls "methodological individualism," an approach he and Gordon Tullock first championed in a major way in *The Calculus of Consent*. This sort of intentional semipolemic should help sharpen needed investigation into theoretical and methodological assumptions and approaches.

Daniel Lerner discusses the relation between sociology and policy research, not political science. How he relates the three remains somewhat unclear at the end of his contribution, over a third of which is a quotation from an earlier publication.

Hadley Cantril summarizes a number of his ideas within the framework of "transactional psychology," a term handed down from Dewey and Bentley. For political scientists, one of his more useful notions may be a classification of motivations, of "demands the human imposes on society." Among other things, this kind of effort may contribute to a more adequate way of describing and evaluating the effects of governmental decisions.

In sum, the essays in this volume, allowing for occasional lapses, are of good quality. Individually, they are worth the serious attention of the political scientist. However, granting that academics are notoriously difficult to hold to a common format, this collection inevitably suffers from discontinuity. The contributors scatter to the four winds, and, to be fair to them, there is no evidence of a serious attempt on the editor's part to keep them corralled. All this may be a function of a more general problem—the poorly defined purpose of the volume. Nowhere does the editor clearly state how interdisciplinary relationships were to be explored or what audiences he had in mind. It cannot be denied that there may be value in giving a number of intellects free rein with a given subject matter. However, in this context, with just one selection per discipline, the non-comparability from one essay to the next lessens the impact of the work as a whole.

The interrelating of political science and other disciplines is a topic of considerable importance. This volume indeed contributes to the understanding of these relationships. It seems to this reviewer, however, that the issues involved deserve far more explicit and extensive probing. To this end, a format which, for each discipline, would elicit the viewpoints of *several* of its representatives and *several* interested political scientists could be of inestimable value. (The interdisciplinary sections of Sidney Koch's edited series, *Psychology: A Study of a Science*, are a fair approximation of what we have in mind.) We need thorough discussion of such issues as the extent of substantive overlap among disciplines, the validity of borrowing theories, concepts, and methods, and the potentialities and dangers of interdisciplinary research. Hopefully, the present volume will help provide an impetus to these more ambitious undertakings.—ALLEN R. WILCOX, *University of Nevada*.

Hobbes's System of Ideas: A Study in the Political

Significance of Philosophical Theories. By J. W. N. Watkins. (New York: Barnes and Noble, Inc., 1968. Pp. 192. $1.95.)

In view of Hobbes's secure position as the most exciting and profound of all those who have written political philosophy in English, it is surprising that the amount of secondary literature about him which is both valuable for beginning students and interesting to more sophisticated readers is very small. Watkins has furnished a welcome addition to our small resources in these respects; his book is well-written, responsible, provocative, and altogether a pleasure to read. If the purpose of a review is to advise the relevant public whether a book is worth reading, the answer here is unhesitatingly in the affirmative.

There are some disappointments. Watkins' considerable abilities are apparent, but so also is a certain negligence in ordering his thoughts. The opening lines of the Preface state that the book answers the question: "How much of Hobbes's *political* theory is implied by his *philosophical* ideas?" It takes a close reading of the text to find the reply to this question and when found it is extraordinarily inconclusive. Fortunately, political theorists are less interested in such implication than in consistency, and about Hobbes's consistency there are only marginal doubts.

The organizing principle of the book is not evident; topics follow one another in no particular order. No serious attempt is made to convey an overall view of Hobbes's philosophy or political thought, to relate his thought to his period, to show what problems he attempted to solve, or what influence those solutions had. Of course, a book which attempted to do *all* these things might be intolerably long, but one or some of them might have been attempted, particularly given the author's gift for vivid and accurate summary.

The best parts of the book deal with topics in metaphysics. The author treats clearly and well of Hobbes's nominalism and materialism-motionalism and discovers what I believe is a previously unnoticed connection between Hobbes and Leibniz which increases considerably our appreciation of Hobbes's intellectual power and originality. More conventionally, but in a section which is a model of critical exposition, Watkins explains the relation between Hobbes's scientific approach and that of Galileo and earlier members of the School of Padua. More of this would have been a welcome addition.

A major topic in recent Hobbes literature has been the character of the obligation to obey the laws of nature in the state of nature and the relation of that obligation to the obligation to obey the laws of the sovereign in civil society. Watkins argues persuasively for what I suppose is now the general opinion, that such obligations are neither moral nor religious, but prudential. More precisely: "Hobbes's laws of nature are assertoric hypothetical imperatives in Kant's sense." (p. 83) In a footnote (p. 99), Watkins relates the contrary Taylor-Warrender thesis to those recent studies of Locke which tend to assimilate the latter to the austere authoritarianism usually associated with Hobbes and says:

> This situation is painful for examination candidates liable to be asked to 'compare and contrast' Hobbes and Locke. So let us all agree to the following compromise: Hobbes was a moralizing lawyer in the Hooker tradition, while Locke preached a mixture of egoism, fear, and authority; and Hobbes wrote *The Second Treatise,* while Locke wrote *Leviathan.*

The author writes from the standpoint of the contemporary English analytic school of philosophy ["My largest debt is to Karl Popper. His has been the main influence on the viewpoint from which the book is written . . ." (p. 11)] and the cramping effect of that commitment is visible throughout most of the book. On occasion, however, the commitment seems forgotten. On pp. 175–6, in connection with a discussion of Hobbes's definition of liberty as the ability to do what one wants, Watkins asks us to imagine two members of an underground organization in a totalitarian country, both of whom are captured and 'brainwashed.' A is rehabilitated and released and gets a good job with the regime; B successfully resists conversion and is sent to a labor camp:

> A is doing what he wants to do, B is not. But there is an important sense in which it is A who has become a captive of the regime, and B whose soul has remained unenslaved, although he is now doing slave-labour. Hobbes's concept of liberty makes no provision for this sort of inner defiance.

Is Watkins sending the founder of linguistic analysis back to study under Plato and Spinoza? Perhaps Watkins himself should go, for here, and elsewhere in discussing justice and morality, he transcends his adopted viewpoint only to land at the most unsophisticated level of the traditional normative position.

Watkins labels his own criticisms of Hobbes's political conclusions "pedestrian" and as only his "personal opinions." They are indeed pedestrian in the sense of being commonsensical, *i.e.*, culture-bound and ideological, but what it means to label them "personal opinions" escapes me. Is it implied that there is some transcendental ground of criticism which he admits not having reached, or some scientific approach which he has not mastered, or does it simply mean that we are not to take his thoughts here seriously? The reader will probably prefer the last alternative.

Yet, despite all these imperfections, it must be admitted on balance that Watkins has produced an excellent book. In the many matters on which he is competent, he shares with Hobbes some of

the latter's inimitable instinct for the jugular, in instinct well appreciated by our best students. Perhaps, given a prior feeling for politics, history, and humanity, no other characteristic is more important in writing or understanding political theory.—ROBERT J. MCSHEA, *Boston University.*

Social Science in Latin America. EDITED BY MANUEL DIÉGUES JÚNIOR AND BRYCE WOOD. (New York, Columbia University Press, 1967. Pp. 336. $4.50.)

One does not expect discussions of scope and purpose in the social sciences to be particularly illuminating; this collection of papers presented at the Conference on Latin American Studies in Rio de Janeiro in 1965 confirms this apprehension. The contributors, all Latin Americans, were brought together under the auspices of the Joint Committee on Latin American Studies of the American Council of Learned Societies and the Social Science Research Council "to reinforce the bonds among social scientists in this hemisphere." The Conference may well have succeeded doing that, but the published papers add little more to the effort. Two of the essays are useful bibliographical contributions, one on Anthropology by Fernando Cámara Barbachano and the other on law and legal sociology by José María Franco. The other papers are confusing and unstimulating. This result reflects not so much shortcomings of the authors themselves but rather the difficulties inherent in addressing issues of scope in the abstract.

The scope of a discipline is the result of thousands of scholars producing, criticizing, modifying and extending specific lines of enquiry. Thus, a book review is a discussion of scope. The writer argues, in effect, that a particular topic should or should not be pursued in a particular way for these or those reasons. Obviously one cannot, in a single paper, make all the specific criticisms and corrections of all the work appearing in the discipline. Consequently, a generalized discussion of scope is usually a covert book review: the works treated are often unmentioned and the specific criticisms rarely detailed. The result is shadow-boxing.

In his Introduction to the collection Manuel Diégues Júnior criticizes "foreign experts, whose models, although carefully prepared and highly refined, are rarely compatible with the social reality of our own countries" (p. 12). Which experts? Which models? Which reality? Why, specifically, are they not compatible? The author does not say.

Florestan Fernandes inveighs against North American scholars working in Latin America for diverse vices: being "more or less indifferent to what is happening in Latin American communities" (p. 53); holding "old stereotyped opinions about the significance and scope of indigenous advances [in the social sciences]" (p. 51); being, "as a rule, completely ignorant of the language and of the economic, cultural and social history of the areas selected" (p. 32). No names are given, no works cited; far worse, no concrete—let alone detailed or thoughtful—defense of such propositions is offered. It is tempting to criticize such criticisms, but to do so would plunge us into the same lack of concreteness which afflicts the criticism. We desperately need specific examples. If, for example, Fernandes knows of a neglected Latin American scholar, then for Heaven's sake, he should tell us about his work and explain its utility.

José Nun, writing on political science, argues that political philosophies—such as Marxism or liberal capitalism—are our "models" performing a function akin to that of the wave theory of light in physics. (Many of us would feel slippage between analogies.) Nun then speaks against certain philosophical positions and in favor of "critical Marxism" as a research model. Unfortunately, he does not explain what, in practical, concrete terms, the significant characteristics of each "model" are, nor how, specifically, each leads or does not lead to knowledge.

The writers of *The American Voter* are, for example, accused in a passing reference of "formalism" (p. 80). Formalism, incidentally, is "an ideology of liberal capitalism" which combines a "liberal democratic conception of politics" which is a belief in "equality as a function of liberty" and an "irreducible dualism: society and state" (see Locke, Hartz, Hobbes, Laski and Hegel for further clarification) *and* an abstract view of man which is man defined "by his essence"—if you know what I mean. Obscured by this metaphysical fog is the issue of interest to political scientists: what specific findings in *The American Voter* are undermined by the use of "formalism" (whatever it be) and how? Nun makes no attempt to show it. We are left with mere name-calling—only we do not even know what the names mean.

Melioration was one theme which appeared in most of the papers. The writers seemed agreed that research ought to be undertaken with the end of eventually making things better in Latin America. But again, the high level of abstraction prevented the concrete discussion of the real issue here, namely: which specific lines of enquiry lead most productively to useful knowledge and why? For example, what are we to make of the rhetorical question raised by Victor Flores Olea in his discussion of political science: "Are Latin American specialists only to be concerned with reinforcing the status quo and, ultimately, with defending and justifying an order that is unsatisfactory for the majority of the people, and, at times, unjust

all around?" (p. 185) Is this merely banal demagogy or an exhortation to terrorism? No answer is provided by Flores who does not say *who* is justifying *which* unsatisfactory order, *how*. Which book is he reviewing?

The results of this conference suggest, then, that formal discussions of scope and purpose ought to be avoided in favor of substantive matters where issues of scope and purpose will be explicitly—and therefore productively—addressed.—JAMES L. PAYNE, *Wesleyan University*.

Social Class and Social Policy. BY S. M. MILLER AND FRANK RIESSMAN. (New York: Basic Books, 1968. Pp. 302. $7.95.)

At a time when social science is being asked to appraise and reevaluate its relationship to social problems (e.g. the "new sociology," the "new political science"), this volume by two scholars unambiguously committed to *applied* social science, is an excellent exercise in problem-science linkages. S. M. Miller, who is Professor of Sociology and Education at New York University and Program Advisor in Social Development at the Ford Foundation, and Frank Riessman, Professor of Educational Scoiology and Director of the New Careers Development Center at the same university, make it quite clear from the outset that the book represents a bridge between their concern with social problems and social change, and their social science training and interests. They are committed to a dialectic between social science and social problems: to develop and test social science theory by applying it, while enhancing the utility of social science to "actionists" by clarifying problems, and aiding in the development of effective strategies and techniques to solve them.

Although one would have to conclude that the book is primarily devoted to action programs and change strategies, these programs and strategies are based on sound analyses of existing situations in three substantive policy areas (poverty, education, mental health). The student of public policy will find many significant and useful insights, conceptualizations and typologies in this volume. However, both the action-oriented and the theory-oriented reader will have to pour through material of primary interest to the other in order to get at the parts he is primarily interested in. Both ought to benefit from the exposure.

Substantively, *Social Class and Social Policy* is about urban poverty and the urban poor (the "new working class") in America. The eighteen chapters of the book are divided into six sections. The opening section ("Policy Objectives") outlines what the authors call the "relative view of poverty," i.e., relative to the "possibilities of society and the 'average' standard of life in a society." To be poor is to be excluded from full membership in society. They criticize the "insufficiency of income" theory of poverty as inadequate, and offer a more broadly conceived concept of "inclusion through command over resources"—economic, political, service, psychological, and social. In an affluent society, the reduction of poverty involves increasing the range of meaningful choices in relation to the choice increase of the non-poor.

The next three chapters ("Social Class: The Poor Today") characterize the current state of poverty. The utility of distinguishing among the plurality of poverty types is stressed. By combining measures of class (economic security/insecurity) and life style (familial stability/instability) Miller and Riessman develop a typology of poverty diversity (stable, strained, copers, unstable). The authors assume that there are alternative poverty alleviation or melioration strategies available (direct economic aid, direct services, indirect change through "climate" changes) and suggest that the concept of poverty diversity is useful in fitting policy program to poverty type in order to maximize the amount of positive change.

In addition to a typology of the poor themselves, Miller and Riessman analyze and critique the major alternative views of the poor—the underserving poor, the self-defeating poor, and the victimized poor—indicating how definition of the problem affects program proposals. Expectedly, they use this opportunity to criticize the "culture of poverty" thesis (a broader version of the self-defeating poor which implies "an intergenerational transmission of values and practices which inhibit constructive action") as unduly pessimistic. They insist that the positive qualities of the poor be emphasized if successful programs are to be developed.

Sections III, IV, and V, which constitute two-thirds of the book, critique three policy areas relevant to the poor—education, mental health, and community action programs. What we aren't told however, is why *these* three; no criteria of inclusion or exclusion are offered, despite the fact that mental health is not usually considered to be as critical as, say, housing or the welfare system.

The discussions of all three policy areas stress the necessity for developing a variety of "social interventions" to cope with the pluralism of poverty. In the six chapters on education, there is strong emphasis on flexibility and adaptability to get out of the "credentials trap" which represses the mobilization of what talents the poor have, to deal with the drop-out problem (education is a "discontinuous process") by providing meaningful "second chance schools," by accepting poverty and policy pluralism and avoiding the one solution syndrome in school administration, teacher training and utilization, pre-school programs, and integration (where a rigid position in opposition to seg-

regated community control seems contradictory).

The plural approach to change strategies is continued in the section on mental health, where current institutional features of psychotherapy are described as "not congenial to low-income clients, not congruent with their expectations and traditions, and poorly understood by them." Miller and Riessman suggest modifying treatment approaches (e.g. introducing role-playing, use of non-professionals, "helper" therapy, family approaches, socio-therapy, and "pills and needles"), in addition to educating the poor to create new or modified expectations about treatment.

The four chapters which comprise the section on "Poverty and Community Action" are concerned with the variety of forces acting to alleviate poverty and improve conditions of the poor. Three forces are identified: the "inside" force of the established social agencies which constitute the social service network, "outside" militant pressure groups, and mediator agencies which work with both the inside and outside groups.

In light of the new action framework created by the war on poverty and the civil rights movement, new and more innovative programs and processes that are relevant to the demands and needs of the poor are suggested for the traditional agencies: neighborhood service centers, consumer participation in conduct of services, and the widespread use of non-professionals.

The conflict-confrontation oriented outside groups (examples cited are Alinsky and the New Left) are considered too revolutionary, and concerned too much with increasing a sense of efficacy among the poor and too little with substantive gains.

The "third force strategy" of the local poverty programs (CAPS) is designed to promote change in social service activities without inevitably creating community disruption. The strategy stresses intervention between the demanders (poor) and the suppliers (established community institutions). Although the authors, consistent with their concern with pluralism, insist that all three strategies have merit depending on the circumstances, they clearly favor the community-action strategy which "offers social delivery, not a social movement or a comforting continuation of past programs."

Despite the analytic insights spotted throughout the volume, the book suffers from theoretical eclecticism, substantive exclusion and unevenness of development. This may be the result of the division of labor among the authors (including several, in addition to Miller and Riessman, who co-authored some chapters). But this should not detract from the important insights into significant urban issues nor the highly relevant treatment of the policy science question. Besides, the authors promise us a follow-up volume in which they will distill the implications of their analysis for general social science theory. Hopefully, the promise of *Social Class and Social Policy* will be fulfilled in the authors' next book.—Louis H. Masotti, *Case Western Reserve University.*

Freedom and Community. By Yves Simon. Edited by Charles P. O'Donnell. (New York: Fordham University Press, 1968. Pp. 201. $5.50.)

Yves Simon was one of the foremost Thomist theorists of democracy. All those of us committed to constitutional democracy who have recognized the accuracy and significance of Paul Tillich's observations that "the intellectual defense of Anglo-Saxon civilization against Fascist ideologies is extremely weak," and that "common-sense philosophy and pragmatism are not able to provide criteria against the dynamic irrationalism of these movements" should regard with interest and appreciation Simon's conscientious attempt to make good this theoretical deficit from his own philosophical perspective. Simon concentrated his attention especially upon the too-often neglected problem of the role of authority in democratic society. The impetus behind his work was the conviction that a proper understanding of constitutional democracy can be obtained only through an appreciation of the interplay of freedom and authority—concepts which were widely and facilely held to be unqualifiedly antagonistic under the premises of classical liberalism's ontological simplicism.

For those who are not themselves either Catholics or Aristotelian universalists, however, Simon's answers to the critical problems he examines are bound to seem *ultimately* unsatisfactory. Admittedly, democratic liberty certainly must be conceived as something other than simple license ("absence of impediment," to use Hobbes's phrase), and we are in Simon's debt for his insistence on this score. But on the other hand, surely it is an excessive contraction of the notion of freedom that leads to the belief that "any guarantee against the risk of a wrong choice is purely advantageous to freedom as such." (p. 59.)

At a critical juncture the Catholic belief in and adherence to an institutionalized principle of authority which must be accepted on faith is perhaps not fully able to assimilate the deep epistemological humility in the realm of moral knowledge that is so basic to the rationale of constitutional democracy. Nevertheless, no political order, democratic or otherwise, can survive a complete lack of authority or complete moral skepticism, for order of any kind is incompatible with genuine anarchy or total nihilsm. As political theorists try to discern the distinguishing features of democratic political order, therefore, they can profit

from the thoughtful, theoretically sophisticated formulations of Simon, a committed and insightful analyst who took these problems seriously.

The present volume is a collection of six essays centered broadly around the problems of freedom and community. The editor, Professor Charles O'Donnell, remarks that *Freedom and Community* is intended to exemplify the author's dedication to freedom, a dedication which O'Donnell suggests may have been obscured by the fact that Simon's work "has been so closely associated with the idea of authority." (p. ix.) In fact, the general belief that Simon emphasizes the centrality of authority in any society, including democracy, will probably not be substantially modified by this book. It conceivably can be argued that freedom, rather than authority, was actually the central concern of his theory of democracy; but to do so it must be admitted that Simon's distinctive concept of "freedom" jettisons some of the elements which have generally been considered essential to that word's meaning.

Three of the six chapters have appeared previously in other formats. These previously published essays, "Freedom in Daily Life," "Liberty and Authority," and "Pessimism and the Philosophy of Progress" are by literary standards the most satisfactory parts of the book. The remaining essays, "Freedom and Community," "Autonomy and Authority," and "Political Society," previously unpublished, are manuscripts that Simon originally prepared as the basis for lectures given at the University of Chicago in 1955, and which he intended ultimately to comprise part of his proposed "Philosophical Encyclopedia." Since the manuscripts were still in incomplete form at the time of the author's untimely death in 1961, the editor has utilized notes which Dr. Vukan Kuic took from the original lectures as aids in supplementing them.

Admirers of Yves Simon will certainly be grateful to Professor O'Donnell for his efforts in making these essays available, even though the logical coherence and completeness of the new chapters is not all that might be desired. The editor understandably and wisely sought to keep his interpolations to a minimum; and the relative sketchiness of the final copy is an unavoidable result of this editorial fidelity. Nevertheless, the final product is a group of essays whose quality is not quite up to the usual standard of Simon's work; they are rough-hewn wood-work rather than polished gems. The present volume, therefore, constitutes a rather marginal addition to Simon's *corpus*, as the editor himself would undoubtedly attest; but in the case of thinkers of Simon's stature margins may justifiably be deemed significant.—THOMAS A. SPRAGENS, JR., *Duke University.*

The Political Philosophy of Rousseau. By ROGER D. MASTERS. (Princeton: Princeton University Press, 1968. Pp. 464. $12.50.)

Among the many books on Rousseau's political philosophy, this one stands out because of its form. Some of Rousseau's major works are considered, in turn, as whole books: the *Emile,* the *Discourse on the Origins of Inequality,* the *Social Contract,* and the *Discourse on the Arts and Sciences.* Reading a work written in this manner is almost always instructive for the reader because he can learn about the author by matching his understanding with that of the interpreter in the face of the text as it was meant to be read. This is true of Masters' books because it does contain some extraordinarily interesting remarks about Rousseau's writings.

What can we ask of a work written in this form? Unlike a commentary on one work, it does not attempt exclusively to find out the author's question and his answer. Rather, Masters examines a number of Rousseau's books in order to find out about his political philosophy. Because of Rousseau's pervasive concern with politics, it is clear that his whole teaching can not be found in any one book. One must accumulate an understanding from several of his works in order to have a full grasp of his politics. To come to such an understanding, Masters must examine a number of Rousseau's books in some order. The sufficiency of that understanding depends upon a wise choice of books, and the adequacy of the exposition depends upon the order in which they are presented. In examining Masters' work about Rousseau's political philosophy, one needs to question both the choice and the arrangement of the books to be analyzed as well as the understanding of particular books.

In respect to the arrangement of books to be considered, Masters' book is also different from most books about Rousseau's political philosophy. It begins with the *Emile,* proceeds to the works commonly understood to be the theoretical ground and theoretical exposition of Rousseau's political thought. It does not approach those such as the *Considerations on the government of Poland* and the *Letters Written from the Mountain* in which Rousseau is commonly thought to have expressed his practical recommendations for governments. Thus, Masters could be understood to go from an introduction, to the theoretical ground of the political works in the *Discourse on the Origins of Inequality* and the *Discourse on the Arts and Sciences,* to the *Social Contract* itself. At this point he should be in a position to understand the *Social Contract* thoroughly, perhaps without reference back to the more practical works, particularly considering his discussion of the comments

on the Roman government in the *Social Contract*.

Reading the *Emile* as an introduction to Rousseau's thought needs no defense. It was certainly one of Rousseau's most popular works, and it contains many comments on government. In addition, as Masters notices, Rousseau said that it was one of his major works and recommended it in the *Dialogues* as an introduction to his thought. The question then arises of what kind of an introduction the *Emile* could be. Masters says a number of times that the *Emile* is like a novel. But a novelistic work that could introduce a political philosophy is not simply book with characters that is easier to read than a treatise. In order to read such a work, it is necessary to be aware of the places where philosophy could appear, from which one could move from a novelistic impression to philosophic questions. A novel, at least at the time of Rousseau, had characters who acted according to the principles of human action understood by the author and whose fates were determined by the author's understanding of the way things happen. In the *Emile,* this is made evident by the presence of the tutor, who shapes the environment in which Emile grows and against which he is tested. Masters, however, treats the *Emile* as if it were a treatise, rather than a novelistic work grounded in philosophy. For example, although he remarks that the "confession of the Savoyard Vicar" was an "exoteric" discourse in the midst of this novelistic work, he treats its religious and metaphysical conclusions as if they were Rousseau's most profound. The consequence is that he turns up with a "detachable metaphysics," not required for Rousseau's other arguments and positions. Thus, although the *Emile* could be a good introduction to Rousseau's philosophy, Masters does not treat it as an introduction.

This same attitude toward the form of books is illustrated by his treatment of the *Discourse on the Origins of Inequality*. Although he understands this work to be a history of man, he does not inquire into the kind of history. He seems to think that men progressed evenly from the first page to the last, history being movement, as if there were no philosophic reason for its division into two parts. But one of the most striking things about the division of the *Discourse* into two parts is that a number of topics are covered in both parts. For example, there are two discussions of the origins of language, one demonstrating that it is impossible to develop language in the state of nature and the other how it could have developed. Masters' failure to observe this leads to his conclusion that the family could be understood to exist in the state of nature. One can make the mistake of reading back into the arguments for the most isolated state of nature, those considerations required to understand man's emergence from it. There clearly must be a relation between the two arguments, but it can only be understood after their differences are identified.

Although Masters' book does have these problems, it has the virtue, in contrast to much of the literature about Rousseau, of bringing our attention back to Rousseau's works and to the problem of what they say about politics.—ANNE M. COHLER, *Harvard University*.

Mass Behavior in Battle and Captivity: The Communist Soldier in the Korean War. ED. BY SAMUEL M. MEYERS AND ALBERT D. BIDERMAN (Chicago: The University of Chicago Press, 1968, Pp. 377. $11.00.)

This book may be of more than passing interest to students of military history but defects of method, presentation and insulation from major relevant literature severely limit its utility for the broader audience to which it is addressed. The book consists of five studies drawn from interviews with 118 North Korean and Chinese prisoners of war conducted, under the direction of the late William C. Bradbury, during the latter part of the Korean War. The stated purposes of publishing this material are: "to make available a body of data and . . . interpretations both to those interested in the China field and to those concerned with political warfare . . ." and to contribute "specifically to the understanding of Communist authority patterns."

In fact, however: 1) relatively little of the open-ended interview material is presented so that the reader will find it difficult to judge the appropriateness of the interpretations; 2) the interpretations themselves indicate only that a given variable is relevant but less of how it functions and almost nothing about its relative importance; 3) the interpretations are not explicitly related to more recent related research on the consequences of captivity (indeed, virtually none of the items in the bibliography post-date the middle 1950's); and 4) the methods used to secure the data make suspect the applicability of the interpretations, even to the population of Communist prisoners of the Korean War, let alone to Chinese or Communist socio-political authority patterns.

Forty-five interviews were conducted with Chinese prisoners of war. These interviews were conducted in an atmosphere of urgency because it was known that the respondents would "momentarily be moved," or a sample chosen as "knowledgeable" by the U.N. command, the judgment of U.S. compound officers, interpreters and even prisoners. The stimulus situation varied (not only by locale within the prison compound but by relative

freedom—two interviews were conducted in a Prison restaurant, three in the U.S. a year later), the topics covered in the interview varied; the order of interview varied; recordation of response was unsystematized. No member of the research team spoke Korean or Chinese, so that all interviews were conducted through interpreters who were U.S. Army employees who had worked with the prisoners.

The editors are quite candid about these seeming shortcomings in design, but adopt Bradbury's assertion that knowledge about these phenomena is so meager that the studies are nonetheless valuable. Perhaps they will prove heuristic. Bradbury himself, however, argued that one could generalize from this data to Chinese Communist practices and their consequences. He writes: "At this stage in investigation . . . (we) are in the position of the boy who wants to find out whether the white crystals in the bowl are sugar, salt, or something else—tasting a pinch or two of crystals from the top will tell him what he wants to know." But this is true, of course, only if we assume that all the crystals are the same—that the sample of one or two crystals from the top does reflect the composition of the bowl. By the sampling procedures used here, we would expect to find systematic differences between these respondents and even the population of POW's and the data presented in Appendix A corroborates this.

If the problems in research design were necessitated by the pressures of the research situation, they might be at least somewhat alleviated by imaginative analyses of the data. Unfortunately, the coding procedures and the principles of evidence used by the authors in reaching their conclusions are not clearly presented. The analysis seems to have been largely intuitive. The editors suggest that this historical-descriptive mode of presentation was necessitated by the critical review of the government research sponsors. Perhaps, but maintaining this mode could not have been a precondition for permission to publish. It would have been considerably more useful if these pieces had been revised to more adequately present both their analytic procedures and the relationship of their findings to more recent research on prisoners of war, prison inmates, and others in captivity situations.

Although the book as a whole suffers from these defects, readers will find some idea or fact of interest in each of the individual chapters. Bradbury and Jeanne J. Kirkpatrick's "Determinants of Loyalty and Disaffection in Chinese Communist Soldiers . . ." presents a most balanced assessment of the utilities and disutilities of Communist control techniques and includes a fascinating 20-page series first-person vignettes of careers under initial post-revolutionary Communist control. Samuel M. Meyers' chapter, "The Role of Traditional Orientations Toward Social Relations in Chinese Responses to Communist Military-Political Control" not only traces the concern indicated in the title but indicates the centrality of physical coercion behind the effectiveness of Communist political-military control. Kirkpatrick and Uliassi's chapter, "Adjustment . . . to the Communist Demand for Ideological Participation" indicates how enforced verbalization of ideology functions as counter-attitudinal dissonance to achieve new loyalties for the Communist regime and shows how the Chinese Communists, in post-revolutionary consolidation, used the concomitant decrease in "real" communications to prevent institutionalization of anti-regime alienation. Finally, Meyers' and Bradbury's "The Political Behavior of Korean and Chinese Prisoners of War in the Korean Conflict: A Historical Analysis" is an interesting topical and chronological presentation of the surprising behavior and behavior shifts among the Communist POW's.—DAVID C. SCHWARTZ, *University of Pennsylvania.*

The Human Organization: Its Management and Value. By RENSIS LIKERT. (New York: McGraw-Hill, 1967. Pp. 258. $7.95.)

In this book Professor Likert describes more fully and supports by additional research the "System 4" concept of management originally outlined in his previous book, *New Patterns of Management* (1961).

Most academicians would place this volume in the human relations field of organizational studies, although its author specifically denies this categorization. The system of management proposed focuses upon the accomplishment of organizational goals by satisfying employees psychological and social needs. This focus, perhaps with the emphasis upon the individual need satisfaction, has been the primary concern of human relations theorists for some time.

Most books concerned with human relations in management have a missionary zeal about them. Professor Likert's book has this enthusiasm. It also offers some interesting research data to support his "scientific-based system of management," labelled System 4.

System 4 is composed of a number of different "principles" which should be followed by managers in administering an organization. One principle, concerned with motivational forces within the organization, calls for more effective use of non-economic motives to create cooperative attitudes and behavior among organizational members. Another principle recommends group decision making at all levels of the organization. A third principle concludes that group methods of supervision are best. Other System 4 principles are dedicated to insur-

ing that each experience of each individual will, to the extent possible, build and maintain his sense of personal worth and importance. The book contains other "principles."

Proof that System 4 is the best method of managing an organization is provided by empirical data gathered from members of many different firms. One study quoted at some length involved a business firm with approximately 100 branch sales offices. The researchers requested salesmen from the best 20 sales offices and from 20 other sales offices chosen at random to complete a questionnaire regarding their branch sales manager. The questionnaire was designed to ascertain the extent to which each branch sales manager incorporated important System 4 principles in his system of management. The results showed that the managers of the best offices were, for the most part, applying System 4 principles to a greater extent than the managers of the other twenty units.

Data from other studies is similarly examined.

Another concept presented by Professor Likert involves the division of organizational variables into three groups—causal, intervening, and end-result. Causal variables are those which determine the course of developments within an organization and which can be changed by the organization's management. These include organizational policies and behavior. System 4 principles such as group decision making and supportive relationships are causal variables.

Intervening variables reflect the internal state of the organization, e.g., the attitudes, motivations, and perceptions of its members. The condition of the intervening variables are the result, largely, of the causal variables.

The end-result variables are the achievements of the organization, e.g., productivity, costs, and earnings. These variables are influenced by the intervening variables.

Professor Likert points out that the usual method of calculating a firm's assets is in measuring the end-result variables. Since these end-results are dependent upon the other organizational variables, he recommends that causal and intervening variables be measured. This is especially important because fostering causal variables recommended by System 4 may not make an impact upon end-result variables for 2 or 3 years. Further, a manager can rapidly liquidate important causal and intervening variables—employee loyalty, quality standards, customer loyalty—and show a temporary increase in end-result variables, e.g., profit. Thus, unless causal and intervening variables are measured regularly, one may be over-rewarding managers who and supporting policies which are destroying important long-term organizational assets.

The book mentions ways causal and intervening variables can be measured, but cautions that only experts can take and evaluate these measurements.

While it claims to be applicable to both business and goverment, this publication is written with only an incidental eye for the governmental entity. The management techniques might be applicable to a broad range of organizations in our culture, but the causal/intervening/end-result variables concept is of limited value to organizations with significant problems in end-result definition and measurement.

The author suggests that his System 4 principles constitute a theory of organizations. However, his area of concern in the organization misses important elements which should be included in any organization theory. For example, the tasks which his organization members are performing are somehow given in advance. In the usual organization, decisions must be made as to what the employees of the organization will do. This important decision-making function is outside the purview of System 4 principles. Many of the tasks Philip Selznick assigns his "institutional leader," such as assessing and coping with the external demands upon the organization, are not touched upon in this book. Rather than being an analytically descriptive theory of organizations, System 4 is a prescriptive set of recommendations or principles for managers. As such, the book has value.—JAMES F. SULLIVAN, *University of California, Riverside.*

AMERICAN GOVERNMENT AND POLITICS

The Goldwater Coalition: Republican Strategies in 1964. By John H. Kessel. Indianapolis: Bobbs-Merrill Company, 1968. Pp. 371. $8.50, $4.75, paper.)

Far more than is usually the case, this is a book written on a numbler of levels—at least three, according to my reading. It is an account of Presidential politics in 1964; it is an analysis of the campaign strategies of the Johnson and Goldwater camps and an appraisal of their effectiveness; and it is an attempt to cast the events and reactions of 1964 into a broader theoretical approach to parties and politics. This review will move through these levels and in that order.

It is a brave man who undertakes an account of one year's Presidential politics now that the Theodore White has twice brought his practiced hand, considerable resources, and intensive efforts to the

same task. But while Kessel may not write with all the authority of that experienced journalist (who among us does?), the account is smoothly told. The chapters dealing with the pre-convention and convention politics add comparatively little to what we know already. Once the narrative reaches the campaign, the increment over earlier works is more considerable, a result at least in part, one would suspect, of Kessel's position with the Republican national committee in 1964. The description and analyses of the Goldwater campaign will especially be of interest to students of campaign politics, especially the material on the attempts to establish state-wide Republican vote quotas.

But these materials, even though they absorb at least half of the book, are in the nature of background or preliminaries; the book should certainly not be judged in their terms. As its title suggests, the book focuses on the "second level," the study of the Republican strategies of 1964. After lengthy explications of the two Presidential strategies, Kessel examines the impact of the strategies in a long chapter (chapter nine) which is, I think, the most useful and stimulating segment of the book. He draws almost exclusively but effectively on the 1964 data of the Survey Research Center to gauge the impact and effectiveness of the strategies. (I use the plural repeatedly, because Kessel does also evaluate the Johnson strategies, the title notwithstanding.) It enables him to assess the parties' successes with groups they had marked as "target populations," the impact of the campaign over time, the effectiveness of various themes and issues, and the effect of canvassing and other organizational contacts. Even where the conclusions merely buttress what less thorough reports and observations (including our own) have earlier suggested, the information is more refined and precise here. Occasionally, too, it surprises—as in the strong case which Kessel builds that Republican canvassing did indeed apparently increase the Goldwater vote.

Valuable and stimulating as this analysis is, I do have several concerns about it. There is first of all the danger that the "strategies" and "coalitions" we have here and in similar analyses (I think also of the application of formal models) are at least in part the result of the author's own insight and intellectual organization. Do candidates and campaign organizations actually map out such detailed strategies and follow their consequent means-end corrolaries in the heat of the campaign? The day-to-day responses to events, people, resources and contingencies may indeed appear, after the fact, to have been explicit strategy, but it is "strategy" only in a very general, almost truistic sense. My other reservation (and a difficulty which the author recognizes) is over the difficulties in assessing the impact of a campaign with general sample survey data. One can note changes in the electorate over the course of the campaign (when the sample has been interviewed more than once), and one can note distributions of perceptions, attitudes, and preferences in the electorate. But to infer that this or that activity of one candidate or his party caused them is another matter. I am therefore hesitant, without more detailed information about the respondents' perceptions of and exposures to the campaign and non-campaign events and influences, to conclude, *inter alia*, that the 'Goldwater offensive of early to mid-October was having some impact until dramatic foreign events diverted the attention of the electorate" (p. 297).

Finally, on the "third level" this study of strategies in '64 is encased in beginning and concluding chapters which propound a more general theory of parties and politics. The theory—which strikes me as more of a model or paradigm—is built on interlocking concepts of electorate, group, coalition, and institution. "The electorate is a set of persons, potential voters. A group is also a set of persons, a relatively small set of persons who are members of the electorate. A coalition is a set of groups, and an institution is a set of coalitions." (page 323). The concluding chapter is involved with an extended statement of the linkages between attitudes and behavior in each of the four and with linkages between and among them. It serves Kessel as a framework for viewing the events of 1964, although it seemed to me not ot be an essential part of the strategic analysis. Certainly he does not use it extensively as a basis for empirical hypothesis or generalization.

Just how useful the reader will find the electorate-group-coalition-institution framework (even for heuristic purposes) may to a considerable extent depend on his preferred concept of the political party. The bias of the Kessel model is strongly toward a view of the parties which is nonorganizational, and which focuses on electoral coalitions, electoral politics, and voter behavior. It may be that the Kessel approach is partly a consequence of the focus of his present researches and his need to rely heavily on survey data on voting behavior. In any event, my own preferences are for a much more organizational view of the parties, one which recognizes the discontinuity between party and electorate and which does not try to subsume the full range of activity in the electorate into a concept or theory of the political parties.

In brief, this book will be of interest to political scientists chiefly for its additions to the meager systematic literature on political campaigns. Its care and its imaginative use of data, especially the sample survey data, suggests a number of useful ways to integrate the study of political campaigns into the broader literature on American politics.

—FRANK J. SORAUF, *University of Minnesota.*

Democratic Representation: Reapportionment in Law and Politics. By Robert G. Dixon, Jr. (New York: Oxford University Press, 1968. Pp. 654, $8.00).

The Reapportionment Revolution triggered by the Baker v. Carr decision of the U.S. Supreme Court in 1962 has occupied the attention of lawyers, politicians, judges, and scholars since its inception. In the future, it inevitably will receive comparable attention. But it also has raised the left unanswered complex and fundamental questions of representation.

Professor Dixon's book is a rich source of information and ideas for those who seek an understanding of the entire reapportionment issue. It includes the background to the major U.S. Supreme Court decisions in the area, set against historic and continuing problems of representation. It traces the problems of implementing the one man-one vote apportionment standard by courts deeply immersed in Frankfurter's political thicket. It is difficult to think of what Professor Dixon has omitted from this impressive volume, for it covers exhaustively just about every significant issue raised by the Revolution. For example, he discusses the bases for judicial intervention, the problems of establishing judicial standards, and the difficulties of courts applying equal representation standards, both substantively and procedurally, to legislative bodies. He also examines the use of non-legislative apportionment agencies, policy outcome studies, and computer apportionment techniques. He briefly summarizes, in the appendix, legislative apportionment in every state with relevant statistical data for each. In short, the book is complete and thoroughly researched, yet written in a pungent, concise style with a light touch where appropriate.

This is a critical book. There is little that escapes Professor Dixon's criticism. Combining his talents as political scientist and law professor, he draws upon a large volume of research materials which include not only the standard reapportionment works and the contributions of political science to various aspects of reapportionment, but the wealth of legal materials that have accumulated in a comparatively short period of time. Professor Dixon has utilized the law reviews of course, and the opinions of federal and state courts at all levels. But, he also has used to a considerable extent the briefs submitted to various courts by all parties—plaintiffs, defendants, and *amici curiae*. With these tools, and his own research efforts, he analyzes the arguments and actions of almost everyone involved in reapportionment. Few escape his censure—the Supreme Court, other courts, the lawyers' briefs, oral arguments in the courts, political theorists, political scientists, legislatures, non-legislative reapportionment agencies, constitution writers, reformers—all come in for criticism at some point, and, in the logic of Dixon's position, most deserve it. One doesn't agree with Dixon in all respects; but his critiques are well developed and throught-provoking.

If his general argument can be extracted from a volume of immense scope, Professor Dixon agrees that population must be the preeminent standard for representation but feels strongly that key questions of representation have not been settled, nor even raised, by the helter-skelter pattern of compliance with judicial one man-one vote standards. He argues that variant simple standards of mathematical equality hardly confront genuine issues of representation; indeed they permit them to be neatly sidestepped. In his analysis, he raises very real questions of what actually constitutes adequate or effective representation for contemporary democratic society.

Professor Dixon does recognize that apportionment involves essentially political decisions, even within the guidelines of equally populated districts. He stresses that functional inequality in representation may continue to exist, even under a one man-one vote standard, occasioned by the possible impact of varying districting schemes upon particular political situations. He notes the relevance to the measurement of representativeness of gerrymandering, single- and multi-member districting patterns, the geographic concentration of political party strength, and the use of local political boundary lines in districting, among other factors. He argues effectively that reapportionment efforts must accommodate political realities and operate within state constitutional and statutory frameworks which maximize political compromise. To anyone familiar with the endless possibilities of drawing legislative districts or devising apportionment formulae, this is an eminently reasonable position. Professor Dixon properly recognizes that neutral reapportionment is unattainable.

Yet, while he concedes the political nature of reapportionment, Professor Dixon is troubled seriously by judicial treatment of reapportionment cases. He is unhappy with the conduct of the arguments, poorly-prepared briefs, unanswered sallies by the adversaries, the logic of the opinions, the process for remedies fashioned by the courts, and especially the enunciation of simplistic arithmetical standards for equality. He argues that the virtues of swift compliance have been offset by the chaos of disparate judicial and legislative responses to mandates to reapportion.

But the questions of representation which concern him are not easily resolved. Beyond fundamental restructuring of American political sys-

tems, and of American political values, it can be suggested that these issues are not near settlement. They raise basic political questions that American society assiduously has avoided to date. Also, they raise questions upon which there is still very much disagreement. Considering the extent of disagreement and prevailing American values, however mythical in application, it is at least understandable that courts would avoid basic representation issues and confine themselves to simplistic artithmetical considerations, with room to apply them as standards as flexibly as state and local political systems are diverse.

There is much in Dixon's book to argue with because he raises so many appropriate questions. Indeed, this is its merit. His unhappiness with the remaining reapportionment issues is everyone's who has had to confront them. But alas Professor Dixon doesn't resolve them either.—RALPH EISENBERG, *University of Virginia.*

Electioneering in a Democracy: Campaigns for Congress. By DAVID A. LEUTHOLD. (New York: John Wiley & Sons, 1968. Pp. 150. $6.95.)

Congressional campaigns are rather like perennial and abused step-children: largely ignored, under-financed, easily forgotten. Excluding occasional studies of individual efforts, the accumulation of systematic knowledge about political campaigning has, for obvious reasons, been mainly derived from focusing on the presidential struggle. Yet it is not obvious that the characteristic way resources—organization, money, workers, and issues—are acquired and utilized in presidential campaigns is transferable in miniature to congressional contests. Quite the contrary. Following the national conventions, both (perhaps I should say the three or four) presidential aspirants are more often concerned with properly utilizing resources, whereas for all but a handful of congressional candidates, resource acquisition still constitutes an often discouragingly large part of the post-primary campaign. So argues David Leuthold in this compact, empirically-based, cautiously-developed comparative case study of ten Northern California congressional races in the 1962 mid-term elections.

Utilizing the SRC's voter typology to suggest four of the six major resources candidates must acquire, Leuthold is primarily concerned with describing this process as it differentially affects the candidate's vote-getting power. Two of the book's ten chapters focus briefly on the use of these resources, e.g., the kind of appeals undertaken, but the emphasis is on acquisition: What are the personal characteristics that distinguish winners from losers? Incumbents from nonincumbents? How is the support of prominent party leaders gained and held? What are the major information sources candidates use to inform themselves about voters? About issues? How is the support of non-party groups obtained? What are the major sources of campaign funds? How are campaign workers recruited and motivated? How do they perceive the candidate? The campaign?

By examining a relatively small number of candidates (20) in districts clustering around the San Francisco Bay region, the author was able to employ a variety of research techniques and collect data from a variety of sources (personal interviews with the candidates and key campaign personnel, observation of candidates before meetings and at party gatherings, responses by campaign workers to a two-page questionnaire, financial reports submitted to the California Secretary of State, etc.) Leuthold, however, omits any serious discussion of the reliability of these multiple information sources and it is thus not clear, for example, how much emphasis was placed on the candidate interviews, or even what questions were asked, or what criteria were used in selecting and observing (or not observing) "campaign events." Since it was neither feasible nor essential that he cover all the races in equal detail (the book is a revised dissertation and most of his illustrative materials come from two of the ten campaigns), a brief discussion of these factors would have been helpful.

The most consistent finding, hardly surprising but patiently if not laboriously documented, it that inequalities in the distribution of campaign resources are not dispersed; not even modestly so. Incumbents of both parties are enormously advantaged by the cumulative nature of campaign resources, whether it involves comparatively incidental factors like family support, or more substantial matters like financing, gaining group support, controlling and manipulating information about issues, or developing a stable and effective campaign organization. One pathetic challenger greeted a mid-summer volunteer by saying, "Congratulations, you're the first to volunteer so you're the campaign manager." The only campaigns in which this pattern is even vaguely disturbed were in the three districts which could be classified as competitive, one of which had no incumbent running. Nevertheless, even in competitive districts the distribution is greatly skewed toward incumbents.

But the assumption cherished by most professional politicos, that by simply equalizing some resources, e.g., money, a campaign organization can convert these resources into votes, does not follow. Although one hazards to use 1968 as an example, the three million dollars reportedly raised and distributed by the Republican Congressional Campaign Committee to 81 "target" districts was not conspicuous for its success and these were districts most likely to be vulnerable. Moreover, as Leuthold notes in passing and as Nelson Polsby

has forcefully argued, there are some demonstrable advantages in the historically decreasing turnover of personnel in the House (for both liberals and conservatives), advantages which would presumably disappear if that stability were threatened by increasing competition. Since Leuthold adopts Schumpeter's criteria of "democracy"—with its excessive emphasis on the mechanics of a competitive struggle over votes—he does not seriously consider what alternative functions are performed by the structure of defeat and the resulting existence of a guaranteed opposition in the House no matter how strongly electoral tides are moving in one or the other direction.

The author does show, on a variety of dimensions, that citizen participation increases in competitive districts, and ends his study by suggesting a number of reforms which would partially, if not increase electoral competition, help to disperse resources more equitably than is not the case, a necessary but not sufficient condition for meaningful competitiveness. Most have been suggested before (direct subsidies to challengers and their staffs, permitting candidates to compete simultaneously for two offices), others are relatively new and would require a revolution in the present habits of state legislators and federal judges (substituting competitiveness for compactness as a criteria for redistricting). Leuthold recognizes the dismal prospect for most of these proposals when with admirable and, one hopes, intentional irony he comments, "Some of these suggestions, especially the suggestion that congressmen vote campaign salaries to their challengers, are not likely to be adopted immediately . . ."

The chief strength of this study, however, resides in the careful manner in which descriptive materials are marshalled around the central question of resource acquisition, independent of whatever policy recommendations might be drawn from the findings. Regrettably, the small number of campaigns, while more adequate than traditional intensive case studies, does not really permit any solidly based generalizations. The book is loaded with tendency statements ("Democrats who worked in primary elections were found to be more liberal than Democrats who worked only in the general election," (p. 37), or ". . . experienced candidates were more likely to emphasize the Burkean notion of independent trusteeship, while inexperienced candidates thought of a congressman's role as that of an instructed delegate," (p. 115) which would have profited by noting exactly how many—3 of 10? 5 of 10? 8 of 10? Some other minor problems: The author's disciplined caution occasionally lapses into dissertation-like timidity—"In the Bay area, mail appeared to be more valuable for congressmen than for nonincumbents as a source of information about voter attitudes," or, "Most people would consider democracy weakened if the House of Representatives were to be appointed by the President, as is the Supreme Court." But these are quibbles. The book constitutes a welcome addition to what one hopes will be a research renaissance on congressional campaigns, elections and recruitment.—JEFF FISHEL, *American University.*

The Shrine of Party: Congressional Voting Behavior, 1841–1852. By JOEL H. SILBEY (Pittsburgh: University of Pittsburgh Press, 1967. Pp. 292. $6.00.)

This study of voting in the House and Senate from 1841 to 1852 is of interest to political scientists on at least two grounds. Substantively, Silbey reveals a good deal about the relative strength of party and section during the 1840s. His analysis adds strong support to the thesis advanced by Richard P. McCormick in *The Second American Party System* that by 1840 two national parties had developed as highly organized institutions competing on substantially equal terms throughout all the major regions of the country. McCormick's study is a description of party formation in the various states; it ends in 1840. Silbey's study begins in 1841 and is an analysis of rolls calls in both houses of Congress.

Contrary to the views of some historians, Silbey finds that in the 1840s voting in Congress was marked by a rather high degree of cohesion within both the Whig Party and the Democratic Party, marked differences in the voting patterns of the two parties, and low cohesion among representatives from the major sections of the country. If Congress was polarized, in the 1840s the polarization was of parties, not of regions.

The situation was, of course, more complex than this. Voting along party lines that cut across sectional boundaries was more characteristic of the early than the late '40s. The Whigs regularly supported proposals for a national bank, tariff protection, and appropriations for rivers, harbors, canals and other "internal improvements." The Democrats regularly opposed these objectives. The Democrats were expansionist and agressive in foreign affairs; they sought new lands into which free farmers and slave owners could move as they exhausted the old. The Whigs were more cautious in foreign affairs and more likely to oppose expansionist schemes.

The voting patterns of the two parties seemed to reflect two conflicting and yet internally coherent ideological perspectives, each designed to appeal, though in different ways, to the major economic, social, and regional interests of the country. To the Whigs, economic and social progress required the mutual development of agriculture, commerce, finance, and industry under the benign

regulation of the federal government: the Whigs were Hamiltonians. The Democrats, more Jeffersonian, sought to reduce the rule of government to the barest minimum because laissez faire was the best guarantee of freedom and prosperity, so they thought, in a nation of farmers, particularly since the income of farmers in the South and West depended on international markets.

Even if hindsight tempts one to over-interpret the strains of sectionalism (Silbey suggests that many historians have wrongly read the controversies of the late '50s into the '40s) there were nonetheless serious stresses within the parties. Western farmers needed appropriations for improvements in transportation in order to market their produce; Southerners did not, and feared that federal appropriations for roads and harbors would have to be paid for by higher tariffs. Thus on this issue, the South and the West had irreconcilable goals. John C. Calhoun never quite succeeded in getting Southern Democrats to support the West on internal improvements as a price for support by Western Democrats on issues involving slavery.

Slavery, of course, was the major sectional issue that threatened the unity of both parties. Whenever the issue of slavery expansion came up—and in the second half of the decade it could no longer be avoided—the party coalitions tended to fall apart and on this question voting assumed a markedly regional pattern. Possibly because of this, by the end of the decade the parties ceased to have the internal cohesion they previously had shown on other issues.

However, as Silbey shows, the decline of party cohesion did not mean that Congress was polarized into sectional blocs. Instead, "Congressional voting had broken down, more than ever before, into a multiplicity of factional groups, behavioral factors, and individual decision-makers, with only occasional alignments of these patterns into large-scale partisan or sectional groupings." An unpublished study of House roll calls in the 1850s by Donald Forbes and myself indicates that this unpolarized pattern of multiple, cross-cutting cleavages persisted throughout most of the '50s, except for a brief polarization into sectional blocs, during the dispute over Kansas in the 34th Congress (1855–6). Finally, to be sure, the long heralded, fearfully sudden, and virtually complete polarization into two regional blocs dominated the Congress in 1859-60 and terminated in civil war.

Silbey's study is interesting not only for its historical findings but also because of its methodology. If Lee Benson, Samuel P. Hays, Allan Bogue and a few other historians were the first generation of pioneers in the use of modern quantitative methods in political history, Joel Silbey can be said to be of the second generation. Silbey is probably the first historian to analyse a decade of Congressional roll calls in the nineteenth century by means of scaling techniques. The results seem to me fruitful, and we may expect that Silbey's generation of historians (aided perhaps by an occasional political scientist) will ultimately provide us with similar analyses of voting in Congress for its entire history.

In the application of quantitative methods to the study of history, that discipline is about where political science was less than two decades ago. Social and political historians trained in quantitative methods are few in number, predominantly young, and confronted by colleagues whose mood seems to be shifting from hostility to resignation, healthy skepticism, and even encouragement. Although large parts of the study of history may never lend themselves to quantitative methods, historians who use such methods skillfully are bound to have a significant effect on the discipline during the next several decades.—ROBERT A. DAHL, *Yale University.*

ESEA: The Office of Education Administers a Law. BY STEPHEN K. BAILEY AND EDITH K. MOSHER. (Syracuse: The Syracuse University Press, 1968. Pp. 393. $10.00.)

"This is a study in public administration." These, the first words of Professors Bailey and Mosher in this exhaustive study of the Office of Education (USOE) and the Elementary and Secondary Education Act of 1965 (ESEA), are wholly accurate but unduly modest. The book can be more accurately categorized as a study of public administration as an integral part of the political process. Such an approach is certainly not new, for we have been graced with the expanding literature of the Inter-University Case Program for nearly two decades (Professor Bailey having recently published a short ICP study on ESEA) and several general and theoretically directed works by Hyneman and Woll along with a few recently published anthologies with bureaucratic politics as their main focus. However, the Bailey and Mosher work is distinctive due to its analysis in depth of one situation involving a single administrative agency, its balance of focus on ESEA's pre-natal and post-natal history, and its careful mixture of descriptive-causal analysis with normative-prescriptive material. The fact that no study of such dimensions has yet appeared can be explained, in part, by the fact that only in recent years has the study of administration and politics developed the requisite maturity and depth of interest in the systematic measurement of revolutionary legislation on an administrative agency to make such investigations worthwhile.

Since it is likely that most students of public policy accept federal involvement in local education matters as a fact of life, most were not quick

to recognize the adjustment crisis which ESEA caused for both USOE and for state and local school administrators. In consciously linking a sound educational system to the eradication of poverty, the law directed that most funds for elementary and secondary education be funnelled to school districts with high percentages of culturally and economically deprived children. Other sections provided funds for books and related instructional materials, for new experimental education centers, and for university and individual research projects.

Such challenges fostered much anxiety, frustration, and conflict within USOE and between USOE and external organizations affected by the law. The status quo is, due to both apathy and a natural fear of the unknown, preferred by many to the uncertainties and insecurity which could result from such sweeping changes in an agency's mission. The pre-ESEA period found USOE in an "old-line" status, characterized by hyper-specialization, a disjointed and irrational organizational structure, estrangement from its parent department (HEW), and gun-shyness due to constant bombardment by opponents of federal aid to education. ESEA necessitated more organizational integration, new blood at all levels and ranks, and a modernization of agency financial and management procedures. External conflict was met with a very intricate "give and take" between USOE and affected school officials, church spokesmen, and concerned interest groups, with USOE personnel demonstrating deplomacy and flexibility in adjusting programs to the administrative-political facts of life. Still, opposition from state and local school administrators was quite troublesome. USOE's insistence upon school desegregation as a prerequisite for program participation, its overly bureaucratic approach, and the timing for releasing funds all caused constant intergovernmental strain. While USOE officials expressed satisfaction over the first year's administrative record (to mid-June, 1966), the authors note that such self-defined success cannot be accurately assessed as yet.

While the book is strong on descriptive and causal analysis of ESEA's origin and early administration, it is equally strong on the analysis of both the adequacies and shortcomings of federal aid to education as it has evolved within the American political system. In reviewing a century of federal concern for education the authors conclude that, while today we are more able to appreciate the philosophical, political, religious, economic, and administrative problems associated with federal aid, we have failed to deal adequately with the important questions of proper public-parochial relations (basically because of the constitutional "limbo of uncertainty"), school desegregation, interagency administrative coordination, and with the relatively new challenge of tailoring educational policy to the needs of the poor. Striking a more positive note, they speak of how the case illustrates that an administrative agency can champion retionalist policies while remaining politically responsible. They cite how both advocates and critics of federal aid can take comfort from the ESEA story because the "administrative apparatus of a separation of powers, Federal, and politically diffuse polity, is too cumbersome for tyranny; too interdependent for anarchy." They note that "the bargaining processes of public administration" in the long run conform to prevailing social norms. This, they say, "makes reformers restive; but it also disturbs the satisfied from their callous slumbers." In graphically illustrating the "kaleidoscope of policy-making," ESEA was directed at mediating between opponents and proponents of federal aid "without unduly blunting the edge of true innovation . . . The real tailor was the bargaining processes of a domocratic polity shaped here and there by the unusual skills of a few cutters and seamstresses sensitive to emerging fashion."

There is, to be sure, abundant gloss to the book's style, especially when analysis is the major focus. But it is, above all, a very lucidly written work that calls for such expressive terminology to relate the honest assessment of the authors. In short, I find its style, depth, organization, and balance very appealing. Granted, it is a study of the experiences of one agency with an unusual challenge operating in an atypical political environment and, to that extent, it is not representative of the ledger of a typical agency with a routine mission. Yet the abnormalities of the situation help to underscore than amplify the intricacies of the American political system and enable the reader to appreciate the almost infinite complexities of the system, and to acquire an appreciation for the constant tug-of-war between administrative rationalism and political realism.

As a devotee of the case study as a teaching device, I must confess to a methodological bias on my part. I am also compelled to publicize my awareness of the tendency for some case study authors to become captivated by and overly appreciative of the system under study. While acknowledging the possibility that there may be some of this here, my feeling is that it is minimal if it exists at all. The book's major thesis is unquestionably valid and its contents true to its thesis. The unavoidable interdependence of politics and administration is portrayed with all its complexity, intrigue, confusion, and frustration. Students of public administration, legislation, public policy, and politics will undoubtedly argue as to whether the implications of this study give cause for optimism or pessimism. But let no one finish this book and argue against the thesis that the study

of public administration, politics, and political theory are logically separate fields of inquiry. This book will serve many purposes for many political scientists, but above all it illustrates the inevitable interconnection of these areas, and it illustrates it very well.—WILLIAM L. MORROW, *DePauw University.*

Constitutional Politics in the Progressive Era: Child Labor and the Law. BY STEPHEN B. WOOD. (Chicago: The University of Chicago Press, 1968. Pp. 320. $10.00.)

Stephen Wood's *Constitutional Politics in the Progressive Era* is an extended, but incomplete, historical account of two episodes in the movement to regulate child labor by national legislation, the first culminating in *Hammer v. Dagenhart* (1918), barring the use of the commerce power for such purposes, the second ending in *Bailey v. Drexel* (1922) when the Supreme Court blocked a parallel effort based on the tax power. Wood presents a fuller study of some of the interest groups and individuals involved in these episodes than we have yet received. His work is nevertheless incomplete in at least the following respects: For reasons not made clear in the book, the research effort terminates with the Supreme Court's *Bailey* decision holding the child labor tax of 1919 unconstitutional. While reference is made to the *Darby* decision of 1941 upholding the child labor provisions of the Fair Labor Standards Act, no effort is made to trace the legislative and judicial developments which led to this result. In addition, the volume leaves unexplained and unexplored the remarkable ineptitude, mismanagement or opposition to both child labor laws glimpsed in the account of the Justice Department's direction of the child labor cases through the courts. There are sharp studies of the counsel for the opponents of the legislation and of the egregious district court judge before whom both laws began their ill-fated adventures in the federal courts. There is near silence on the roles played by Solicitor General John W. Davis in the Dagenhart case and by Solicitor General James M. Beck in the Bailey case. Surely these apostles of limited government, the latter of whom could speak of the "perversion of federal powers" likely to result if the judiciary refused to inquire into the motives behind Congressional enactments, deserve as much attention as is given to James M. Emery, the brilliant and skillful general counsel of the National Association of Manufacturers, who supplied both direction and content to the first campaign of opposition to federal regulation of child labor.

It may well be that Wood conceives of his work as an intensive examination of one theme in the Progressive movement. If this is so, the work must be taxed for its complete neglect of the historiography of progressivism. Wood uses a simplistic dichotomy between "liberals" and "conservatives" as his fundamental classification of participants in the events he describes, going so far as to write without qualification of Justice Holmes as a "liberal," despite all the critical attention this old, if not hoary, chestnut has been given. He confounds, by unquestioning inattention, the designation of a political era (Progressivism) with a specific goal-orientation in politics (progressivism), thereby lightening his scholarly burden to the point where he can dismiss President Wilson's nomination of James C. McReynolds to the Supreme Court as a "mistake," without inquiring whether this phenomenon of Progressivism, like the presence of John W. Davis as Solicitor General in 1917, does not suggest a disjunction if not indeed an opposition between the Progressive Era and that policy of support for the needs of the depressed and disadvantaged designated as progressivism.

These reservations about the acuity of Wood's scholarly perceptions are unhappily reinforced by one of his more explicit methodological assumptions. He states that in using biographical data as sources of insight into the doctrinal positions of the justices he discusses, he will make inferences "only where what we know about factors influencing selection or explanatory of behavior appear to justify conclusions that transcend speculation" (118). What factors these are which are explanatory of behavior and yet transcend speculation does not appear from the impressionistic and fragmentary sketches Wood presents. The characterization of Justices Holmes, Brandeis, and Clarke as liberals is one result of this unspeculative method: Holmes and Brandeis voted, without separate opinions, in the eight-man majority that struck down the child labor tax; Clarke dissented in the same case, also without a written opinion. In this circumstance the characterization is a model of speculation unsupported by what "we know" of the rules of evidence and analytical reasoning. Wood writes as if he believes his documentary sources are so rich and so unambiguous in meaning that careful evaluation is unnecessary, a belief which would be folly in historians and a complete abdication of scholarly responsibility in political scientists.

One chapter of Wood's book is of a different order and demands special notice. "Judge and Company: Raising the Test Case," is an excellent study of the strategy and tactics of constitutional adjudication. Wood uses his sources—expecially the files of the National Child Labor Committee, and of the Department of Justice—to reconstruct the selection of the test case and the arrangement of an essentially friendly suit to test the constitutionality of the Keating-Owen Act. Effective re-

sort to biographical data results in a detailed portrait of Judge James E. Boyd, the federal judge who presided in the case. The resulting trial and decision is at once a tribute to the skill with which opponents of the legislation sought to determine the outcome by control of "the issue, the judge, the particular circumstances and even the parties," (93) and a searching illumination of the extraordinary powers exercised by individual district court judges before the reforms of 1937 restricted them by requiring three-judge courts to sit in suits seeking injunctionive relief against allegedly unconstitutional Congressional acts. In the best sense of the phrase, this is "writing for the anthologies."

The contrast between this chapter and the remainder of the book is striking. The role of relevant groups, like the women's rights organizations, is minimized or ignored. Case analysis is pedestrian, painfully so when a footnote reference to T. R. Powell reminds us of five pages in which there is a sharper examination of the issues than in an equivalent number of chapters by Wood. Finally, an infelicity of expression is regrettably a fair indicator of the book's content. We read of "the Supreme Court's power of invalidity," (300) and find as a last paragraph the following lines, fully appropriate to support a negative assessment, but out of place as the last words in a scholarly endeavor:

> It is a commonplace of constitutional commentary to assert the controlling place of popularly determined policies in American democracy. However, the child labor history instructs—if nothing else—the vulnerability of this principle when conflict exists, as it almost always does, over "the extent of powers actually granted" Congress and over the purposes that government can legitimately pursue, whether the achievement of social welfare or the effectuation of equality.

[sic].—Leo Weinstein, *Smith College.*

Negroes, Ballots and Judges: National Voting Rights Legislation in the Federal Courts. By Donald S. Strong. (Alabama: University of Alabama Press, 1968. Pp. 100. $5.00.)

If the primary purpose of the Civil Rights Acts of 1957 and 1960 was to enfranchise Negro citizens in the South, the efforts were futile. Donald Strong traces the attempts at implementing these laws through federal court action, and arrives at this conclusion.

The book is excellent as a reference source, both for the previously uncollected data and for the behavioral insights into legal processes in the area of Negro voting in the South. It includes a short summary of the 1957 and 1960 Acts, and that portion of the 1964 Bill relating to voting. Then comes an account of various instances of *official* discrimination which the federal government tried to resolve by suits. Firing of teachers involved in registration attempts, arrest, threats, actual beatings by sheriffs and deputies, and public harassment were among coercive devices employed. Registrars discriminated blantantly in literacy tests, and purges were conducted. Sheriffs refused to allow Negroes to pay their poll taxes. The Justice Department sought, and sometimes obtained, relief through cases on a county-by-county basis. Later, suits were filed against the entire states of Mississippi, Alabama, and Louisiana, claiming that the state laws were discriminatory *per se.*

There are few errors of commission in Strong's work; the author's shortcomings lie in the restrictive approach employed, and in the limited nature of his sources. He relies heavily on *Race Relations Law Reporter,* and largely ignores hearings and reports of the U.S. Commission on Civil Rights, and numerous theses and dissertations on the subject. This causes him to omit reference to the coercion and intimidation which was heavily documented in these sources.

The other major section of the book, by far the best and most useful portion, deals with the problem of enforcement. Sometimes state legislatures, chiefly those of Alabama and Mississippi, tried to circumvent the federal acts by various methods—a sort of gamesmanship.

The other hindrance to enforcement was in the behavior of federal judges who openly professed to believe in segregation, and saw themselves as protectors of the White South. This superior section reveals the enormous role that these judges had in retarding or accelerating Negro enfranchisement. The author places on these men a major portion of the burden for failure of the 1957 and 1960 Acts, and the transfer of the responsibility from the judiciary to the executive branch in the resultant 1965 Voting Rights Act.

In this section, Strong's limited sources cause considerable error. He is hampered, as are all researchers in the field of Federal law, by the highly selective process by which Federal district court cases are included in the *Federal Supplement.* Less than twenty per cent of these opinions handed down are printed here. The rest are mimeographed or typed, and filed with clerks in various offices in each judge's district. Thus accurate quantitative research is extremely difficult.

For example, the author states that "Claude F. Clayton, the judge of the Northern District of Mississippi, appears to have handled only three cases in this area. Judge Clayton has a perfect record of ruling against the (Federal) Government—three to nothing." I was able to locate eleven cases against Mississippi officials; Clayton ruled for the federal government in eight of the eleven cases, and for state officials in only three cases—those listed by the author. Further, Clayton's language in these eight opinions was so strong that registrars were quite certain that harsh penalties

would follow if they persisted in discriminatory practices. (The one registrar who tried was cited for contempt.) Similar errors concerning other judges are highly probable.

The author also ignores the role of the Court of Appeals of the Fifth Circuit in implementing the Civil Rights Acts. With a large part, possibly a majority, of these nine appellate judges being staunch segregationists, Chief Judge Elbert Tuttle had to carefully manipulate assignments to the three-judge courts on crucial cases. When his judgment failed, so did the efforts of the Federal Government.

The epilogue, a four-page comparison of the results of the 1965 Voting Rights Act with the previous efforts, is emphatic, but somewhat lacking. The author's premises that the older Acts were failures, and the 1965 Bill a success, are easily amenable to empirical testing. Negro registration *has* grown, largely as a result of the bill. This should have been documented more fully, and would have been a more credible put-down for those who contended Negroes did not register and vote because "they just don't care."—STEVE WHITAKER, *Temple University.*

The Jurisprudence of John Marshall. BY ROBERT K. FAULKNER. (Princeton: Princeton University Press, 1968. Pp. 307. $10.00.)

The story (apocryphal?) is told that when John Marshall was Chief Justice (1801-1835) he would, on many a judicial occasion, turn to Story (Mr. Justice) and say: "This is the law, now find the precedents for it." A century later, in participating in a celebration of Marshall's accession to the Chief Justiceship, Oliver Wendell Holmes (then on the bench of the Supreme Judicial Court of Massachusetts) noted that ". . . If American law were to be represented by a single figure, sceptic and worshipper alike would agree without dispute that the figure would be one alone, and that one, John Marshall. The former statement obviously implies that if Marshall was indeed a great Chief Justice it was merely because he happened to preside over a Court that was writing large segments of the law of the land. The latter statement just as obviously implies that Marshall's individual contributions to American jurisprudence, as revealed in his opinions, justify the accolade expressed.

The beauty of Robert K. Faulkner's *The Jurisprudence of John Marshall* is that he does more than develop these two possible interpretations. He does even more than merely set his goal toward some kind of reconciliation of Marshall the statesman and Marshall the jurist. What he has done is to create a study in depth "of one comprehensive political, economic, and legal persuasion by which the Constitution is to be interpreted" and through that study to explore and set forth Marshall's jurisprudence. On one level that "jurisprudence revolved about the Constitution of the United States as understood at its framing, varied somewhat with great events and changing conditions in America, and encompassed practical skills in application as well as knowledge of the broad principles of American law." As such it might be said to be an early form of American pragmatism so vitally necessary in building a new nation and hence not a system of philosophic jurisprudence in the sense that "detailed prescriptions for the problems of our times" (today) can be extrapolated. But it is Professor Faulkner's worthy contribution to add to this generally accepted denominator a new value: and that is that Marshall developed "a Lockean interpretation of liberty and law which is separated from neither moral considerations nor a certain kind of political wisdom, and takes into account, moreover, America's peculiar conditions." Thus on a much higher and worthwhile level Marshall seemingly founded a legal philosophy that makes American law, American political thought, and American history an entity in its own right.

To achieve this end, and to achieve it with the distinction that Professor Faulkner gives to it, would seemingly be an insurmountable task. For one, it was necessary to avoid producing just another treatise on American Constitutional Law. For another, the facts about Marshall have already produced such a vast literature that one might instinctively say what more can be added. For still another, Marshall's own writings, aside from his judicial decisions, are either missing, scattered, or dull—and the mere fact, for example, that Professor Faulkner has mined the volumes of Marshall's *Life of Washington* merits high praise in and of itself.

Despite these obstacles Professor Faulkner has produced a most stimulating, thought provoking, and readable book which at one and the same time uses all that is known to add a new dimension about Marshall himself as well as about the American legal system and the society it is meant to serve. With real ingenuity Professor Faulkner has in reality written six essays (four in the text itself and two as appendixes)—each an important study in its own right—bound together by an era and a man. Instead of using the Constitution as text and analyzing Marshall's concept of say the commerce clause or the contract clause or whatever, we have here a bolder and more difficult undertaking: how did Marshall (and his era) conceive of such things as "Liberty, Interest, and Empire"; of Sovereign Government"; of "The Republic"; of "The Court and The Constitution"; and how did he instill them into the marrow of America while performing his task as Chief Justice participating in the task of expounding the Con-

stitution as a legal and political document for a new nation. In the final analysis the values inherent in making these concepts meaningful are the enduring ones. They are the ones by which a people must live and be known. For any text, even a Constitution, can seemingly shift its emphasis as time dictates, as witnessed, for example, by the diminution of the contract clause in the wake of due process and equal protection. And it is through his development of these values in these areas that Marshall created his jurisprudence.

Yet Professor Faulkner is obviously too competent a scholar to present Marshall's jurisprudence in historical perspective alone as based on Locke and "natural rights". He recognizes that Marshall is now conceived to be the "older jurisprudence" and as a leitmotif (Appendix) examines its replacement: ". . . the assertion of social expediency as the standard of judicial decision, the doctrine of judicial deference, the change from the primacy of property rights to that of free speech, the rise of moral skepticism, sociological jurisprudence, legal realism, and many other things now widely taken for granted"—a "Holmesian victory" as he calls it. His analytical study of both Holmes and Marshall transcends a mere plaintiff appeal not to downgrade John Marshall. It is rather a plea for a greater understanding and comprehension that "the most fundamental concerns of the American order" must by founded, if they are to be dealt with in a manner that will endure, on a "moral, political, and legal philosophy," for it is only by a deep rooted philosophy that America's "purposes, its character, even its institutions" can be saved from "aimlessness and degradation."

And no better place can be found for such a reexamination and reappraisal than in Robert Faulkner's *The Jurisprudence of John Marshall.*—BENJAMIN MUNN ZIEGLER, *Amherst College.*

The Politics of Mental Health: Organizing Community Mental Health in Metropolitan Areas. BY ROBERT H. CONNERY *et al.* (New York: Columbia University Press, 1968. Pp. 595. $10.00.)

The Politics of Mental Health is a study of problems concerning the implementation of the Mental Retardation Facilities and Community Mental Health Centers Construction Act of 1963. Supported by a grant from the National Institute of Mental Health, the study developed from discussions in NIMH's Committee on Social and Environmental Variables as Determinants of Mental Health. It reflects a growing interest among mental health specialists in social and community conditions of mental health. (For one student's satirical treatment of community mental health see *Transaction,* July-August, 1968.) The book includes separately authored case studies by local academic observers in Houston, Seattle, New Orleans, Syracuse, Boston, and Minneapolis-St. Paul. Analysis is based on data from published reports, records, and interviews with local observers and participants. Most of the data were collected in 1963-1964.

The Politics of Mental Health is partly a guide to community mental health action and partly an analysis of such action. As a guide to community mental health action, and to the implementation of the 1963 act, the book is an interesting discussion of obstacles and problems, and ways to overcome obstacles and problems. The Houston, Seattle, and Minneapolis-St. Paul studies seemed especially interesting to this reviewer. One of the main obstacles considered in the book is governmental fragmentation; but others are also considered. For example, difficulties in defining "mental health" and "community" are described. Also described are (1) problems stemming from the scattering of mental health functions among federal, state, and local governments (2) the splintering of mental health functions among several agencies at the same governmental level (3) problems of community financing and staffing and (4) the impact of community power structures. As a discussion of obstacles and ways to overcome them, *The Politics of Mental Health* should be a source of helpful ideas for mental health activists in other cities.

As an analysis of community action, however, the book has several shortcomings. The persons interviewed are not specified, and the nature of the data collected in the interviews is often unclear. With their data, and other evidence available to them, the researchers are forced to make logical guesses, plausible assumptions, and "stopgap assessments" about the impact of various factors, combined or separately, on the implementation of the 1963 act. No quantitative analysis is presented, and the book is not put in a broad theoretical context. No common research design is used in the case studies, although similar questions are pursued. None of the many models of community action analysis, or policy analysis—such as those used by Paul A. Miller, Delbert C. Miller, Kaufman, Banfield, Green and Mayo, or Dye—are used, or even mentioned. Mention is made, however, of professional, community, and federal "inputs" and of the impact of community environments on mental health. But variables affecting local mental health action are not systematically classified as political system and environmental variables, mental health system and non-mental health system variables, or community and extra-community variables. The findings are not systematically compared with other findings on community action, urban policy, or governmental fragmentation. Few recent studies by political scientists are discussed or even cited. In the six sum-

mary chapters only seven studies published later than 1964 are cited. None of the seven studies are by political scientists, and none were published later than 1966.

The senior author's preface claims only that *The Politics of Mental Health* should be valuable to mental health administrators and political leaders who must deal with mental health problems in their communities. I agree with this statement of its value. It should sensitize mental health activists to practical obstacles to the achievement of their goals. If it does *The Politics of Mental Health* will make an important contribution to community mental health action. Activists in other fields have often proceeded on the assumption that the only thing needed to achieve their goals was to publish a meritorious, above-politics plan and sit back while the plan sold itself.—BRETT W. HAWKINS, *University of Georgia.*

The Warren Court & Its Critics. By CLIFFORD M. LYTLE. (Tucson: University of Arizona Press, 1968. Pp. 233. $5.00.)

Clifford Lytle's goal is "to bring a degree of analytical order" to the criticisms which have been levied against the Supreme Court and "to project the attacks . . . into a manageable framework so that they may be better understood." (p. xi) His study spans a period beginning with the School Segregation Cases in 1954 and ending with the Miranda Case in 1966. Attention is given to the attacks on the Court engendered by its decisions in the areas of race relations, church-state separation, legislative apportionment, national security and rights of defendants.

Lytle's framework distinguishes two aspects of the attacks on the Court: the sources of criticism and the nature or rationale of the criticism. To begin with the latter, Lytle recognizes four bases for attacks on the Court. These are discordant social philosophy, intra-governmental conflict, decisional obstruction, and the operation of the judicial process. The first three categories are dubbed "result-oriented" criticisms and the last is viewed as "process-oriented" criticism.

One is hard pressed to find in Lytle's discussion the criteria which distinguish clearly the three categories of result-oriented criticism. The category of "discordant social philosophy" is, for instance, defined as embracing "ideological dissent which involves economic, political sociological and psychological differences." (p. 3) But it seems obvious that the "intra-governmental conflict" category involves ideological differences on a political matter, the proper distribution of authority between the branches of the national government and between the national government and the states. Similarly, the distinction between the "intra-governmental conflict" and "decisional obstruction" categories is unclear. The latter focuses "not so much on a positive struggle for power as on elimination of a 'functional obstruction.' This type of attack generally stems from those governmental agencies which have been hindered in the full and free exercise of their functions as a result of certain Supreme Court decisions." (p. 4) It is unclear whether the Court's 14th Amendment defendant's rights cases fall into this category or into the "intra-governmental conflict" category inasmuch as they impose restrictions on the "full and free exercise" of state executive and judicial functions while also pitting federal judicial power against state authority.

Lytle categorizes the sources of criticism as the Congress, interest groups, state government agencies, state and federal law enforcement agencies, and professional groups and their members. In the latter category he includes judges and academicians as well as bar associations. An important omission in his list of critics is the public. There are not available a substantial body of survey data and a number of excellent scholarly writings on the public's attitude toward the Supreme Court. These suggest some discrimination by at least the attentive public between the defendant's rights cases and School Prayer Cases, which tend to be disapproved, and the race relations and reapportionment cases, which tend to have at least majority support. The public's role as a critic of the Supreme Court ought not to be overlooked in a volume of this kind, both because of the implications for legislative efforts to curb the Court and the implications for the question raised by Dahl and other political scientists about the Court's proper role in a democratic society.

Even readers, such as this reviewer, who strongly favor the recent directions in Supreme Court policy-making will be disturbed by Lytle's treatment of the Court's critics. Lytle time and again dismisses criticism of the Court as "irrational" or "politically motivated" or "emotional" or "shallow" or "not judicially presented." In introductory and concluding sections of the book, he suggests that criticism may play an important role in the political process. (pp. 5, 111) But nowhere does he articulate the criteria which distinguish such valuable criticism from that which is to be viewed as unworthy, thus leaving the reader confused about how the author arrived at his judgements.

At some points the author runs afoul of his own rhetoric. He severely rebukes the Southern critics of the Court for "guilt-by-association" tactics because they attempt to link the Court to left-wing groups and viewpoints, particularly in the race relations cases. (pp. 16–17, 95) Elsewhere, however, admittedly reputable critics of the Court are chastized by associating them with the most reckless

of the Court's opponents. Thus the action of the ABA's House of Delegates in adopting in 1959 resolutions critical of the Court's decisions in the national security area was "entirely proper" when "taken out of context" but must nonetheless be condemned because "the timing . . . all but nullified the good intentions" and "contributed an air of legitimacy not only to the well-intended critics of the Court, but also to those who had made reckless attacks." (p. 99)

Despite the disagreements between this reviewer and Lytle at a number of points cited above, it must be noted that Lytle's volume is well written and very well researched. It provides an excellent commentary on the development of controversial lines of cases and the responses of some of the critics. This will be helpful to teachers of civil liberties, including this one. Such a use is, however, limited by the weaknesses in the conceptual framework, the organization and the objectivity of the presentation.—DAVID ADAMANY, *Wesleyan University.*

Double Jeopardy and the Federal System. BY LEONARD G. MILLER. (Chicago: University of Chicago Press, 1968, Pp. 152. $9.75.)

In United States v. Lanza, Chief Justice Taft, speaking for a unanimous Supreme Court, upheld the federal prosecution of defendants who had already been convicted by a state court for the same acts charged in the federal indictment. Although no justice had dissented in the case, J. A. C. Grant launched a vigorous attack upon the decision and the dual sovereignty rule which underlay it. Thirty-seven years later, in 1959, the Supreme Court reexamined the dual sovereignty rule in Abbate v. United States and Bartkus v. Illinois. The Court, through Justice Frankfurter in Bartkus and Justice Brennan in Abbate, affirmed the Lanza doctrine but this time Justice Black, joined by the Chief Justice and Justice Douglas, dissented. Unconvinced by the majority, Walter T. Fisher, counsel for Bartkus, continued his arguments in the law reviews. Now Leonard G. Miller has joined the debate.

Double Jeopardy and the Federal System is a defense of the dual sovereignty rule and in a sense it is also a detailed rebuttal to J. A. C. Grant's attack, the Black dissents, and some of Fisher's arguments. Since the author focusses upon the dual sovereignty rule, he does not explore the intricacies of double jeopardy *per se* but rather only those special possibilities of successive prosecutions which arise from the federal system. Professor Miller agrees with the results in Abbate and Bartkus because they rest upon a "110 year old formulation." Indeed the decisions were an obvious response to considerations of *"stare decisis,* judicial self-restraint, effective law enforcement and the pre-requisites of federalism." In support of these conclusions the author devotes the major part of his book to tracing the origins and history of the dual sovereignty rule in judicial adjudication and to analyzing the Bartkus and Abbate cases.

The dual sovereignty rule, he concedes, does not by any means ensure just results in every case yet, assuming the value of punishing the guilty to be as great as that of freeing the innocent, less injustice will arise from retention of the rule than from its rejection. In earlier cases courts have exercised their education function to mention the possibilities of injustice and to suggest that other branches of the government guard against them. Steps have been taken. Through the doctrine of preemption and through flexibility in sentencing the courts themselves have mitigated some of the potential harshness in the rule. Congress and some twenty states have responded by erecting statutory bars to successive federal-state prosecutions under certain circumstances. Prosecutors may also avoid such successive prosecutions by adopting standard operating procedures or by exercising individual discretion to avoid those successive prosecutions which will not effectuate justice. Exercise of such discretion is particularly feasible within the framework of the traditional cooperation between federal and state law enforcement officials.

Since the success of these attempts to mitigate the potential harshness of successive prosecutions seems important to the author's conclusions, more discussion of such attempts and empirical evidence regarding them would have been welcome to this reviewer. However, the interesting subject, "Prosecutor's Discretion" is disposed of in five pages which are devoted mainly to the directive, issued by Attorney General Rogers a few days after the Supreme Court, handed down its Bartkus and Abbate decisions, instructing federal attorneys to continue avoiding successive prosecutions except under compelling circumstances.

This book, a revised version of the author's doctoral dissertation, is a careful and exhaustive study within its selected limits. The materials of research consist almost entirely of the facts and reasoning in cases, arguments of counsel, legislation and law review articles. As approached, the subject does not lend itself to the newer methods employed in much research regarding the courts nor are such methods used. *Double Jeopardy and the Federal System* illuminates one segment of the constitutional law dealing with persons accused of crime. This segment has resisted the revisionism which has affected other parts of the general area and if Leonard G. Miller's arguments are heeded that revisionism will not be the wave of the future for the dual sovereignty rule.—THORNTON C. SINCLAIR, *University of Houston.*

The Australian Ballot: The Story of an American Reform. By L. E. Fredman. (East Lansing: Michigan State University Press, 1968. Pp. 150. $5.75.)

In the post-civil War era, *laissez-faire* ideas prevailed in politics as well as in economics, and the notion that government should become involved in the printing and distribution of ballots was novel, and indeed radical. But in the late 1880's the hour for this reform suddenly arrived. In 1888 the states of Kentucky (for the city of Louisville only) and Massachusetts adopted legislation providing for an official ballot listing all offices and candidates, available only at the polling place, to be marked there by the voter in secret. Within four years, 36 other states enacted similar laws, and by 1910 the Australian ballot was being used in all but two states.

L. E. Fredman, who teaches history at the University of Newcastle in New South Wales, has written a brief account of the origin of this kind of ballot in Australia, its subsequent adoption in Great Britain, and its rapid acceptance in the United States. He finds that credit for first adoption should go to the state of Victoria, which preceded South Australia by one month (in 1856) though the idea had been advocated in both states during the preceding five years.

The Australian ballot was espoused by Americans from many social and political groups who shared an antipathy for the party organizations of their day. Henry George published one of the first articles advocating it while editing a California newspaper. Richard Henry Dana III, Boston aristocrat, was the prime mover in securing adoption in Massachusetts. Grover Cleveland gave his unqualified endorsement in a major address between his first and second terms. In many states, labor unions provided the main organized support. The midwestern Populists put the Australian ballot in their platform.

In opposition were most of the party bosses. Cleveland's arch-foe, Governor David B. Hill, eloquently denounced the system when he vetoed the first bill to pass the legislature. But popular support appears to have grown rapidly, and one party or the other was likely to endorse the reform in a close election. The only Republican to cast a negative vote in New York's lower house was boss Thomas Platt.

Of course the reformers soon found that the machines were not to be overturned by revision of election-day procedures. They appear to have assumed that the venal voters had so little honor that the secret ballot would make vote-buying impractical, and that the parties would stop assessing the candidates if government relieved them of the cost of printing ballots. But there were plenty of other party expenses for the candidates to defray; and, while some improvements in election-day behavior occurred, it is hard to tell whether these were due to the reform or to more basic social changes. In fact, Fredman's account is spiced with references to another import from Australia—the "Tasmanian dodge" or endless chain, which enabled a precinct captain to provide each paid or intimidated voter with a completely marked ballot, once a single official ballot had been spirited out of the polling place.

Fredman's approach is that of a historian, and he has made good use of manuscripts and contemporary periodicals in describing the adoption of the reform in Australia and several American states, with special attention to the leading personalities in each case. A few dates in some of the standard texts could well be revised on the basis of his work. But much of the book is devoted to a very sketchy treatment of two large subjects—the social characteristics and political ideas of the upper-class, intellectual reformers who provided much of the leadership and publicity for the Australian ballot; and the assortment of electoral reforms that accompanied or succeeded it (direct primary, control of campaign expenditures, initiative, referendum, etc.). Historians will find little new here, and political scientists will find that they must still turn to older works, such as that of Specer D. Albright, for information on the kinds of voting that preceded the Australian ballot, the historical process by which the new system finally became universal in this country, and the widely varying responses that the states made to the many questions of ballot design and administration.

Fredman suggests that two further reforms—the short ballot and the nonpartisan appointment of election officials—are needed to realize the hopes of those who first advanced the Australian ballot. But perhaps a more pertinent and useful extension of their philosophy, in the light of current conditions, would be governmental assumption of some responsibility for providing voters with information about candidates. Public financing of campaign publicity, suggested long ago by Theodore Roosevelt, appears to be as much needed today as was public provision of ballots in 1888.—Henry Bain, *Washington Center for Metropolitan Studying.*

Voting and Nonvoting: Implications of Broadcasting Returns Before Polls Are Closed. By Kurt Lang and Gladys Engel Lang. (Waltham, Mass.: Blaisdell Publishing Co., 1968. Pp. 172. $2.50.)

Election night broadcasts which feature computerized projections of voting results have raised a rather serious policy question concerning the possible impact of these broadcasts on potential vot-

ers on the West Coast. In an election year, such as 1964, when the landslide dimensions of the eastern vote can become known to westerners before they go to the polls, it might be assumed that many on the west coast would simply not bother to vote. Thus, with modern communications methods, the results of an election could be influenced by those very results—or at least the projections of those results.

In order to test the effect of these election night broadcasts on voting behavior in 1964, Land and Lang studied late voters selected from sample precincts in the East Bay area of California. These respondents were interviewed during the week immediately following the election (while memories of election day were still fresh). As a control, the Langs also surveyed a sample of late voters in similar precincts in Cuyahoga County, Ohio, where polls closed before network election coverage began. Ohio was selected since it was also a pivotal state in the presidential contest and also had a highly publicized senatorial contest similar to the Salinger-Murphy race in California.

In general, this is a rather well-conceived research design. Some might argue that a panel design should have been used, rather than just an after-election study. Lang and Lang deal with that argument, citing especially the spurious turnover effects inherent in panel studies.

The major findings of the study should not be surprising to those who, like the Langs, are familiar with the short-term effects of mass media: the election night coverage by the networks was inconsequential in altering voting behavior. Lang and Lang found only one demoralized Goldwater supporter who lost all interest in voting after hearing about the lopsided Johnson margin. In an interesting chapter on "Nonvoting and the Nonvoter," the Langs go on to document the null effects of the broadcasts on turnout. Since the study employed registration lists as sampling frames, it was possible to perform a very careful check on reported voting and non-voting of respondents. The study also explored the possibility of bandwagon effects and/or sympathy votes. Neither type of voting change was discovered.

The authors explain these null findings by what they call the "law of minimal consequences." In essence, the potential voter, if he listens to these broadcasts at all, perceives them within a nexus of other factors. His political attitudes such as involvement and intensity of candidate choice, his previous expectations about the election outcome—perhaps informed by polls and other news—all affect perceptions of election returns. Other factors, such as a close senatoral race, can mitigate the effects of presidential returns.

Lang and Lang explore in some depth the social-psychological factors associated with early knowledge of election returns. Although behavioral change was not manifest, attitudinal changes did take place. In particular, some respondents reported that, upon hearing news of the returns, they were less eager to vote. This was especially true of those who felt certain that the network projections were correct, and also of those whose previous expectations about the outcome were invalidated. The authors continually warn of the implications of their findings on future elections. As the technology of election night projections becomes more reliable and thus more credible to the public, the potential for non-voting becomes greater.

For those interested in utility models of voter choice, Lang and Lang offer a chapter which should prove of some interest. What happens to voters who believe that the utility of their vote is approaching zero? This utilitarian factor is contrasted with other explanations of voting choice based on social-psychological dimensions (partisanship and civic-mindedness). Unfortunately, the measures used are quite weak. "Whether it makes a great deal of difference who won" is used for both utility and partisanship measures; there is no measure of party identification, etc. But more importantly, the data do not shed light on the major proposition we would like to test—that utility changes with certainty of outcome.

In all, this is an excellent, informative study for those interested in the policy questions regarding the delaying of election night broadcasts—indeed that was the purpose of the study. In addition, it offers some useful new information for students of voting behavior.—David E. RePass, *University of Minnesota.*

Government Contracting and Technological Change. By Clarence H. Danhoff. (Washington, D.C.: Brookings Institution, 1968. Pp. 472, $8.75.)

In 1954 Don K. Price wrote a perceptive essay on "Federalism by Contract," (*Government and Science,* Ch. III), bringing to our attention the fact that the federal government's research and development programs were creating a new dimension in public administration—the use of nonfederal contractors (business firms and universities) to perform government work. When Price wrote, about half of R&D was contracted out; by the 1960's the proportion had grown to 80 per cent, where it remains today.

With federal R&D expenditures running at a $17 billion annual level, accounting for two-thirds of all R&D in the United States, and drawing the presumably autonomous spheres of industry and higher education into novel relationships of interdependence with government, one might have thought that political scientists would have

ploughed this ground thoroughly as an area of both practical importance and theoretical interest because of its implications for the conception of pluralism as a system of diverse, autonomous sets of institutions. Such, however, has not been the case. With the exception of scattered articles and a recent book on atomic energy contracting, we have not followed up Price's lead.

Danhoff's book is therefore to be welcomed as the first sustained treatment of the phenomenon of contracting-out for research and development. More descriptive than analytical, it comprises an excellent background reference for the student of government on both the substance of R&D programs and the processes of contracting-out.

Before World War II, legislation and regulations circumscribed governmental procurement contracts rather tightly. The fixed-price, competitive bid system was the norm and almost the exclusive instrument. This was satisfactory for the purchase of Army shoes and civilian typewriters, but broke down during World War II when the need was for the development of new weapons for which no specifications existed. Danhoff details well the gradual shift over to Cost Plus Fixed Fee (CPFF) negotiated contracts and the accompanying rise in the proportion of extra-to intra-murally performed R&D works (Chs. II-IV). After a summary of the roles played by the President and Congress in R&D policy formation (Ch. V), he describes in considerable depth the range of relationships between government agencies and the four categories of contractors: business firms, universities, not-for-profits, and government-owned contract research centers (Chs. VI-IX). These chapters are valuable for rheir detail (and for their bibliographic footnotes) and also constitute a useful introduction to the complexities of the subject for those not already familiar with it.

Given the author's evident intention—to produce a factual guide to the processes, policies and problems of R&D contracting—the book is quite successful. One can still wish, however, that one who had looked at the field in depth would have speculated at greater length on the larger impact on governmental processes and the political system. The material for extrapolation is there. For example, Danhoff notes (pp. 183–184) that by calling in private institutions, government "expands the technical abilities directed to the problem, increases the alternatives to be considered, and may generate more participation by private groups and individuals in the debate" over program development. So far, so good. But he also calls to our attention that (p. 4)

> government has relied upon private institutions, not only to carry out projects already judged necessary, but also to suggest how its objectives might best be achieved, and even what the objectives might or should be.

This is the larger significance of contracting-out, as it is extended from military hardware development to strategic advice, to the operation of domestic soical programs (e.g., Job Corps centers contracted to business firms). The processes of government policy formation are being altered, perhaps radically, and the distinction between private and public in our polity is rapidly becoming meaningless. What do these developments portend? While Danhoff (an economist) does not grapple with this type of question, his book provides much information relevant to a needed examination of an important political system development.—MICHAEL D. REAGAN, *University of California, Riverside.*

Poverty and Politics: The Rise and Decline of the Farm Security Administration. BY SIDNEY BALDWIN. (Chapel Hill: The University of North Carolina Press, 1968. Pp. 438. $10.00.)

Sidney Baldwin has written a major book. In a clear and forceful style, and armed with 18 years of exhaustive research in the primary materials, including 43 interviews, he has analyzed the best part of the agricultural New Deal, the Farm Security Administration (FSA). Formed in 1937 out of antecedent agencies, crippled in 1943, the FSA was replaced in 1946 by the Farmers Home Administration which emerged chastened and "remained . . . docile . . . , attracting none of the enmities of the FSA, but also evoking much less of the excitement and hope that characterized its embattled predecessor."

In 1937–1943, the FSA dealt rather successfully with poverty in agriculture. Its "conservative" Tenant Purchase program had started some 40,000 tenants toward farm ownership by 1943, and its controversial Resettlement Program had tried to place some 10,000 farm families—small numbers in view of 6 million census farmers.

Meanwhile the Rural Rehabilitation (RR) program of FSA made loans and/or grants to approximately one million farm families in dire poverty, outside the ordinary public-private credit systems, often ridden with disease, always poorly educated and frequently semi-literate or less. In 1943, nevertheless, 75 per cent of them had paid back their loans or were fully current. The new social invention of supervised credit, including the joint bank account and the farm and home plan printed on reverse sides of a single sheet, and technical assistance had been successful—and were to be useful in some less developed countries. FSA reinforced them with ingenious programs of debt adjustment, group medical care, and producer and consumer cooperatives. Thus FSA proved that even society's outcasts could be reached and helped. Paternalistic? Maybe. John D. Black put it better: "You have to lead them by the hand." To their ever-

lasting glory, Rex Tugwell, Will Alexander, Paul Appleby, Beanie Baldwin, Pete Hudgens, Jim Maddox, and their patriotic colleagues reached out a hand to those who were sore in need.

"Success" did not mean that the problem was solved. In 1967 President Johnson's Commission on Rural Poverty found millions still living in circumstances that were a "national disgrace" and asserted that urban riots "had their roots, in considerable part, in rural poverty." Had the reactionaries in Congress, in the American Farm Bureau Federation (AFBF), and in the USDA been unable to beat the FSA to its knees, our urban travail might be much less. To be sure, FSA would have had to devise different methods of dealing with the poor as the situation changed; but the imagination shown in the 1930's might well have sufficed! Future attacks on poverty problems will be informed by Baldwin's impressive study, especially by his political and administrative analysis of the triumphs and mistakes (part of the mistakes may have been what Thaddeus Snow called FSA's "bad manners"; but I doubt it. FSA had to be aggressive to get anywhere, in my judgment; and the greatest error would be to confuse FSA's executioners with "gentlemen," Southern or otherwise.)

The FSA story fully justifies even more than the qualified encomiums of the book's last three paragraphs. We need more of Tugwell's "defiant and blasphemous faith" and less concern about "administrative minutiae [and] . . . institutional equilibrium, maintenance, and survival."

Chapters II through VI superbly describe farm poverty and tell the story through the creation of FSA. In chapter VII on "The FSA in Action," generally excellent, I missed an examination of regional differences in administration which might have compared Ernest A. Morgan's more vigorous attack on rural poverty in Alabama and the South East with the more cautious approaches of regions administered from Raleigh and Little Rock. Morgan dug more deeply into "the lower third of the lower third", I believe, and tried harder to reach Negro families. But then Morgan had the staunch support of the Bankheads and Richard Russell, whereas the Raleigh region was saddled with Senators McKellar and Byrd. In chapters VIII and X, despite the careful discussion of FSA's comparative disadvantages, I missed an examination of FSA's workload which ran between 100 and 125 RR families—an unwieldy number, considering the amount of individual counseling needed.

I am puzzled by the statement (p. 237) that Extension, the Forest Service, the AAA, and the SCS made up 30 per cent of the USDA's budget in 1937. Rather, I am sure that the price-support, production-control programs of the USDA have consistently accounted for some two-thirds of USDA's annual expenditures—a fact that has helped make the AAA and successors central in agricultural politics. Again, I should moderate the criticism of FSA for not fully exploiting the potential political support of local committees. AAA's committees became the priesthood of parity; SCS developed an organization of district supervisors with political muscle. These and other agencies, however, could directly organize the more influential farmers. But FSA's clients were as out of it politically as they were economically and socially. FSA advisory committeemen I met in 1941 were much more interested in their Production Credit Associations!

All these points are dwarfed by my admiration for Baldwin's book. FSA's administrative aspects as well discussed, including the uses of governmental information programs (p. 117–118). Congressional relationships are fully treated, especially in regard to Congressional group alignments (p. 321), and the superior strength of the House of Representatives in finally crippling FSA (p. 381 and 386). The book deals comprehensively not only with FSA's relationships to blacks but also to Japanese-Americans after Pearl Harbor. The politically crucial migratory farm labor program is examined. The shortrun advantage and the long-run disaster in the lack of a sound base in legislation are shown. Perhaps above all, the significant role of strategic individuals (for good or ill) is persistently underlined.

Finally, I turn to Baldwin's use of social science theory, beginning in chapter I which, however, concludes that "the scholar's concern with political and administrative means and methods . . . [contains] danger of neglecting substantive ends; and without some attention to such ends, the study of politics and administration may lose its substantive soul . . . Politics and government are inconceivable and meaningless on an uninhabited desert island" (page 16). Subsequently, Baldwin's faithful references to theory are relevant enough but usually add little to his analysis. Indeed, the power and precision of his analytical narrative is often underscored by the frail and diffuse models he adduces. Exceptions are chiefly references to Paul Appleby which always illuminate Baldwin's interpretation.—CHARLES M. HARDIN, *University of California, Davis.*

California's Prodigal Sons: Hiram Johnson and the Progressives, 1911–1917. By SPENCER C. OLIN, JR. (Berkeley: University of California Press, 1968. Pp. 253. $6.95.)

For California, Hiram Johnson is the home politicus par excellence. No governor, before or since, has had such a profound impact on the political process and style of the State. In the preface to

what is a short, clearly written monograph, Olin says he will focus on "the impressive gubernatorial administration of Hiram Johnson, and Johnson's role as a popular and extremely effective governor." In a lively narrative, Olin links together the major political events associated with Johnson's tenure in California (1911–1917): emergence and election as governor, important executive and legislative reforms, "Bull Moose" campaign, and in most detail, the circumstances of the 1916 Hughes defeat. More than six years in preparation, the monograph—a revised history dissertation—is exhaustively documented, with interpretations closely related to available scholarship. To the general reader, Olin presents an interesting and reliable historical account of the conspicuous political events of the Hiram Johnson era in California.

Beyond these noted achievements, however, the monograph proves disappointing. Written to update George Mowry's excellent *California Progressives* (1951), Olin does little more than add footnotes from new manuscript collections and recent dissertations; otherwise, nowhere does Olin attempt major departures or reinterpretations of Mowry. By design moreover, Olin eschews explanation in favor of description—"primary concern is with practice rather than ideology." The result is a facile exercise, however accurate, of historical journalism. At best, the monograph should be viewed as a modestly revised supplement rather than a serious rival to Mowry's work.

To a political scientist, the monograph reads much like an early article in *APSR* or *PSQ*. The book is resolutely descriptive, stressing specific events and avoiding concerns of concept or method. The framework for inquiry appears to be a chronological interest in Johnson's political adventures and reforms. The result is that Olin's selective tour through history lacks apparent direction, raising and abandoning ad hoc themes. Perhaps false hopes are created by the few historians most political scientists commonly read, for example, Benson and Hofstadter. But particularly when the subjects are electoral, legislative, and executive politics, the absence of even the most general findings or observations of political science becomes disturbing. Certainly Olin's statements about election results or "the means by which Johnson sought and won through politics" could benefit from more analytical attention.

Perhaps the most important disappointment was Olin's decision to identify and order events without devoting close attention to his stated focus on the Johnson administration. For in six years, Hiram Johnson led the State to adopt what was then a "radical" list of reforms. The State House record included direct primaries, nonpartisan elections for cities and counties, cross-filing, initiative, referendum, and recall, controls of public utilities, workmen's compensation, conversation of natural resources, comprehensive civil service law, establishment of a legal minimum wage for women and children, and many others. These measures profoundly changed the character and content of the politics of California. How and why Johnson was so signally successful are questions that merit the closest attention, but these unfortunately are not the concerns of Olin—Johnson's political tactics, strategies, goals, and style are, for the most part, left to the inferences of the reader.

Such criticism should be kept in perspective, for Olin's credentials and approach are not those of a political scientist, and perhaps more important, the literature we can offer on California politics is quite limited and with few exceptions, highly descriptive. Except in introductory textbooks for the lucrative junior and state college market, few political scientists have devoted any sustained attention to *California*. None have attempted anything like Seymour Lipset's *First New Nation* or even Duane Lockard's *New England State Politics*. Protests aside, most of the literature is singularly ahistorical. Thus, Olin's monograph is a useful reminder of the importance of the historical context on the practice and ideology of a state's politics. For Olin accurately scores the Johnson deeds and major political events between 1911–1917; and this description should provoke the serious reader to ask the more critical questions about political change and the "authoritative allocation of values" in California. Yet this reviewer hopes that in the future, Olin will use his demonstrated skills in research and writing to clarify and search for explanations rather than report on the news stories of political history.—RONALD O. LOVERIDGE, *U. of Cal. at Riverside.*

Moment in the Sun: A Report on the Deteriorating Quality of The American Environment. BY ROBERT AND LEONA TRAIN RIENOW. (New York: Dial Press, 1967. Pp. 286. $6.00.)

This book is reviewed here particularly because of the demand made at the APSA conference, 1968, for greater policy relevance in our journals. In terms of the concern, underlying that demand, the Rienows' book may well be more important than anything else published by professional political scientists in this generation; the only book which I recollect having reacted to similarly in my lifetime is Myrdal's *American Dilemma*. Yet, *Moment In the Sun* has not, to my knowledge, been reviewed in any social science journal; as it stands, there are understandable reasons why this should be so; and, by one of the characteristic iro-

nies of political ideology, it is likely that the proponents of a "more relevant" political science will be less receptive to its emphases than their less relevance-conscious colleagues!

For, essentially, it makes an extremely comprehensive indictment of the whole notion of economic growth and technological progress as this is generally admired in the United States today. In making their indictment, they have placed in perspective many discrete items of which we are in general only aware as specifics. They have shown how the deterioration of the environment and the reduction in many ways of the quality of life is a consequence of *ungoverned* technology.

The approach is, of course, ecological. The environment is becoming progressively less livable because of such matters as: (a) the unpleasantness of breathing and the contamination of oxygen (with such effects as increased incidence of emphysema and in extreme smog even suffocation) (b) the excruciating increase in noise levels (with consequences not only in irritability but in such physical defects as deafness and possibly even ulcers) (c) the greater severity of flooding in much of the country, and resultant greater danger from hurricanes, etc. (because of the removal of the forest and grass cover) (d) the stench and ugliness of what used to be beautiful lakes and beaches (e) the reckless killing-off of many beautiful and useful species of animals and birds, and the consequent multiplication of destructive insects and "real" vermin, that is to say the upsetting of the balance of nature (f) and, partly following on the last, spraying with and ingestion of pesticides, the dangers of which are unknown and potentially great—which are not regulated, to any significant degree, as yet. Instead "when a proscribed poison becomes too prevalent in a product, (the F.D.A., Department of Agriculture, etc.) simply legalize it." (p. 162). Not content with all these costs of technology, progressive men—including some who advocate conservation in other areas—see a great future in similar exploitation of the ocean depths, because they do not "conceive that the powerful force which slams our coasts . . . is (also) a delicately balanced creation. (Already) in a ceaseless stream . . . man pours his wastes and poisons to transform this primeval cradle of abundant life into a graveyard. This is the 'untrammelled ocean' in which mankind sets so much store (as a source of future foodstuffs!) (p. 197)."

The Rienows have, in actuality, brought Malthus up to date for the waste-producing affluent society. "Science, lassoed by the lariat of commerce, . . . is likely to be a destructive force . . . Desperate to remedy environmental deficiencies, we shall without careful social consideration deface our surroundings even more . . . (for example) engineers are eager to control water shortages by building "hydraulic empires, but "we have seen how all these 'hydraulic empires' now long buried under Mediterranean sands went into a frenzy of . . . building, only to find themselves every year buried deeper in upland silt from the stripped watersheds. Unlike the ancient civilizations, we can not plead ignorance of ecological principles . . ." (p. 207)

But, unlike the ancient civilizations, we must contend with continual population increase, due to the control of epidemic diseases, *and* we have the democratic insistence that everybody is entitled to be affluent—which means to pollute the atmosphere, poison the soil, and leave wastes which destroy the quality of life. If we focus on the problem of poverty, we get campaigns against poverty, emphasis upon economic growth, etc., but if we focus on the problems of the quality of the environment, we have to rethink our emphasis on technological "betterment." If we think about the two together, we are confronted with considerable cognitive strain (until we get accustomed to the juxtaposition). What, for instance, will be the effect of raising economic standards, according to present proposals, in Appalchia, the Ozarks, rural Maine, and the rural South? The people who have been pushing for a policy-conscious political science, by and large, are the people who are committed to, e.g., campaigns against poverty; because of this commitment, they are likely to find the emphasis which the Rienows make unacceptable.

The greatest weakness of the Rienows' book, the other way around, is that it, too, is not written in terms of balance; obviously, for instance, once a control for malaria has been discovered, it will be used; obviously, in human terms, such a control is, on the whole, desirable; as Frank Graham, Jr., says in a review of their book: sometimes "they pile horror upon horror in the manner of an early Elizabethan tragedy" . . . in such a way as to cause some readers to "succumb to shell shock." The weakness is comparable to their predecessor, Malthus; the atmosphere of gloom overwhelms. How, one might want to know, do you strike a balance? Optimally? Or granted a world in which a presumptive Secretary of the Interior expresses grave doubts about "conservation for conservation's sake" incrementally?

At this point, we come to the kind of policy relevance which concerned people everywhere have a right to ask from political scientists. For policy problems, taken seriously, as analytic conceptions, rather than as the bases for doctrines, involve weighing and balancing, in the words of former Congressman and Philosophy Professor T. V. Smith, "the turning of principles into interests."

But, since no other writer, either on conservation or on civil rights, poverty, et cetera, has to my knowledge tried to balance the seemingly incompatible values here against each other or tried rigorously to work out ways to escape between the horns of the apparent dilemma, *Moment In the Sun* must be enthusiastically recommended.—LEWIS A. DEXTER, *Dalhousie University (visiting)*.

COMPARATIVE GOVERNMENT AND POLITICS

Political Development in Latin America: Instability, Violence, and Evolutionary Change. BY MARTIN C. NEEDLER. (New York: Random House, 1968. Pp. 210. $2.45.)

Latin Americanists in our discipline have long been criticized for their failure to incorporate modern methods of political analysis into their research. Past studies have tended to rely on recognizably outmoded, traditional approaches or have failed to take note of significant work emanating from related fields. Consequently, the study of Latin American politics has acquired an altogether too well-deserved reputation for archaism, loose methodology, and, in a few cases, poor scholarship. Notable exceptions exist to be sure; Kalman Silvert and Charles Anderson are only two of a growing number that have urged the application of more stringent techniques and have attempted to set examples through their publications. On the whole, however, Latin America has taken a back seat regarding modern political science. Specialists trained in other geographic areas have produced some of our most valuable studies, although unfamiliarity with historical, cultural, and anthropological patterns of the continent has caused certain additional problems.

Happily, Professor Needler has combined the talents of the methodologist with those of the professional Latin Americanist. *Political Development in Latin America* is a short but firm step to remedy the lamentable situation described above and is exactly what the author intends it to be, ". . . no more than an early stage of succession of increasingly exact or comprehensive approximations." (p. 7) A concise and conceptually clear model is presented, hypotheses are drawn and tested, and the reader feels that loose ends are finally being pulled together. At the same time, Needler is plagued by the same old bugaboo that has discouraged other Latin Americanists from attempting quantitative studies; sufficiently accurate "hard data" suitable for comparative purposes are not available. This dilemma is readily acknowledged, and the reader is cautioned to accept all conclusions as "suggestions" rather than demonstrable proofs. The suggestions are condensed into a set of twenty-three theorems that will hopefully become hypothetical assumptions to be tested by future analysts as data become available.

One might not always agree with either the definitions or operationalizations of Needler's concepts, yet they seem tenable given the dearth of data and previous systematic studies. The reader is assured that the major dependent variable, political development, should not necessarily be confused with "democracy" or "democracy as currently practiced in the United States." Development is defined as the transition from one stable state of equilibrium to another so long as that transition is in the general direction of the societal goal; the societal goal, in turn, is defined in terms of the ideological norms a polity posits for itself. In the case of Latin America, Needler argues, the ideological norms do, in fact, approximate current North American and Western European political practices since the area has been so heavily influenced by the western powers. Written constitutions are often little more than Spanish translations of the Philadelphia document, the mass media has been fed by western news services, and generations of Latin political leaders have received their educations in the *patrias* of Jefferson, Locke, and Montesquieu. Hence, although developmental goals are not synonymous with democracy in a theoretical sense, the peculiarities of the Latin experience make them alike in practice. In other words, the Latin Americans have posited democracy as the ideological goal of their polities. Democracy itself is conceptualized as: 1) the maintenance of constitutional integrity (assuming that written constitutions are democratic in content) plus 2) extensive popular political participation.

Certain semantic problems occur regarding the words "stability," "development," "change," and "democracy." Stability, we are told in the introductory chapter, is to be regarded as a type of homeostatic equilibrium; development is the transition from state to state in the direction of the ultimate goal. One, then, must regard "change" as any type of movement, whether in the general direction of the goal or not. Unfortunately, "stability" is often used in subsequent chapters as a synonym for "constitutional stability" or "constitutionality" (which is, by definition, one aspect of the societal goal, democracy); at other times "stability" appears to mean nothing more than the absence of open violence. Likewise, change and development tend to be used interchangeably, as do development (the transitory process) and democracy (the final goal). Consequently, the reader

becomes somewhat confused. Normally, these substitutions could be excused as stylistic attempts to avoid cumbersome repetition, but they cannot be overlooked in a book whose *raison d'etre* lies in the purity of its methodology and the "tightness" of its concepts. These problems should be regarded more as inconvenient nuisances than major faults, however.

This reader found the chapter concerning interrelationships between economic and political development the most intriguing. Past studies have attempted to correlate either constitutionality or, to a lesser extent, political participation with economic growth, but the simultaneous comparison of both aspects is a genuine contribution. Through very crude statistical tests Needler proves (suggests) that political development toward democracy is indeed positively related to economic development, although not necessarily in the "intermediate ranges." In simplest terms, both aspects of political transition cannot occur simultaneously unless economic growth is parallel. For example, if participation increases faster than the economy, depressed participants will overload the system with "other-than-peaceful" demands, often provoking military intervention and consequent loss of constitutionality. Alternately, if constitutionality outdistances economic growth, mass participation cannot be prevalent. The deference displayed by the British masses is cited as an example of the latter alternative. Numerous other hypothetical implications could be derived from this thesis—hopefully they will be analyzed in the near future.

In conclusion, the serious scholar seeking to incorporate modern theory and techniques into his research can gain much from this modest though significant study. The conceptual framework is sound, operationalizations and tests are crude but reasonably exact, and a host of new insights are suggested. Every bit as noteworthy, important contributions of Almond, Coleman, Easton, LaPalombara, Powell, Pye, Verba, Weiner and other innovators are finally being applied to the study of Latin American politics. This book definitely merits its adoption as a supplementary text in graduate and undergraduate courses concerning politics of the Latin American republics or political development in general.—BURT H. ENGLISH, *The University of Kansas.*

Egypt: Military Society. ANWAR ABDEL-MALEK. Trans. C. L. Markmann. (New York: Random House, 1968. Pp. 458. $8.95.)

Egypt: Military Society: The Army Regime, the Left and Social Change Under Nasser (a translation and revised updating of *Egypte: Societe Militaire* first published in 1962) clearly qualifies as the most important socio-political analysis to appear dealing with post-1952 Egyptian politics. Ahe combined product of reflective intellectual insight and exhaustive scholarly research (based almost entirely on Arabic sources but also accompanied by a command of European and American secondary scholarship) it is simultaneously thematic and exhaustive. Its theme derives from the Egyptian-Coptic birthright and Marxist ideological commitment of the author. Thus a portrayal of Egypt's essential national identity (rather than Arab identity) emerges while the substance of the book details the vacillating fortunes of the Egyptian Communist Party under President Nasser. The conceptual framework of the book is also Marxist in its concern with the economic basis of social and political factors. The utilization of this framework, as one might anticipate, has its difficulties but Abdel-Malek more than any other present scholar elaborates for us in a sympathetic manner the social basis of the regime and its policy shortcomings.

The book consists of four sections entitled: (I) "Egyptian Society Before the Coup d'Etat," (II) "The Social Character of the Military Regime," (III) "In Search of a National Ideology" and (IV) "The Value of the Egyptian Experiment."

In Part One "Egyptian Society Before the Coup d'Etat" there is found a compact treatment of largely nineteenth century and pre-1952 history which is instructive in its discussion of the relation of the growth of individual land ownership in nineteenth century Egypt to Egyptian social structure and the manner in which this relationship is related to the politics of particularly the post-1924 parliamentary period. What emerges is a strongly sympathetic interpretation which sees the Wafd during the entire period and the Left after 1945 as the true registers of Egyptian political sentiment while the large landowning class and industrial class are seen (correctly) as having dominated the formal processes of government in collaboration with the Palace. As he accurately notes, the Wafd as the truest political expression of the Egyptian people only ruled a total of seven out of twenty-eight years and, he might have noted, never for more than twenty-four months and this only in 1950–52 when perhaps partly as a result of persistent exclusion from the political process it was flaccid, energyless and without authority.

In Part II, "The Social Character of the Military Regime" he presents an acute sociological analysis of the shifting class alliances of the lower middle class military regime. Thus the 1952 Agrarian Reform Laws are seen primarily as political and economic in intent and not drafted in terms of the aims of social justice. They were successful in destroying the economic base of the large landowning class but they were unsuccessful in diverting this class's economic resources from the

agricultural to the industrial sector. In the late 1950's his economic failure became apparent and the alliance of the regime came to be with the industrial middle class. The failure of the union with Syria was due at least partly to the manner in which this class sought to take economic advantage of the Syrians and the July, 1961 reform laws and arrests in late 1961 and early 1962 were intended to remove this class. Since that date the military has ruled in alliance with the technocrats of what the author terms the American-German school of administration.

Part Three "In Search of a National Ideology" documents the ideological groping of an essentially pragmatic regime. The regime is characterized as being persistently and forceably opposed to a Marxist ideology and incapable of generating one of its own. In the course of his discussion he elaborates at length upon what can be said to be one of the two greatest failings of the regime, that of its inability to attract to it the abundant imagination and creative talents of Egypt's intellectuals (the other failing is that of not having enlisted in spontaneous fashion the support of Egypt's rural masses).

Finally in Part Four, "The Value of the Egyptian Experiment" he concludes that contrary to the regime's claims it is not socialist because the profit motive operates in the milieu of state capitalism with all decisions being made at the top and with no provision for the expression of popular demands. He concludes with an appeal for a return to pluralistic democratic politics in Egypt while at the same time noting that the present regime's fifteen years in power and the June, 1967 defeat have created the potentialities for genuine social reform.

As already noted, Abdel Malek analyzes in detail the nature of one major failing of the regime namely its alienation of Egyptian intellectuals. His explication of the failure of the regime to mobilize the rural masses and transform (contrary to the author's assertion, p. 62) their historical political passiveness is perhaps the least convincing portion of his analysis. His analysis rests largely on the distracting qualities of the regime's agrarian reform programs and its unsysmpathetic bureaucracy rather than upon the actual sociology of the countryside. As long as the maximum land holding (as of July, 1961) continues to be 100 feddans (roughly acres) we can speculate that the peasant's traditional subservient relationship to his umda (village headman) and the latter's subservience in turn to the resident landowning class (50–100 feddans is usually considered a large holding) has not changed. It is this relatively untouched character of the countryside which perhaps at least partially explains both the relative stability and the persistency of libertarian or from the point of view of the regime "rightest" sentiments in Egypt after fifteen years of revolution. The dilemna of the regime is real, for to reduce the size of the maximum land holding would probably result in an amount of agricultural economic dislocation that Egypt's tightly drawn economy can not tolerate.

A further minor comment is in order in reference to the development in the last chapter of how the army in modern Egyptian history (i.e. from 1882) has grown with Egyptian nationalism (p. 360). This is not true and is lost sight of by many analysts of the army and the Egyptian regime. After the disbandment of the army in the wake of the Arabi rebellion Egyptians had little military and no political role in their army until the date of Nasser's entry into the military academy in 1937. Once alerted to the potential bias involved in a Marxist analysis, this book can be read with equal profit on the two levels of general background and minute attention to its detailed documentation.—Louis J. Cantori, *University of California, Los Angeles.*

Managerial Power and Soviet Politics. By Jeremy R. Azrael. (Cambridge: Harvard University Press, 1966. Pp. 258. $4.95.)

The political potential of Soviet managers and economic administrators to influence the development of the Soviet regime has been a subject of speculation ever since the Bolsheviks came to power. Even before the Revolution, as Azrael shows, anarchist writers had argued that the result of Marxist revolution would be to replace the capitalist exploiters with a new ruling stratum of engineers and technicians. Since the Revolution its enemies have relied on Soviet administrators and technicans to divert the regime from revolutionary aims, while such functionaries have appeared to friends of the Revolution as a chief source of the danger of its subversion.

The worst fears of some, including men who dwell in Peking, have been realized—or so they say, but they obviously exaggerate. Even if, as may plausibly be argued, the regime's revolutionary dynamism has been attenuated and economic technicians have contributed to this result, fundamentally the regime remains what it was. It has not been transformed into the administrative-technocratic state predicted by some, or into the liberal-democratic state hoped for by others. Were such expectations warranted in the past? Are they warranted today?

In his effort to answer these questions, Professor Azrael of the University of Chicago has reviewed the place of managers and specialists in the Soviet scheme of things. His definition of the managerial

elite—"those executives who have borne primary responsibility for the administration of Soviet heavy industry" (p. 7)—properly includes economic administrators as well as factory managers. (By limiting their sphere to heavy industry, however, Azrael creates some unnecessary difficulties.) He was not satisfied to look only at recent developments, but carried his research back to the beginnings of the regime and even to the doctrinal controversies that preceded its founding. *Managerial Power and Soviet Politics* is at once *scholarly*—being based on a close reading of Soviet writings on the subject, as well as on relevant speeches of Soviet leaders; *journalistic*—since Azrael reports on views he encountered among managers during an extended stay in the USSR; and *polemical,* since he has strong opinions which he sets against those who have written differently on the subject. The result is a closely argued analysis which, though somewhat involuted at times, is written with a lively and forceful style and is both rewarding and often extremely interesting. One of the book's chief virtues is that it makes accessible a great deal of information on the problem of the managers, that lay buried in old Soviet books, and has directed Soviet scholars to the sources where more can be found, and where Azrael's own findings—some of them disputable—may be further tested.

The book is not without flaws. At times, after making a valid and original point, Azrael carries his argument further than the evidence warrants. He is able to show, for example, that contrary to a common view, the patristic writers (Marx, Engels and Lenin) recognized the need for authority and discipline in socialist industry. He goes on to assert, however, that according to the patristic doctrine "the old management forms . . . were to remain essentially what they were" under capitalism (p. 15). The evidence he cites does not prove this; moreover, we are told that many party theorists believed the patristic doctrine to be the opposite of what Azrael says it was (p. 41), and that Lenin himself engaged in "purposeful obfuscation" of that doctrine. Occasionally Azrael mis-stated the evidence, as when he says that Khrushchev at the Twentieth Party Congress "proposed that the central ministries should be stripped of most of their operational functions and perhaps even completely abolished" (p. 132). Actually, Khrushchev never mentioned the possibility of abolishing the central ministries before he suffered a defeat at the hands of the economic bureaucracy at a meeting of the Central Committee in December, 1956.

On the central theme of the book, Azrael succeeds in exposing the serious difficulties in the determinist view that industrialization and economic development inevitably lead to the administrative-technocratic state, or, as some would argue, to the democratic state. This is a useful service. Azrael's target is not limited, however, to such economic determinists. He is also critical of the view that the managers have a large political potential which, if realized and used in accordance with their inclinations, could lead to major changes in the character of the Soviet political system. Unlike some critics of this view, Azrael does not deny that the managers constitute a distinctive political group in the Soviet system, or that it has characteristic political views that have sometimes brought it into conflict with the party apparatus. However, he is inclined to emphasize the docility of Soviet managers and their willingness to submit to the will of the power-oriented leaders of the party apparatus. He also stresses their political incapacity once they do enter the political arena. The managers have failed to take power or win great political influence in the past and, in Azrael's view, the prospects are that they will not do so in the future.

What of the widely held view among Sovietologists that economic administrators played an important political role in the Stalin succession crisis? Azrael will concede only that "managerial support was not a completely negligible factor in the political arena" (p. 131). This assessment—oddly, it is perhaps Azrael's strongest acknowledgement of the political significance of the managers—indicates how far his zeal to refute the economic determinists has carried him in downgrading managerial power. Actually, the economic bureaucracy played a major role in recent Soviet political history, and its political potential remains high. How far it is realized will depend on such circumstances as the political capacity of its leaders and partisans and the depth of factional divisions among leaders of the party apparatus, especially during crises of succession.

By providing the first systematic examination of managerial power and Soviet politics Azrael has contributed importantly to Soviet studies. Political scientists who are interested in the role of managers in other regimes, as well as in the broader question of the relation of economic progress to political development, will find here much that is relevant and useful for their purposes.—MYRON RUSH, *Cornell University.*

Les Familles Politiques Aujourd 'hui en France. By EMERIC DEUTSCH, DENIS LINDON, PIERRE WEILL. (Paris: Minuit, 1966. Pp. 126.)

The book presents the political opinions of the six "political families"—extreme left, moderate left, center, moderate right, extreme right, and the *marais* (nonparticipants)—into which the French electorate is divided, the party identifications of

the families, and their voting patterns in the 1965 presidential elections. Classification was by self-assignment on a left-right scale.

Responses to questions on political issues reveal the absence of sharp ideological division between left and right. Except for the extreme left, considerable heterogeneity of opinion exists on most issues within each political family. On no question do as many as three fourths of those in the moderate and extreme left oppose three fourths of those in the moderate and extreme right. In some cases, a large segment of the left takes a "right" position, e.g., against nationalization; in others, the right takes a "left" position. Despite the lack of sharp ideological cleavage, the authors assert that a "temperamental" difference continues to divide left from right, with the two groups having broadly different opinions on most issues.

The survey data on which the study relies suggests an asymmetry between left and right, stemming from greater ideological homogeneity on the right than the left and a greater affinity of the center for the right. Analysis of the political families' attitudes toward political parties also reveals a cleavage between the moderate and the extreme left. Whereas the right is relatively united politically, the moderate left displays great hostility toward the PCF. (And the surprisingly lukewarm approval of the moderate left for its "natural" home, the FGDS, helps explain the FGDS' collapse in 1968.) The survey data also underline the fundamental conservatism of French politics. Political and ideological fragmentation on the left constrasts with homogeneity on the right. The center and the *marais* lean toward the right. (The *marais* hardly participates politically but, when it does, expresses rightist opinions and behaves in a rightist manner.) The center, moderate right, extreme right and *marais* total 65 per cent of the sample, the left, 35 per cent.

As one of the early efforts in French survey research, it is to be expected that the book contains weaknesses. The assertion that French political opinion is divided into six families is an artifact of the scale; if respondents had been asked to place themselves on a scale with a larger or smaller number of segments, the number of political families would have varied accordingly. Futhermore, while the authors are free to choose which groups to analyze, one might question the emphasis placed on the six families. Especially given their lack of ideological and political homogeneity, more profitable results might have been obtained from a focus on the different groups of party identifiers—who have a political reality that, as the authors themselves argue, is lacking for the political families.

More serious, if major attention is to be centered on the political families, they should be defined with care. Yet the *marais* is constructed—and distinguished from the center—in a most questionable manner. Two groups of respondents are combined to form the *marais*. One, the non-participant center, consists of respondents who classified themselves in the center of the political continuum but reported little or no political interest. Whereas respondents placing themselves anywhere but the center who reported little or no political interest were considered part of their self-assigned group, the non-participant centrists were assigned to the *marais*. The other constituent of the *marais* consists of respondents who refused to classify themselves on the left-right continuum. The two steps requiring explanation are thus the separation of the participant and non-participant centers (unlike the two segments of the other political families), and the grouping of the non-participant center with the politically unclassified.

The authors explain that, for all political families but the center, "There weren't sufficiently large differences to justify separating participants and non-participants." For these families, "there weren't appreciable differences in opinions and behavior between participants and non-participants. On the other hand, the participant center distinguished itself sharply from the non-participant center, which closely resembled the unclassified." (p. 20) However, inspection of appendix 10, where responses to questions on issues are tabulated for participants and non-participants in each family, suggests that the data do not support the hypotheses. Within the extreme left, participants and non-participants diverge more than the two center groups as frequently as the reverse. The two wings of the extreme right are also nearly as divergent as the two wings of the center. The divergence between the two groups of the center is thus not necessarily greater than the divergence between the two components of other political families.

Moreover, the additional step of combining the non-participant center with the unclassified is also unwarranted: the non-participant center resembles the participant center and the non-participant right about as often as it does the unclassified. While the authors might be perfectly justified in assigning the non-participant center to the *marais*, the reason would be their lack of interest, not their opinions. Either way, however, the non-participant center should not have been treated differently than non-participants from other political families.

The consequence of the methodological flaw is that the proportion of the nonactivists, the *marais*—32 per cent of the sample, according to the authors—is either inflated (by erroneously assign-

ing to it the non-participant center, which constitutes 22 per cent of the sample), or depressed (by not including the 31 per cent of the sample constituted by non-participants located elsewhere on the political spectrum). Whereas the authors express surprise at the large dimensions of the *marais*, American political scientists might assert that, on the basis of the data presented in *Les Familles Politiques*, the proportion of nonactivists in France is double the size of the *marais*. Subsequent survey research in France should benefit from the book's strengths—and weaknesses.—MARK KESSELMAN, *Columbia University*.

Il comportamento elettorale in Italia. By VITTORIO CAPECCHI et al. (Bologna: Il Mulino, 1968. Pp. 474. L. 10,000.)

This book is the first product (there are to be three additional volumes) of a major research undertaking conducted by the *Istituto Carlo Cattaneo* in Bologna and sponsored by the Twentieth Century Fund. The overall theme, or object of inquiry, is political participation in Italy. Capechi's work, as befits an introductory volume, is concerned with that broadest of all modes of political participation, national voting behavior.

The method of voting analysis employed might best be described as self-consciously ecological; it is ecological in the sense that the study reports associations between particular geographic voting patterns and census-derived demographic variables, while it is self-conscious in that the authors are aware of the predictive limitations imposed by this approach. There is, in fact, a methodological essay in the Appendix in which the warnings of Alker and Ranney along these lines are catalogued and discussed. As to the inevitable question about why no use was made of the available survey data (the *Istituto DOXA* has been sampling Italian opinion since 1948), the authors respond by noting that such surveys have tended to underestimate the extent of popular support for Left parties, particularly the Communists. They explain this latter phenomenon in terms of the wariness with which Italians, especially those hostile to the regime, confront the interview situation.

More specifically, the book is organized so as to portray continuities and shifts in party strength throughout the country over the 1946–1963 period. After a short and useful chapter on Italian electoral history since unification, concerned with the extension of the franchise and the rise of mass parties in the pre-Fascist epoch, the authors begin their analysis making use throughout of two basic sets of data: electoral returns at the communal level and the censuses of 1951 and 1961. The version of the party system employed is a simplified one with only the Communists and Christian Democrats treated as discrete entities. The remaining parties are reducted to two *ragruppamenti:* the Non-Communist Left and the Right.

Although Italy's seven thousand some-odd *communi* are taken as the basic units of analysis, the writers cluster them in ways which permit the examination of broader regional voting configurations. To this end the analysis is conducted not only at the communal and provincial levels, but also at the "zonal." The country is divided into six "zones;" the Iron Triangle of Piedmont, Lombardy and Liguria, a "White" zone which is defined as having a Catholic sub-culture and includes the Veneto plus surrounding provinces, a "Red" zone in the center of Italy—Emilia, Tuscany, Umbria and the Marches—to which a left or socialist sub-culture is ascribed, and finally the South plus Sicily and Sardinia are accorded separate zonal statuses. Having defined the geographic entities to be used, the authors then go about their task, making imaginative use of transition and correlation matrices and linear causal circuits along the way, of relating party voting patterns to an array of independent variables.

Perhaps the most general and striking of the authors' substantive observations is the growing stability and/or nationalization of Italian electoral behavior over the post-war period. First, with respect to the Left, it is reported that the percentage of the vote received by all Left parties, including the Communist, has remained relatively constant, but within this gross pattern the Communists have been receiving a growing share of the other Left parties in the "Red" zone of central by the party's ability to attract voters away from the other Left parties in the "Red" zone of central Italy and its increased attractiveness in the just-now modernizing South—thus off-setting Left losses in the North. In other words, the Communist gains may, in large measure, be explained by the fact the South is becoming more like the North.

Second, there appears to be a rather similar pattern occurring at the Center and Right of the party spectrum as well. Namely, the Christian Democracy has been gradually increasing, at a slower rate and more unevenly than the Communists to be sure, its proportion of the total Right vote. Here again, it is in the South where most of the Christian Democratic gains have been registered. The Liberal party's role in the North, as a repository for disaffected Christian Democratic voters, has seemingly limited the latter's absorptive capacity.

What impresses the authors most about the electorate's growing homogenization is that this secular trend has taken place against a socio-economic background of unparalleled urbanization

and industrialization. But what strikes this reviewer as being of significant interest is the incompatibility between the work's empirical findings and Sartori's recent analytical theorizing about the Italian party system's growing fractionalization and centrifugal drives.

It is also relevant to note that Communist strength has grown in areas undergoing rapid socio-economic change i.e., increasing urbanization, literacy and industrialization, while an expanded Christian Democratic vote, for the most part, shows either no correlation or a negative correlation with the introduction of these processes. A point at issue here is whether the Communists' vote benefits from the presence of these characteristics per se or if the party's growth derives more from the process of change itself. On the basis of a considerable amount of data, the authors opt for the second alternative. They point out, for example, that the Non-Communist Left's vote is strongest, or has declined least, in areas like the Iron Triangle which are already heavily industrialized. This observation, in turn, may be interpreted as providing additional evidence in support of the Benjamin-Kautsky hypothesis about the curvilinear relationship between Communism and modernization.

The book's findings are marred by the strategy of analysis in at least two ways. First, the authors' decision to regard the Italian Right—Liberals, Monarchists and Neo-Fascists—as a single unit rather than as modern, business-oriented Right and traditional, clientele Right, leads them into drawing some rather bizarre conclusions about the relationship between "Right" voting and economic growth. Second, with respect to the construction of "White" and "Red" zones—areas reputedly possessing Catholic and socialist sub-cultures—the writers ascribe the Christian Democratic and Communist successes in these areas to some ill-defined form of community pressure. Yet they offer no data which might serve to demonstrate the existence of these sub-cultures other than the tautological proof of habitual voting patterns.

On balance though, the volume represents a considerable advance, particularly in terms of the rigor of the statistical measures used, over the earlier work of such scholars as Mattei Doggan and Giovanni Schepis.—LEONARD WEINBERG, *University of Nevada.*

Local-Level Politics: Social and Cultural Perspectives. ED. BY MARC J. SWARTZ (Chicago: Aldine, 1968. Pp. 437. $9.75.)

This book is the revised publication of papers presented at a conference on political anthropology held in Austria in 1966. A theoretical introduction by the editor is followed by seventeen empirical case studies and one methodological piece on the study and measurement of social networks (Barnes). Seven of the cases are African, including one that compares African and Melanesian meterials; five are from India, and one each from Burma, Norway, Mexico, circumpolar regions—particularly Siberia and the Aleutians, and Taiwan. In all of the cases, the emphasis is on the political life of local communities, or ethnic groups as polities in and of themselves and as parts of larger wholes. There is as well a refreshing sense of time and change introduced. In each of the cases, we are able to see the local political system, not as some timeless, assumedly equilibrated system operating in a fictionalized ethnographic present, but as living political structures whose actors adapt and change (or fail to) in a changing world.

The theoretical introduction by Swartz carries forward the ideas he presented with Turner and Tuden in his pervious book, Political Anthropology. Swartz eschews what he calls the structural-functional approach and uses instead the analysis of events which are sorted basically into political "fields" and "supports." A field is defined as the "interest and involvement of the participants in the process being studied . . ." (p. 9). Supports are seen as "anything that contributes to the formulation or implementation of political ends" (p. 19). The editor feels that by analyzing the political goals of actors in the "field" as these go through a set of phases, and by isolating the various supports given to actors or groups, a processual and "dynamics" analysis of political activity can be obtained from data collected at the local non-Western level. This level is often characterized by a non-differentiation of political activity from other action and thus a mode of analysis of *the* political is a difficult methodological problem in anthropology.

Swartz admits that he has not presented a full-blown theory and more importantly he also admits that most of the material in the book is "chiefly concerned with different aspects of the structure of the political arena" (p. 49). In other words the editor has adopted a number of conceptual categories, "field," "arena," "support," "regime," "phase" which he feels can be used more adequately to describe (e.g. "field") and analyze (e.g. "support") political phenomena. However the concepts are not related to one another in a systemic manner such as to create a general, explanatory picture of a local-level polity, nor are hypotheses generated for wider testing on larger, or other samples of cases.

On the other hand, this is the strength of the theoretical approach that Swartz wishes to run away from (but which re-appears in the case descriptions). Using political structure as a variable to define boundaries around a political system as

well as the skeleton of the system itself creates the basis of a general theory from which explanation and hypotheses can flow. By contrast the use of a "field" of political activities creates serious boundary problems (as Swartz admits) which make it a difficult unit of analysis. The criticism that structural approaches are not dynamic is refuted by the case studies—almost all of which deal with change and focus on the political structure in order to carry out the analysis. The most ambitious essay in the book (Bailey) attempts to create a theoretical environment in which various types of conflict are operating. In creating the model Bailey states categorically that he is using political structure as a dependent variable (p. 292). Another example of this denial, but affirmation by operation, is the chapter by Nicholas who sharply criticizes structuralism (p. 297–98) then proceeds to develop a flexible approach to the categorization of rules (the content of structure) which he then applies to Indian case material.

The only real exception to a structural analysis is the chapter by Hughes who writes a fascinating psychological analysis of Eskimo leadership. In it he develops further his transactional approach and introduces the concept of competence to explain various aspects of role behavior. Since the editor's use of Lewinian field theory depends by definition on "involvement" and "interest" i.e. on motivations, it would have been useful to have a more full-blown integration of Hughes' psychological theories fitted into the more general ideas in the introduction. In this vein it is interesting that Hughes, unlike the editor, does not criticize structural approaches as being wrong-headed. Instead, he performs the task of adding psychological depth to a structural feature, that of leadership.

What Professor Swartz and some of his colleagues wish to criticize and change can be labelled naive structural-functional analysis. In this approach the researcher describes the set of rules which are the traditional constitutional basis of political action for the actors, as if such rules were the sum total of all political behavior of the actors in these small societies. Then, as Radcliffe-Brown claimed, social process is assumed to be the functioning of structure. This produces a timeless, static, functionally integrated system common enough in the ethnographic literature, and probably non-existent in empirical reality. The criticism is well-taken, but as the essays themselves prove, naive structuralism is something of a dead issue. The question then becomes—should we tinker and adopt the structural approach to include the actual processes of political behavior, of which structure is one element, or should we look for an entirely new paradigm? As the editor notes (p. 2), I lean to the former view, while he spouses the latter, although as I have already noted, espousal and practice seem to differ—at least in this multi-authored volume.

In terms of the information presented, this collection is rich and varied. Only rarely if at all does the formally trained political scientist invest the time and energy in such far away places to obtain the kind of data presented in this volume. And yet this is the day-to-day stuff out of which politics is made in the new nations. Elites come and go; some have greater impact than others. But what that impact is and how the life of the nation is affected by the modern world is to be found in materials such as the excellent case studies in this book.—Ronald Cohen, *Northwestern University.*

The Japanese Socialist Party and Neutralism: A Study of a Political Party and Its Foreign Policy. By J. A. A. Stockwin. (New York: Cambridge University Press, 1968. Pp. 197. $6.50.)

Recent scholarship which has just begun to "explain" postwar Japanese politics rather than to merely outline its effects, has been well served by Dr. Stockwin's new study of Japanese Socialist foreign policy. It concentrates on one of the most important and divisive issues which has effected the Japanese Socialist party since the end of the Second World War. Neutralism in the sense of keeping Japan out of the cold war has had strong adherents among all the opposition parties ever since the question of independence from the occupation came up. It has taken the form of the desire to avoid military alliances or foreign bases in Japan, and to make peace treaties with both West and East including Communist China and the Soviet Union. Since such neutralism means greater independence from the United States, it also means a certain degree of anti-Americanism—at least in basic foreign policy orientations. Nor, is this feeling confined only to the opposition. Even among some major leaders in the dominant Liberal Democratic party today a desire for a more independent foreign policy permitting Japan to have better relations with its Communist neighbors is quite influential.

Although the book reviewed here is confined to the Japan Socialist party in general, it does not neglect to carefully consider the effects of the external environment of the relations of the major powers upon Japan as well as important changes in domestic politics. This has the effect of making the study of considerable value to anyone wishing to understand the most divisive issue which has beset Japan since World War II. It is the key issue influencing relations between it and the United States today.

To explain the genesis and changes in the neutralist policy, the book delves into the most basic processes at work within what is the leading oppo-

sition party in Japan—a party which looks increasingly as though it can not govern or replace the dominant Liberal Democrats for whom it supplies the principal competition and criticism in politics. It is especially interesting to note, as does the former Prime Minister Yoshida in his memoirs, that it was a coalition cabinet under the Socialist Prime Minister Katayama in 1947 which first conceived the notion of relying upon the United States for Japan's security. Yet, since 1949, when the NATO allies first seriously determined to obtain a peace treaty with Japan, the Socialist party has consistently opposed dependence upon the Western bloc for its security. This apparent *volte-face* is explained by the weakening through loss of Diet seats of the early dominant rightwing faction to which Mr. Katayama belonged and the subsequent ascendency of the more radical Marxist factions. The latters' doctrinaire anti-capitalism makes them anti-American and prefer non-aligned neutralist policies when these do not take a form which favors "socialist" countries like Communist China or the Soviet Union.

The Japanese Socialist party factions have long been noted for the extraordinary doctrinal consistency with which their leaders went back to early socialist parties organized in the 1920's for answers to questions about the nature of Japanese capitalism and the best means of overthrowing it. This consistency of doctrine was found in several streams identified with different leaders who survived the militarism and nationalism of the 1930's and 1940's. Some of these same men have led their factions in the parliamentary party till rather recently. Their rivalry for the major posts—particularly the secretary general or chairman—usually determined the direction of party policy. Since this struggle has taken the form of a rather rigid argument over points of socialist theory, the party has had a reputation for impracticality. This has not been tempered by the need to be ready to take office quickly because of the long continued disparity of votes and seats with those of the dominant parties.

Dr. Stockwin demonstrates, however, that beneath this intra-party maneuvering there is considerable awareness of conditions abroad and in Japan by the Socialist leaders who, after all, show considerable political sophistication in working within the peculiar framework of doctrine and group expectations which make up the party's own internal political process. He also believes the party shows increasing similarity to the less ideological conservative Liberal Democratic party whose factions are also mainly parliamentary party ones supported by personal ties to a few prominent local supporters but without any really significant mass organization. This presents an interesting contrast with the much smaller parliamentary groups of Communists and the Buddhist Soka Gakkai parties which have active local organizations vastly outnumbering the Socialists. The last named here, nevertheless, still managed to garner the major share of the opposition vote in Japan, although the ability to do so is shrinking perceptibly.

The Japanese party also contrasts with the Italian Socialist party which is compared in the last chapter. The European party shows an interesting similarity to the Japanese in foreign policy positions and in its factional alliances. The ability of Nenni to revitalize his party through appeal to the rank and file over the heads of its entrenched officials contrasts, however, with the unsuccessful Japanese party attempt under a leader like Eda to do the same in Japan where such local organized membership and voter loyalty is lacking.

It is striking in a wider context how the influence of more pragmatic Japanese Socialist leaders like Eda seems to rise with the tendency toward detente between the major powers in the Far East. The recent signs of a real Far Eastern "thaw" since the book was written has already given further evidence of this influence in the shaky but renewed appearance of Eda in the office of secretary general. The account of the often close but internally vexing relations of the party with the leaders of Communist China in recent years provides a particularly informative and valuable kind of reference material on the relations between external foreign contacts and internal intra-party competition.—FRANK LANGDON, *University of British Columbia.*

Angels in Marble: Working Class Conservatives in Urban England. BY ROBERT MCKENZIE AND ALLAN SILVER. (Chicago: The University of Chicago Press, 1968. Pp. 295. $11.00.)

At the outset of the era of mass electorates, Disraeli became the prophet of working class conservatism. As Prime Minister and leader of the Conservative Party he mobilized a reluctant parliamentary majority to support the Second Reform Bill (1867) which granted the franchise to the British working class. Disraeli successfully overcame grave Tory misgivings by arguing that the Conservative Party surely would benefit politically if it played the major role in transferring potential control of the machinery of government to the industrial masses. For its efforts in this "betrayal of the status quo" John Stuart Mill branded the Conservative Party—a party whose members consistently had been drawn from the upper strata of society and whose concerns had been to resist any basic transformation of the political power structure—as "the stupid party."

Time has demonstrated the accuracy of Disraeli's prediction. Since 1885 there have been fifteen elections in which one party won a clear majority, with the Conservatives winning eleven and the Liberal and Labour parties splitting the remaining four. In most of these cases, even in recent decades, "about one-third of working class voters for the two major parties have supported Conservative candidates." Thus, for nearly a century a sizeable portion of the British working class has been the guardian if not the guiding angel of the Conservative Party.

To discover why the urban working class has contributed so heavily to Conservative Party electoral strength, McKenzie and Silver combine three kinds of interpretation: historical, qualitative and quantitative. The historical perspective is provided in Chapter 2—"Conservatism and Its Appeal to the Working Class." Here the authors describe the Conservative Party's efforts to appeal to the working class on the basis of the party's record of initiating and/or improving laws affecting the working class's own self-interest. The central theme of this political communication has been the special ability of the Tories to govern the country and their competence in managing the economy for the benefit of the working class. These aspects of Conservative ideology have been more widely and successfully diffused than is suggested by the fact that only a third of the working class typically support Conservative candidates. While Labour voters readily endorse the Labour Party as the agent of the class interests, they also concede that the Conservatives are generally more qualified and competent to deal with most domestic and international policy domains. Working class Conservatives rarely accord such favorable judgments to the Labour Party. The singular attraction of Labour is "its reputation for concern for the common man . . ." Thus, the Conservative's historical claim of competence in governing appears to be widely acknowledged by the entire working class regardless of partisan preference.

The successful appeal by Conservative elites to the working class is the underlying theme of the remaining four chapters which constitute the core of the study. The analysis is based on data acquired in a four-phase, modified panel survey of urban workers employed in manual occupations. The interviews were conducted between 1958 and 1963 in what the authors term " 'non-electoral' situations." By minimizing short-term stimuli associated with political campaigns, McKenzie and Silver sought "to explore the enduring matrix of attitudes, values, and social characteristics which predispose voters to support one or another party"—a strategy which American studies might well adopt. They interpret their data with both skill and clarity. In terms of social characteristics, for example, working class Conservatives do not differ markedly from those who support the Labour Party (Chapter 3). Both groups also share many of the same social values and political perspectives (Chapter 4). But when Conservative voters are separated into "deferentials" (about a fourth of the Conservatives see the leaders of that party as the "natural rulers of Britain" and as the "sole source of whatever benefits are possible to attain") and "seculars" (better than a third of the Conservative voters evaluate their party on the more pragmatic basis of present performance and the prospects of future benefit), the groups do differ in their social characteristics (Chapter 5) and in their attitudes on social and political questions (Chapter 6). A final chapter summarizes the major findings in terms of the context, nature, and prospects of working class Conservatism in England.

In analyzing their data McKenzie and Silver detect changes in the social and ideological nature of working class conservatism. The social deference which has traditionally sustained the political preference of many working class conservative voters apparently is being displaced as the younger and better paid working class members gradually adopt a more secular political outlook. But how and why these changes are occurring is not fully explained. McKenzie and Silver are not sure how stable this change will be or how it will affect the partisan balance in the immediate future. They readily admit that the accuracy of their speculations are contingent on future political events. Another Labour victory, for example, "may greatly diminish the disposition of a considerable section of the working class to attribute unique government skills to the Conservatives." Likewise, a Labour defeat could reinforce working class deference toward the Conservative Party. In short, McKenzie and Silver conclude that British political alignments are in a state of flux and wisely conclude that future electoral outcomes will have consequences that are more far-reaching than simply determining who shall govern in the short-run.—EDWARD C. DREYER, *University of Missouri, St. Louis.*

Chinese Communism in Crisis: Maoism and the Cultural Revolution. By JACK GRAY AND PATRICK CAVENDISH. (New York: Frederick A. Praeger, Publishers, 1968. Pp. 279. $6.00.)

Both the general reader, for whom the book is primarily written, and the specialist are indebted to the authors for this excellent study of the Cultural Revolution. The specialist will find little new information, but this book will provide him with

new insights into the complexities of Chinese politics; moreover, the work will serve as a convenient reference for the leading events in this perplexing period in Chinese history.

For the reader with little background in modern Chinese history, the first chapter is indispensable for a proper understanding of the problems confronting the Chinese Communists upon their advent to power. In the following chapter the authors analyze in chronological order the policies adopted by the leaders of the CCP to cope with those problems. In retrospect, it is now clear that the conflicts at the top echelon of policy-making were far more intense than Western observers had suspected. Certainly a broad consensus did not exist regarding the adoption of the Commune system. If one can believe the allegations made by the Maoists against the "anit-Maoists," such party stalwarts as Liu Shao ch'i led the opposition forces. Since Gray and Cavendish contend that the fate of the Commune is the essential issue in the Cultural Revolution, they analyze in depth the "great debate" preceding the adoption of the decision to undertake the total mobilization of the manpower and womanpower of China.

The authors' treatment of the "Thought of Mao Tse-tung" is not entirely satisfactory. Their analysis of the concept of contradictions fails to convey to the general reader the actual meaning and the centrality of this concept in the Maoist world view. It is doubtful that such a reader could sense the virtual adulation of the "laws" of the dialectic demanded of the "95 per cent" who allegedly follow faithfully the teachings of Chairman Mao. The writers' contention that the idea of contradiction "compels to a habit of analysis" (p. 59) is also the dubious validity. Would it not be more accurate to say that the Maoists urge that the dialectic be used as a tool of analysis by those investigating problems in all realms of existence? In short, Communists *should* habitually analyze situations in light of the theory of contradictions. Nor can I accpet the authors' characterization of the concept as a "mnemonic formula" that was "useful to a political leadership composed of a mass of village cadres and former querrillas who are politically unsophisticated and mostly subliterate," but who may not, as they grow more literate, need this tool of analysis. How can Mao and his associates lay aside the theory without doing violence to the myth that the dialectic is the most dependable "weapon" of the Marxist confronted with any problem?

The assertion of the authors that Mao, unlike Stalin, has taken a consistent position regarding material incentives is subject to question. Was his stand in the early stage of the Commune period vis-a-vis the relative weight to be given "material" and "moral" incentives identical to that taken by him before the shift in economic policy? The addition of the free supply system to the system of material incentives was based on the assumption that the CCP was building socialism so rapidly that it must prepare immediately for the transition to communism. Mao, in the early stage of the Commune period, placed less stress on material incentives and more emphasis on moral incentives. Similarly, Mao, in his struggle with Cultural Revolution foes, is waging a relentless attack on those who place too much weight on material incentives.

The last two chapters dealing respectively with the cultural and political aspects of the crisis confronting the Chinese Communist leaders are doubtless those that will be of greatest interest to the general reader. The authors demonstrate most effectively that the Cultural Revolution as commonly understood was a continuation of campaigns begun in the early and mid 60's (the Socialist Education Campaign, for example). They are to be commended for their delineation of the issues and objects of attacks in these campaigns. Their explanation of the reasons underlying the attacks on certain plays, operas, and films is especially valuable. Equally impressive is the dispassionate manner in which they evaluate such acts of the Maoists as the formation of the Red Guard Movement as the principal instrument for smashing the "main" enemy, the bureaucracy. Those reading this well researched book will gain a clearer picture of the principal figures, trends, and issues involved in this most confusing period in Chinese history because the authors place them in the proper historical perspective.

Enhancing the value of the book is a documentary appendix consisting of representative literary texts and doctrinal and national policy texts. The collection would have been strengthened by the inclusion of the "three constantly read articles" ["Serve the People," "In Memory of Norman Bethune," and "The Follish Old Man Who Removed the Mountains"], all "required" reading in Mainland China.—CECIL JOHNSON, *Southern Methodist University.*

Black Intellectuals Come to Power. By IVAR OXAAL. (Cambridge, Massachusetts: Schenkman Publishing Company, Inc., 1968. Pp. 194. $7.95.)

Social Change and Images of the Future. By JAMES A. MAU. (Cambridge, Massachusetts: Schenkman Publishing Company, Inc., 1968. Pp. 145. $5.95.)

The Sociology of Political Independence. By CHARLES C. MOSKOS, JR. (Cambridge, Massachusetts: Schenkman Publishing Company, Inc. 1967. Pp. 120. $4.95.)

The publication of these studies of the British West Indies, based on field research completed during the early 1960's, essentially completes the major efforts of the U.C.L.A. West Indies Study Program. These books extend geographical coverage of the study of social and political development to the Caribbean. While the populations and territories discussed are small compared with other newly independent nations in Africa and Asia, the setting in no way diminishes the theoretical utility for social science of the substantive findings. Furthermore, these studies help fill a geographical void in our learnings about the "developing nations."

The respective modes of analysis and exposition differ. Oxaal, reflecting his journalistic background, provides an extremely well-written, entertaining (an adjective which could be profitably attached to more studies of politics), lucid description of the events leading to independence in the multiracial setting of Trinidad. The development of party politics—Dr. Eric Williams' Negro supported Peoples National Movement and the East Indian supported Democratic Labor Party now headed by Dr. Rudranath Capildeo—is a dominant theme. A lesson of ethnic politics is that numbers are supreme. The D. L. P. was defeated because the Indian population comprises only 36 per cent of the island's population.

Oxaal contributes to our understanding of the phenomena of social and political integration in multi-racial, developing societies. On page 178 he observes that "color tended to diminish in actual importance in determining mobility as educational opportunity and achievement increased over the years." Although color has declined as a social and occupational barrier in recent years, ethnic voting has increased. Therefore, Trinidad can be described as a society exhibiting politically disintegrative tendencies, even though social mobility and social integration has risen from much lower levels, particularly for dark-skinned Trinidadians who previously lived under a color bar.

In contrast with Oxaal's historical and descriptive style, both Mau and Moskos attempt systematic social science, basing their analyses mainly on the responses obtained from elite interviews. Mau's study is limited to Jamaican leaders and one mass group in Kingston, whereas Moskos interviewed leaders in Dominica, Barbados, Grenada, Guyana, Jamaica, and Trinidad. Both selected their elites using a combination of positional and reputational criteria. Persons in high positions were asked to identify influentials by reputation. Those named comprised the units of study.

Mau sought to analyze attitudes held by elites toward the various social, economic, and political changes which characterized Jamaica during the transition from colony to independent nation. Leaders who professed belief in egalitarian principles, exercised decision-making power and who were knowledgeable of the complaints and discontents of lower class West Kingston residents were generally optimistic about the prospects for progress. Furthermore, these leaders identified the masses as hostile in much smaller proportions than leaders less egalitarian, less powerful and less knowledgeable. Thus Mau concludes favorably for the future of Jamaica. More than half the leaders interviewed expressed belief in Jamaica's future potential for progressive change.

Moskos investigated the development of West Indian nationalism during the pre-independence period in the British Caribbean. His format first describes the elite structure in the West Indies followed by the results of a series of interviews held with West Indian leaders. A typology of nationalist leaders was constructed (colonialist, acquiescing nationalists, and true nationalists) and correlated with (1) standard background characteristics (sex, age, education, color and ethnicity, personal wealth, life-style, and institutional sector; and (2) the economic, political and social views of these leaders.

Moskos presents several substantive findings: (1) West Indian leaders are better educated, wealthier and possess life-styles markedly different from that of the general population; (2) nationalism is a function of territorial size, i.e., leaders in smaller islands are less nationalistic; (3) colonialist types are in economically dominant positions and often white or near-white, while true nationalists are younger and more provincial West Indian middle class; (4) true nationalists express "left" economic ideologies, colonials profess "right" economic ideologies, while the acquiescing nationalists admit to intermediate economic ideologies; and (5) nationalist movements in the West Indies exhibit properties comparable with movements which have occurred in Western Europe.

Methodologically, Mau and Moskos suffer from inadequate samples. Mau's analysis of Jamaica is based on 54 interviews and Moskos relies on 112 total interviews from six different territories. The small samples restrict the statistical analysis to an almost uninteresting simple distribution of percentages, which often lack meaningful theoretical motivation. Controls are not applied to the data since the *n's* in the cells would quickly diminish to zero. For instance, Table 22 in Mau's book gives a percentage breakdown of knowledgeable leaders by type of elite position even though the number of cases on which the per cent is based ranges from 8 to 13. A change in the responses of only a few leaders could reverse the findings. Thus, the reliability and utility of most of the tables is sharply diminished. Furthermore, tests of statisti-

cal significance are not reported, nor is an explanation provided to account for their absence. Similar criticisms apply to Moskos.

One may question whether it is fair for Moskos to combine his 112 respondents for any analytic purposes. His findings that leaders living in larger territories tended to be more nationalistic than those in smaller territories may be inconsistent with assessing the correlates of nationalism for all leaders taken together without a control for territorial size.

Methodological shortcomings may prejudice the acceptability of the substantive findings reported in the latter two elite studies. However, the truth and generality of the findings are in principle testable in other locations and, properly verified, may aid our theorizing about nationalism and attitudes held by elites in newly independent nations.

It should be noted that these books in the Schenkman series are illustrated with splendid photographs and are reasonably priced. This series of reports provides an important beginning for the study of Caribbean political development.—ALVIN RABUSHKA, *University of Rochester.*

Kassenärzte und Krankenversicherungsreform: Zu einer Theorie der Statuspolitik. By FRIEDER NASCHOLD. (Freiburg i/B: Rombach, 1967. Pp. 288.)

A German student of interest group politics is confronted with a greater variety of problems than his American colleague: the prevalent idea that pressure politics is dirty, illegal or even subversive; the relative scarcity of empirical studies; the legalistic tradition that informs much of West German political science; and the need to import "Anglo-American" group theories as models for German case studies.

In light of these problems, the present book on medical politics is a considerable scholarly achievement. It deals with one segment of organized medicine: the health insurance physician and his main organization, the KBV; his attitudes toward statutory provisions; and his perception of the physician's predicament in a pluralistic welfare state. It discusses the relationship between the KBV and other medical associations; the KBV's decision-making processes and oligarchical leadership; and its access to the political authorities.

Organized medicine cannot be treated in the same way as workers' or employers' groups: the latter operate more or less autonomously, engaging in "political" activities to promote essentially economic goals; while the former is basically professional in its aims, and hence apolitical. Such a view of the medical profession, which the author supports with (not entirely convincing) statistics on comparative professional attitudes, precludes an analysis of medical politics in terms of marxist theory or bread-and-butter aspirations, and explains why he concentrates on status politics. The author admits that status politics is elusive, incoherent and often ineffectual, owing to unrealistic and conflicting ideologies and status perceptions, including the "estate consciousness" of the profession; the glorification of the traditional GP; the view of the physician as scientist, public servant or entrepreneur; and, finally, the flight into "the ideal of the essence of being a physician" (*das eigentliche Arztsein*)—whatever that may mean. The progressive nationalization of medical care has led to a transformation of the status and role expectations of the doctor. The fee system and the doctor-patient relationship have become dependent on the dynamics of statutory health care programs and on the general economic situation. The physician in "socialized medicine" is no longer free, nor is his status based on professional mystique. This dependence has, of course, not been entirely unwelcome: physicians want to be institutionalized not only because rendering a public service appeals to their sense of professionalism, but also because they gain a secure clientele and a guaranteed income.

For a long time, the medical profession remained politically passive, because its conflicting ideologies and organizational fragmentation weakened its cohesion and because the professional self-image required an apolitical stance. All this changed dramatically in the late 1950's: the health insurance reform bill, which envisaged an administratively determined fee schedule, threatened to transform the physician into a minor bureaucrat. The threat to medical apoliticism resulted in "status polarization" which transformed the profession into a cohesive force and enabled it to employ "political" means. But the physician can have his cake and eat it: he maintains his apolitical pose but transfers political responsibility to the organizational physicians "who are less socialized on the basis of medical norms." Ultimately all doctors must become political, in order to counter any acute threats to their apolitical status.

Unfortunately, the author tends to think of "political means" in terms of parliaments, electorates and parties. If politics is construed more broadly, the medical profession has always been political, despite its argument that its intervention with the bureaucracy and similar activities prior to "status polarization" merely constituted an exchange of objective information.

A more serious problem is the author's rejection of the financial in favor of the "status" hypothesis. While he admits that the privileged status and the entrepreneurialism of many doctors have been "dysfunctional with respect to the health care re-

quirements of society as a whole," he does not conclude that doctors are as interested in exerting pressure for monetary gain as other groups; he does not adequately analyze the medical associations' quest for the retention of bargaining powers, or their interest in keeping the health insurance funds fragmented to avoid being confronted with a united opponent; or the demand of specialists for better fees than those received by GP's. The author does admit that there has been "a decline of the spiritual outlook of the doctors," but he attributes this not to the profession's cupidity but rahter to "the dominance of materialistic attitudes in man." Had money been an important consideration—so the author argues—the physicians would have favored, in the early postwar period when medical pay was relatively low, a *Verbeamtung,* i.e. civil service status. But then civil servants were paid badly, too. Moreover, if the preference of status to income were so compelling, the doctors should have welcomed an incorporation into the bureaucracy, since status and psychic income have often been more important to bureaucrats than real economic advantages. In fact, the health insurance physicians have sometimes found "governmentalization" to their advantage, because public-law status has conferred the label of legitimacy and objectivity upon their demands.

One may also question the author's thesis that the threat to the doctor's image produced an effective status polarization and cohesion. The internecine fights between medical associations continued at the height of the medical reform struggle; one medical group brought suit against another, and new medical associations fought each other over fee distribution. Furthermore, one may question the author's contention that the status politics of the physicians represents a deviant case. The white collar sector has long striven to preserve its status and organizational identity despite the economic disadvantages it has thereby encountered.

There are a few minor shortcomings: no adequate discussion of the linkage between the KBV and the federal medical chamber, of the importance of medical journals in politicizing the doctor, or of the dynamics of medical pressure on the political decision-makers. The many complex details about the development of medical statutes, organization, and attitudes are impressive, but despite the marshalling of group and status theories—which precedes the factual analysis without necessarily clarifying it—medical politics is treated as a case *sui generis,* and no general principles emerge with respect to West German group politics. What makes it difficult for the reader to follow the book is its organization: it is not divided into chapters but rather scores of numbered, often brief, paragraphs—as in a legal text; the author switches back and forth in his analysis, which remains indicative rather than fully developed. Finally, there is no index. Hopefully, however, this book will contribute useful raw material for future attempts at generalization about interest groups.

Constructive Change in Latin America. ED. BY COLE BLASIER. (Pittsburgh: University of Pittsburgh, 1968. Pp. 243. $7.50.)

The French have an appropriate term for describing this sort of non-book: *macédoine,* "a work composed of diverse pieces forming a disparate whole." Beyond their common regional focus and the fact that they were all presented to the same faculty seminar at the University of Pittsburgh, there is little the editor can use to justify the joint publication of these original essays. Prudently, he leaves the provocative title concept, "constructive change," undefined. Unconvincingly, he argues that all the authors share a common preoccupation with the lot of the lower classes and with the need for consensus to accompany social and economic transformations.

Multi- or Interdisciplinary relevance is the usual justification for such a compilation. The seven authors do represent a variety of approaches and disciplines: anthropology, economics, sociology, political science and literature—but each stays strictly within the confines of his professional specialization. Merely juxtagposing their isolated efforts, however competent, does little to meet the stated objective of overcoming "the excessive compartmentalization in teaching and research that has handicapped the development of Latin American studies and knowledge in general." Rather, it underscores its persistence.

One of the more unfortunate consequences of a *macé-doine* is that, amid the disparity in quality and diffuseness of scope, essays of major significance get overlooked. In this format they are initially less widely distributed than a well-placed journal article and subsequently less likely to be reprinted. The essay by Fernando Henrique Cardoso and Josá Luis Reyna, "Industrialization, Occupational Structure and Social Stratification in Latin America" is, I believe, of such stature. The two authors, one a Brazilian, the other a Mexican sociologist, but both formerly associated with the Latin American Institute of Economic and Social Planning (ILPES) in Santiago de Chile, take on a major and hiterto unexamined issue: Is the development process in Latin America repeating the same basic patterns of structural change which characterized the evolution of today's older industrialized societies? Their answer is a qualified negative. By extensive resort to aggregate data on the

major countries of the area, Cardoso and Reyna document a number of significant deviations from the Western Europe-North American pattern: (1) Urban growth precedes and far surpasses that of industrial growth; (2) While movement out of agricultural pursuits parallels that of the "early take-off countries", proportional employment in industry is much lower and shows marked signs of stagnation; (3) The great absorber of newly mobilized urban manpower is the tertiary sector—an omnibus category which disguises the existence of a growing proportion of economic marginals. The resulting configuration is paradoxical: on the one hand: the gradual formation, increase and consolidation of a proletariat and other modern status groups based on relatively open, performance-oriented criteria and values; on the other hand, the more accelerated growth of undifferentiated, underemployed and unassimilated urban masses, "recruited" by geographic mobility and rapid demographic growth and only latently "available" for participation in the values and institutions of a modern industrial society. This configuration differs markedly from that of industrializing Europe and while its bloated tertiary resembles that of contemporary post-industrial societies, it lacks the latter's high level of productivity. From this stratification model, the authors launch into some speculative propositions about elite responsiveness and persistence, social mobility, class conflict, fragmentation within lower strata and center-periphery relations. While the authors' imagination clearly outruns their data—itself of questionable reliability and comparability—their essay represents a major effort at understanding the Latin American development process in a critical, but nonpolemic Marxist perspective.

The remaining six essays are of lesser originality and general relevance. John Gillin discusses the values of the lower classes in a rather vague and quite undocumented sequel to his earlier and much reprinted essay on the middle class ethos. John Powelson takes a long time to make a simple *Hirschmanesque* point about the ECLA doctrine: that ideologically deformed, empirically unfounded (in his opinion) economic analysis may result indirectly in more appropriate and effective policy sequences than objective, correct (i.e., North American) economic analysis. Both place great emphasis on values and the need for consensus over them, but in their compartmentalized way seem unaware of the survey research work of scholars such as Joseph Kahl on Brazil and Gabriel Almond and Sidney Verba on Mexico.

Two essays deal with the perennial issues of private foreign capital and the Alliance for Progress. Neither contributes anything new to the discussion, conceptually or substantively. Richard Thorn's summary of the fortunes of the Alliance for Progress, for example, starts like a State Department press release, switches to the hard-hitting, disjointedly factual style of the Annual Reports of the Social Progress Trust Fund and concludes with the usual lament over the lack of a political will to implement reforms at the national level, a plea for more effective salesmanship on the part of intellectuals and a call for the establishment of a Great Power Executive Committee with United States participation to guide regional integration!

Germán Arciniegas provides an erudite—if controversial—reminder that students of Latin American politics stand to learn as much from the area's literature, "a humanized form of polemics," as from "Marxist babblers (who) have picked up the phrase, 'structural change' and are applying it with rigor as an easy answer to any solution."

In the final essay, James Malloy draws a concise and objective political history of the Bolivian revolutionary experience, but cast in a conceptual framework clearly intended to provoke comparison. He orients his account around a number of interesting working propositions about both the pre-revolutionary dilemma and the post-revolutionary process of reconsolidating central authoritative control. Unfortunately, in this short format, the exposition is much longer on inference than systematically compiled evidence. It does, however, set a promising standard for the fully-documented study of which it is a résumé.—PHILIPPE SCHMITTER, *University of Chicago.*

Communism in Malaysia and Singapore: A Contemporary Survey. By JUSTUS M. VAN DER KROEF. (The Hague: Martinus Nijhoff, 1967. Pp. 268. $11.30.)

This is a highly informative and insightful survey of Communist organizations and activities in Malaysia and Singapore with primary emphasis on the 1963-67 period. After a succinct discussion of various stages of Communist activity in this area, the author analyzes specific problems and prospects in each territorial unit—Singapore, Malaya, Sarawak, Sabah and Brunei. Special attention is paid to the pattern of Communist tactics applied in the processes of formation and disintegration of the Malaysian Federation. And the author evaluates the consequences of Indonesia's erstwhile "confrontation" campaign against Malaysia and of Communist China's policies in Southeast Asia.

The fact that Communism in the Singapore-Malaysian area is almost entirely a Chinese phenomenon is deeply rooted in the persistent ethnic and cultural identity of Chinese groups. Although they enjoy commanding economic positions and high educational development, a variety of their

communal grievances, coupled with their chauvinistic outlooks, become a fertile soil for Communist appeals and operations. In Malaya the Chinese, as "second class" citizens, suffered most from discriminatory measures in such fields as citizenship regulations, business licenses, governmental recruitment, language requirements and public assistance. In recent years Malaysia and Thailand concluded a frontier defense agreement and conducted the joint patrols to suppress the growing Communist guerilla activities along the border, given an impetus by a combination of Chinese communalism and ultra-orthodox Islamic currents. The Malayan Communist Party (MCP) fully exploited the Chinese grievances to maximize its revolutionary objectives and to further radicalize political dynamics along communal lines. Yet the heightened sense of communal differences tended to militate against ideological ties. Among leftwing Malays and Chinese, therefore, communal suspicions and tensions undermined common ideological commitments and destroyed a number of MPC's united front organizations and movements. In this sense, the author concludes, communalism is not only Malaysian Communism's greatest asset but also a major barrier to its success.

The fusion of Communism and Chinese communal interests is particularly effective in Sarawak. The so-called Clandestine Communist Organization (CCO), most significantly identified with Mao-tung's political doctrines, recruited a considerable number of young Chinese radicals and made a substantial penetration into Chinese communities. While the CCO and its front complex advocated complete national independence for Sarawak and instigated subversive activities, the Goverernment arbitrarily arrested suspects and resettled some Chinese into a more controllable area. This intensified atmosphere increased the possibility of a Communist insurgency of major proportions. In Sabah where Chinese radicalism was less evident than elsewhere, Communist activities were largely an appendix of CCO operations. But Chinese status ambiguities and grievances in Sabah contained a seedbed for political radicalism. In Brunei, however, A. M. Azahari, in apparent cooperation with the MP, opposed the Malaysian Federation, advanced the notion of a unified North Borneo state comprising Brunei, Sabah and Sarawak, and led an unsuccessful armed revolt.

The People's Action Party (PAP) in Singapore was once bipolarized between the moderate non-Communist faction led by Lee Kuan Yew and the radical Communist-oriented and communally minded faction influenced by the MCP. One reason for Tunku Abdul Rahman's acceptance of Singapore into the Malaysian Federation was to make the split of PAP complete and to contain MCP's activities in the island state. The PAP's leftwing faction established the *Barisan Sosialis* (Socialist Front) Party and appealed to labor unions, militant student groups at Nanyang University and chauvinistic Chinese communities. In the face of the Malaysian Government's suppressive measures, Singapore Communists adopted a militant strategy along the line of Peking's "revolutionary hard-line" and in conjunction with Djakarta's "saboteurs and guerillas." Although the author alludes to the MCP's control over the PAP's leftwing and later over the Barisan, he fails to clarify the extent of the MCP's control, either organizational or financial. Moreover, such crucial aspects of the MCP and the Barisan as internal organizations, ideological assertions and leadership techniques are left unclear. The term "front organization" is not defined in this book and thus vulnerable to abuse.

While the author often makes references to Peking's "militancy" and "expansionism" in the Singapore-Malaysian area, nowhere does he attempt a satisfactory examination of Communist China's strategies and tactics regarding this area. Unless such an explanation is given, it is difficult to accept that overt and organized support for the anti-Malaysian movement shifted from Djakarta to Peking in the wake of the abortive PKI-sponsored coup of September 1965 or that opposition to Malaysia was for Peking a kind of Asian test case of its ideological and tactical differences with the Soviet Union. And Professor Justus M. van der Kroef implies that a profound communal divisiveness, especially the basic clash of Malay and Chinese political cultures, continues to characterize Singapore-Malaysian political life and to promote the interest of Communist movement. But it remains to be seen whether most overseas Chinese will perpetually preserve a parochial and chauvinistic loyalty toward their ancestral homeland or will gradually develop a significant sence of attachment to their adopted countries.—CHAE-JIN LEE, *University of Kansas.*

Agrarian Reform in Colombia. By ERNEST A. DUFF. (New York: Frederick A. Praeger, 1968. Pp. 240. $14.00.)

The test of any case study is not only its validity but its relevance to an issue of general significance. Ernest Duff's study of Colombia's agrarian reform fairly well succeeds according to these criteria. In relating land reform to political processes, this book may serve as an admirable basis for other ones concerned with the politics of reform.

Chronologically and topically, Duff correctly distinguishes the legislation of land reform from its implementation. Although a number of prece-

dents nourished them, land reform measures enacted in Colombia in 1961 were facilitated by a unique constitutional arrangement (the *Frente Nacional,* which alternates executive power between Colombia's major parties), international pressures (most especially, the examples of other Latin countries, and growing American awareness of the issue), and "reformmongering" by able and principled politicians earlier described in Hirschman's book, *Journeys Toward Progress.* Once enacted, however, new issues arose—funding, administrating, staffing, and developing support for the enterprise. Duff praises the country's current president, Carlos Lleras Restrepo, for skillfully maneuvering the bill through Congress. He is also properly impressed by the imaginative activism of the Agrarian Reform Institute's first General Manager, Dr. Enrique Penalosa. But, by terminating his study in 1967, Duff unfortunately relates only an incomplete story. Has the Land Reform Institute overcome financial, technical, and political obstacles to become a viable institution within the framework of public and private agencies active in Colombian agricultural policy making? More time is needed for a definitive answer.

Perhaps this book's principal value to those concerned with political development is its simple but careful elaboration of alternatives within the rubric, "land reform." Many who earlier wrote about land reform were obsessed by the general theme and explained it as merely an "either/or" confrontation between large landholders and peasants. Duff devotes considerable detail to the political significance of expropriation and distribution procedures, colonization, marketing arrangements, credit programs, infrastructure projects, extension work, etc. The reader will gain considerably from Duff's first-hand knowledge of many earlier projects. He will, in sum, come to appreciate the complexity of the issue in Colombia and elsewhere.

Yet, the reader will not come away fully satisfied. Despite careful documentation, Duff relies too much on published material which often over-states particular views. Unfortunately, Duff does not construct a political basis (one which might relate demands and supports within the system) to consider the activities of various affected agencies. Repetitions of party positions contrast with the scarce information on interest groups—the army, landholders' associations, regional development corporations, peasant groups, etc. There is, for example, no discussion of how the Society of Colombian Agriculturalists has attempted to broaden its clientele in order to defend key interests. Reliable information on interest articulators in the context of any reform movement is, of course, as difficult to find as it is valuable to uncover.

Duff notes how neighboring Venezuela's reform has surpassed Colombia's, partly at least because of the way that country's political parties mobilized peasant support. Why haven't reform-minded Colombian politicians profited more from this experience? Could it be because of the "oligarchy" which some believe rules without competition in Colombia? Or might this failure be attributed to the lack of active political cadres within the reformist parties, the peculiar apathy of the Colombian peasant, or the legacy of *la violencia?* These questions are vital ones since their answers will suggest much about the hopes for reform not only in Colombia but in other countries as well. From the experience he has gained in writing this book, one can reasonably expect that Ernest Duff will ably explore them in the future.—WILLIAM J. BRISK, *University of New Mexico.*

The Emergence of Indian Nationalism: Competition and Collaboration in the Later Nineteenth Century. By ANIL SEAL. (New York: Cambridge University Press, 1968. Pp. 416. $11.50.)

At first glance, it may seem inappropriate that an historical work like Seal's should be reviewed in this journal and presumtuous of a political scientist to undertake the task. However, the author himself foreswears "spiritless historiography which clings to the particular and eschews the general" and sees in Indian history broader patterns of the encounter between European imperialism and colonial nationalism. For instance, he asserts that "all over the world, nationalist leaders have been formed out of government subordinates, men who put their working hours to good use in studying the mechanics of power, and devoted their leisure to studying the obstacles barring their own promotion." Furthermore, he employs some of the current jargon of political development such as "political mobilization" and displays the redundancy of statistical tables now expected in behavioral science. His chapter titles such as "The Political Arithmetic of the Presidencies," "The Rewards of Education" and "The Politics of the Associations" are also topical rather than chronological. Therefore it is fair to appraise his work as social science.

The general problem Seal sets for himself is how and why modern politics began in India when they did. "Modern" is never defined except tautologically in terms of the associations formed by the western-educated. His thesis is that the new elite created by the British to man the lower rungs of the imperial bureaucracy entered into a contingent collaboration with the foreing rulers for the sake of caste or communal advantage over other Indians, but then turned into critics when the demand for government jobs outran the supply. The uneven timing of development (and in this he sees the essence of historical analysis) be-

tween the coastal and interior regions of India provided the British with a series of collaborators as each new wave of horizontal and vertical mobilization intensified competition. Once alienated, the western-educated elite was more dangerous to the rulers than traditional foes because it could at least claim to represent all of India and could imitate more effective British modes of political debate and organization. They even invaded British domestic politics.

Seal's analysis is a kind of elitist-materialist determinism wihtout economic social classes. He bases this position on a controversial denial that British rule revitalized the Indian economy. What economic growth there was "was not sufficient to give Indian social classes based on economic categories." Instead, bureaucratic institutional change created the new elite drawn from the high status, but low income castes and therefore unlike the modernizing bourgeoisie of Europe.

The author's theses are not altogether novel except as applied to the communal split between Hindus and Muslims which ultimately led to Partition and the creation of Pakistan. He argues that the Muslim community despite its formal adherence to the ideal of Islamic brotherhood was no more homogeneous than the Hindus. Far from being backward and oppressed throughout India as those of its leaders claimed who collaborated with the British in order to obtain "reservations" in the civil service, the Muslims of Upper India were relatively better off educationally and in proportion of jobs held than the Hindu majority. Where the Muslim minority was disadvantaged, as in Bengal, this was due to poverty rather than religious prejudice as often alleged. Misrepresentation of the true Muslim condition he blames on an influential work, *The Indian Musalmans* by Sir William Hunter which, though culled from the context of Bengal, was the basis for many of the polemics on behalf of the two-nation theory (one Hindu, one Muslim). Seal disagrees with both the Indian Nationalists and the proponents of Pakistan by concluding that there was no nation at all in the subcontinent in the nineteenth century. While the tone of his presentation is determinist, implying the inevitability of the outcome (Independence and Partition), in a few places he hints that the communal split could have been avoided at this turning point of Indian history (1885) if Hindus and Muslims in the backward regions had recognized that they had more interests in common than with their co-religionists on the coasts. What he fails to stress is that Muslims in general were less inclined to be adaptable to western ways in the crucial decades because it was they who had lost most of India to the British.

The author of this volume displays immense scholarship of a kind many of our political science experts on political development avoid in favor of baseless and sweeping generalization. Seal asks the right questions, but doesn't quite push his conclusions to the level where they would lend themselves to comparisons with other cases of political mobilization in colonial areas. This suggests the need for a more fruitful partnership between the two disciplines informulating and executing such projects.—THEODORE P. WRIGHT, JR., *State University of New York at Albany.*

Urban Government for Zagreb, Yugoslavia. BY EUGEN PUSIĆ AND ANNMARIE HAUCK WALSH. (New York: Frederick A. Praeger, 1968. Pp. 151. $10.00.)

Yugoslavia—A Multinational State. BY JACK C. FISHER. (San Francisco: Chandler Publishing Company, 1966. Pp. 244. $8.00.)

The two books under consideration here, although they both concern themselves with Yugoslavia, are quite different both in approach and in effectiveness of analysis. The one (Pusic and Walsh, *Urban Government for Zagreb, Yugoslavia*) comes off as a quite routine, if not pedestrian, descriptive case-study of municipal-commune government in Yugoslavia. The other book (Fisher, *Yugoslavia—A Multinational State*) represents a solid attempt at a new and useful application of factor analysis to the well-documented phenomenon of regional variation in Yugoslav society.

The book by Pusic and Walsh is one in a series of case-studies of urban government under the auspices of the Institute of Public Administration in New York that includes municipalities of various countries. The authors open with an introductory chapter outlining the basic environmental contours of Zagreb; this is followed by a discussion of the institutions of government in their formal and structural aspect; then we have a chapter on inter-governmental relations that analyzes the different levels of administration; there is a chapter dealing with the process of social and economic planning in Zagreb; and, finally, a chapter is appended that describes assorted public service functions performed in the city. On the whole, the authors' style strikes me as plodding, quite unimaginative, with a high redundancy of terminology, a style not untypical of much writing in the field of municipal administration. One has to be either very interested specifically in Zagreb or in the details of municipal government to be stimulated, moved intellectually, or absorbed by the material that the reader is expected to digest. Despite these qualifications as to presentation and style, the Pusic and Walsh volume affords a very adequate, and indeed convenient, manual-type description of the functioning of municipal government in Yugoslavia. The book also affords insights into the spe-

cial nature of Yugoslav political institutions that derive from the Yugoslav innovations of decentralization and social self-administration (e.g., one conclusion points to the wide range of citizen participation in Zagreb as compared to the cities studied in other countries). On balance, I would recommend this book to anyone seeking a focused, straight-forward, and concise descriptive summary of local governmental institutions in Yugoslav society. In other words, this case-study treatment of Zagreb affords us a convenient handbook outlining basic aspects of local government (i.e., the commune, the municipality, the council system, etc.) that characterize the Yugoslav system of decentralized authority. For this reason, if not for its depth of analysis, the book represents a quite worthwhile and respectable piece of scholarly work.

The second book under review here by Fisher represents an impressive attempt to examine regional variation (and, more specifically, urbanization) by the application of contemporary quantitative methods. The author begins with two chapters that define the landscape for the reader in terms of broad societal-ecological features and historical aspects of Yugoslav society; then a chapter follows that presents some general indicators of economic growth and a factor analysis based upon aggregate variables for fifty-five Yugoslav cities to allow for comparisons of levels of development across the country; the next chapter focuses upon housing policy and housing conditions that exist in Yugoslavia, a chapter that fits a bit uncomfortably within the broader concerns of regional variation and economic growth; and, finally, the author devotes a chapter to the commune system which contains both descriptive materials and a factor analysis used to compare varying development-levels across Yugoslav communes. A word might be added here as regards the development of the volume—namely, somehow the assorted parts fail to mesh with one another as well as they might. In part this reflects the fact that Prof. Fisher has drawn materials for his book from several research tasks that he had completed earlier. Accordingly, he resurrects some of his descriptive work on Yugoslav communes that appeared a number of years ago in *World Politics,* and he also includes materials from a more specialized study of housing problems in Yugoslavia that has occupied him more recently. Prof. Fisher combines these two research efforts with his innovative application of factor analysis to aspects of Yugoslav regional development, and then rounds out the volume with two impressive introductory chapters to put more narrowly focused aspects of the book into perspective. The piecing together of a volume in this way (although commonly done) always leaves its effects upon the flow of the argument and the organization of the finished product. As a result, the Fisher volume comes off as being a bit disjointed, although none the less worthwhile and effective in its many other aspects.

In a more positive vein, the attempt by Prof. Fisher to apply factor analysis as a means of getting at regional variation by using aggregate indicators (e.g., age-groups, income-patterns, occupational structure, etc.) is the most interesting and most academically profitable aspect of the book. This use of factor analysis is not only appropriate but also imaginatively conceived, while being suggestive as regards a number of theoretical issues of development that go beyond the specific application of Yugoslavia. There are in fact two separate applications of factor analysis in the book—the one to the sample of fifty-five Yugoslav cities, and the other to the full array of communes in the country. Both are instructive and analytically informative standing alone and could easily be so justified; however, the relationship between the *different* factors that are derived from the two distinct operations is not made clear by the author. In addition, Prof. Fisher fails to indicate why different (although related) sets of variables are used in two separate instances of factor analysis, and what relevance this might have for his more general study of Yugoslav developmental and regional variation. It would have been useful if Prof. Fisher had defined in more explicit terms the exact nature of both the methodological and the theoretical relationship between these two applications of the factor analytic technique. Despite these reservations, I found that the use of factor analysis by Prof. Fisher as a means of ranking and defining communes along a broadly developmental (and, more narrowly, urbanization) spectrum to be both a fascinating and a fruitful application of the method. On balance, the merit of Prof. Fisher's work is reflected in the attempt to employ a new method of analysis to an essentially old and well-known problem that plagues the Yugoslav scene—namely, its severe and dramatic regional variation. And, it seems to me, that the author has indeed been quite successful in this application to the Yugoslav setting.

In general, Prof. Fisher concludes that a basically north-to-south regional variation exists in Yugoslavia and that, for example, one finds more urbanization in Slovenia, Croatia, and north Serbia than in other parts of the country. Although this hardly represents a startling finding as regards Yugoslavia, the fact that Prof. Fisher has given this a precise quantitative expression (i.e., he provides a concrete, operational measure of regional variation) does suggest that now "old" information is made available in more acceptable and

perhaps more usable form given current trends in soical science. As a result, in my view, this would represent an important step in the direction of improving our fund of knowledge about both Yugoslavia and the problems of economic growth more generally. I might add as a footnote that the large number of maps that Prof. Fisher has included in the book are also very useful and contribute importantly to the value of his work. In concluding, let me say that Prof. Fisher, in providing us with new data and expanded knowledge about regional variation in Yugoslavia, has made a significant contribution to the existing body of literature on Yugoslav society.—M. GEORGE ZANINOVICH, *University of Oregon.*

Russian Peasants and Soviet Power: A Study of Collectivization. By M. LEWIN. Trans. by Irene Nove. (Evanston: Northwestern University Press, 1968. Pp. 539. $11.50)

One of the key periods of Soviet history in general and the evolution of the Soviet political system in particular—up to now very much neglected by Western scholarship—is the period of acute crisis which followed the initial successes of Lenin's New Economic Policy. It was during this period that the Soviet leadership found itself at an important crossroads in the development of the "new Russia" and, being in disagreement over basic policy questions, could not agree on the directions.

Lenin had envisaged NEP as a phase in Russia's development toward communism which would last a long time. When in the years after 1927 the Bolshevik leadership saw itself confronted with the "accursed" problem of the relationship between town and country (or more pointedly: between the Soviet regime and the peasantry!), Bukharin advocated the continuation of more or less pure NEP measures; the exiled Left, while wanting to retain a market economy, favored rapid industrialization; Stalin, who by this time was in control, decided to solve the crisis—epitomized in the grain procurement problem—by ending NEP.

Lewin's study, spanning the years 1925–1930, was originally published in French as *La Paysannerie et Pouvoir Soviétique* (Mouton, 1966). It is the first full-length treatment in a Western language of this crucial period in Soviet history and a major contribution to our understanding of the events which led to the decision to transform the Russian *muzhik* (peasant) into a Soviet collective farmer, and to achieve this transformation, as well as rapid industrialization, at breakneck speed.

Dr. Lewin brings to his task not only meticulous scholarship and a rare mastery of sources, but also valuable personal insights and a unique feeling for his subject. The value of his study is enhanced by his own personal experiences in the USSR during 1940–1946, i.e., only 10–12 years after the events which he describes and analyzes in his book.

In the first part of his book, primarily devoted to the years 1925–1927, the author deals with the factors which led to the breakdown of NEP. He presents a lucid analysis of class stratification within the peasantry and a detailed account of the enormous difficulties encountered by the Soviet regime in its attempt to extend "Soviet power" to the countryside. Lewin argues that the heterogeneous character of the peasantry presented both theoretical and practical problems for the Soviet regime, whose initial policies were predicated on the assumption that the peasants could be readily classified into three categories, *viz.*, poor (*bedniaks*), middle (*seredniaks*), and well-to-do peasants (*kulaks*). The present volume leads to the conclusion that the ideological distinction made by the Soviet regime (and by Soviet historians) between the various segments of the peasantry concealed the real issue: the fact that the major obstacles confronting the Soviet regime in rural Russia could not be reduced to the existence of the *kulak* class, but involved the middle peasants, i.e., the vast majority. Lewin's subsequent analysis shows how Stalin turned the very vagueness of the concepts of *kulak* and *seredniak* into a political advantage. In fact, the author argues that for Stalin the terms *kulak* and *muzhik* came to be identical (p. 252).

In part II of the book the author interprets the years 1928–1929 as a kind of interlude during which the regime failed to develop a coherent long-range economic policy and attempted instead to deal with the procurement crisis of 1928 and subsequent problems through "measures of a partial and provisional nature." (p. 267). This is the heart of the book: a thorough and meticulously researched account of the events which "drove the Communist Party leadership to embark upon mass collectivization."

Part III deals with the "great turning point" of 1929—the "spinal year" (Krzizhanovsky's phrase!) of the first Five Year Plan—and with the Party's attempt to achieve collectivization on a mass scale through "dekulakization" in order to ensure the first "Bolshevik spring," as Molotov had put it in November of 1929.

Lewin suggests that the attack on the *kulaks,* which resulted in an outbreak of mass violence and brought the country to the brink of civil war, was motivated by the desire of the central leadership to coerce the middle peasant into believing that joining the collective farm was the only remaining alternative. Any opposition to collectivization and Soviet policy in the countryside in general came to be regarded as *kulak* activity" and was dealt with accordingly.

In the author's view, Stalin's decision to embark upon forced collectivization, coupled with a policy of continued rapid industrialization, took shape during 1928 and was dictated by an ever-growing economic crisis and by his maneuvers in the factional struggle, as well as by his personality. (The latter point is not well developed.) While Lewin may be right in arguing that collectivization "was not the outcome of long premeditation in the doctrinal sense" (p. 163), Stalin's political maneuvers during 1928 suggest that he probably had decided on his subsequent course of action as early as 1927—before the 15th Party Congress in December of that year. In fact, an examination of Stalin's views of the peasantry before 1927 reveals an extremely negative attitude (cf., e.g., Stalin, *Sochineniia*, vol. VII, pp. 28, 213; vol. VIII, p. 93), which hardly suggests a continuation of the regime's policy toward the peasants on the model of Lein's NEP. And while the author may be right in noting that the term *kolkhoz* (collective farm) does not occur in Stalin's writings before the 15th Congress, as early as June 1925 Stalin spoke of the necessity of organizing the millions of the peasant masses into cooperatives (*ibid.*, vol. VII, p. 157) and emphasized that the proletariat would have to wage a struggle not only against the *kulaks* but aginst the *peasantry as a whole*. (p. 173).

Perhaps Dr. Lewin has defined the explanatory parameters of his investigation somewhat too narrowly. His study would have benefited from a critical examination of the problematic nature of Lenin's concept of the alliance (*smychka*) between the proletariat and the peasantry, as well as by a thorough analysis of the character of the agrarian revolution of 1917. In general, Lenin's position on the peasant question does not emerge clearly in the book—in spite of the author's implicit recognition that Lenin *was* a participant in the "great debate." And the exposition of Bukharin's position is not without serious shortcomings. At times the author does not make clear whether Bukharin is expressing his own ideas or quoting Lenin.

Unfortunately, the translation of Dr. Lewin's work leaves much to be desired, especially in regard to grammatical construction. The general reader may object to the often excessive and unnecessary use of Russian terms, some of which are not explained, either in the text or in the glossary.—ROLF H. W. THEEN, *Iowa State University.*

Ethnic Minorities in the Soviet Union. EDITED BY ERICH GOLDHAGEN. (New York: Frederick A. Praeger, 1968. Published for the Institute of East European Jewish Studies of the Philip W. Lown School of Near Eastern and Judaic Studies, Brandeis University. Pp. 351. $8.75.)

Until now the nationality problem in the Soviet Union has not been considered sufficiently important to attract wider attention. Even books of recent vintage that survey the half century of Soviet development frequently brush off the consideration of this question. This neglect can be explained and understood, but can not be justified. The problem deserves close attention because the nationality policy is an integral part of Soviet development. It has considerably influenced the shaping of the Soviet system and has continuously affected the making of the Kremlin's policies. The Bolshevik solution of the national question decisively affected the establishment of the Soviet federal state. Stalin's decision that favored the development of a national Russian state as against a Soviet commonwealth of nations has added to the remaking of the Soviet Union from an originally intended revolutionary ideological power into an intensely ambitious imperialist nation-state. The resurgent non Russian nationalism now threatens this concept and, taken together with the general dissent demanding liberalization, presents grevious problems to the Kremlin rulers. Professor Brzezinski's recent suggestion that the national question in the Soviet Union represents one of the most explosive issues indeed is a good reminder of this empirically demonstrable yet unjustifiably disregarded fact.

The volume edited by Mr. Goldhagen, therefore, is the more welcome, because it signifies the growing recognition of the problem. It is not as all-inclusive and systematic as the editor suggests in the introduction (for example, Georgia should not be missing, the new developments of Siberia and autonomous republics are of utmost importance) and indeed the principle of the organization of the book is not very clear. Generally, it focuses on the phenomenon of non Russian self-assertiveness. The book contains five excellent, very well researched and documented articles that deal with individual nationalities. These cover the Ukraine (Yaroslav Bilinsky), the Baltic Republics of Estonia, Latvia and Lithuania (Jaan Pennar), the Turkic peoples (Garip Sultan), the legal situation of the Jews (William Korey) and the Yiddish *Sovetish Heimland* whose contents are analyzed with gusto by Joseph and Abraham Brumbergs. The other nationality studies, unfortunately, are not as instructive though they too offer some insights into the ambiguity of Belorussian nationhood (Nicholas Vakar), social change in Armenia (Mary Matossian) or the complexity of nationality consciousness in Central Asia (Edward Allworth). Generally, the authors maintain that with the exception of Belorussia, national assertiveness is strong among the non Russians, even among the Jews, whose cultural and religious life has recently

been, as Korey well explains, the most suppressed of all.

In addition to individual case studies, Mr. Goldhagen's book is valuable for discussions of broader issues. One of those is Jacob Ornstein's informative review of Soviet language policy. Another is John Armstrong's excellent analysis of Soviet nationalities in the Soviet system of power. There are of course alternative methods of dealing with the problem and one can legitimately question whether the functional model, even in the adjusted form that is used by Armstrong, is adequate for capturing the very dynamic, rapidly changing and complex process of Soviet nation building and indeed whether social communications indexes alone provide a sufficient basis for reconstructing a theoretical framework within which the Kremlin deals with its nationalities. This remark is not meant to detract from Professor Armstrong's accomplishment. His study is one of the very first in scholarly literature that examines the nationality development as an integral part of the Soviet system. The author thus elevates the study of Soviet "minorities" to the plane of an empirical analysis of the political system itself and his article is a "must" for any serious student of Soviet nationalities.

Finally, in a long but rewarding article Vsevolod Holubnychy tackles one of the most controversial questions in the field, namely, whether the Russians economically exploit the non Russian republics. In this very learned and well documented study the author uses a purely economic model to prove his thesis that economic exploitation constitutes the essence of Soviet nationality policy. The statistical evidence presented, however, is mostly limited to the Ukraine and is not as convincing as the wealth of material used suggests it would be. Holubnychy, however, has raised important questions, presented cogent arguments and thus has triggered off some overdue but very useful and badly needed discussion that might and should lead toward a better clarification of the role of economics in Soviet nationality policy. Too frequently this role has been either too narrowly understood or denied altogether.

Ethnic Minorities in the Soviet Union is a result of a conference that the Institute of East European Jewish Studies of Brandeis University had organized in 1965. Both the Institute and the editor of the book should be commended for its efforts and encouraged to continue such research.—V. Stanley Vardys, *University of Oklahoma.*

Communism and the Yugoslav National Question. By Paul Shoup. (New York: Columbia University Press, 1968. Pp. 308. $9.50.)

Among the countries in Eastern Europe, Yugoslavia appears to have the greatest mania for reorganization which currently embraces the political system, economy, and cultural life. Its communist party allegedly no longer will govern in the future but merely represent a guiding force. At least, such a change had been envisaged as far back as the July 1966 plenum of the Central Committee which met on the island of Brioni. The author of the scholarly work under review ends his coverage with this event.

Professor Shoup has had the great advantage of studying at the law faculty of Belgrade University, and his book is based on original source materials in the Serbo-Croatian language. In the thesis, he contends that "the Yugoslav national question today is very much part of the contemporary drama of nation-building and economic development now being played out in many parts of the world." (12)

Returning to intra-communist relations, for the moment, it is interesting to note the parallels between Comintern policy *vis-a-vis* the Yugoslav party and other parties in Eastern Europe. The author describes the former relationship in the background to his excellent study. Thus, after 1928 the Comintern called for peasant uprisings and in 1934 even ordered a policy of secession for Croatia, Slovenia, and Macedonia by communists in these provinces. Professor Shoup also concludes that already in May 1941 the "Yugoslav Communist Party was beginning to act independently of the Soviet Union and to conceal its actions from the Comintern, if only in matters of local importance." (p. 62) He also suggests that peasant nationalism during World War Two was based on hostility toward alien [i.e., German] rule. How many of the 3,000 communist secret police killed after that war can be blamed on the peasantry, which may have considered the victims "alien," is probably classified information at Belgrade.

Moving on to foreign affairs, the author discusses a proposed Balkan Federation, with Bulgaria envisaged as a seventh republic within Yugoslavia. This never materialized. Had the plan been implemented, then perhaps the current Macedonian dispute might never have arisen. Professor Shoup contends that solution of the nationality question for the Yugoslavs "could serve as a model for the newly developing nations of Africa and Asia with problems similar to their own." (pp. 188–189). The possibility of a single, amalgamated Yugoslave culture apparantly has been abandoned due to local resistance and the need to rely on more nationalistically oriented republics like Croatia and Slovenia in order to implement economic reforms.

In his conclusion, the author suggests that na-

tion-building in Yugoslavia may never be completed. "It is clear that one transitional phase, at least, has come to an end with the breakdown of the effort to create a new type of nationalism based on the quasi-communist, quasi-democratic institutions of Titoist Communism." (p. 265). The book includes valuable appendices portraying nationality statistics for the population, the Yugoslav communist party, republic communist parties; opinions about relations among the various nationalities; the national origin of key government and party officials; and an excellent bibliography.—RICHARD F. STAAR, *The National War College.*

Russia's Protectorates in Central Asia: Bukhara and Khiva, 1865-1924. By SEYMOUR BECKER. (Cambridge: Harvard University Press, 1968. Pp. 416. $12.50.)

Since Churchill's famous dicta on Russia, much firstrate research has reduced the enigma to more manageable proportions. Some riddles, however, remain to engage our attention. These would include aspects of the decision-making process at various elite levels, the succession problem, and the theory and practice of the regime's policies toward the nationalities; Professor Beck's book is a valuable addition to the growing literature in the latter field.

Russia's Protectorates does not attempt to address itself to contemporary problems of Soviet politics. Yet it explicates these through a detailed, scholarly, immensely readable history of the two Central Asian Protectorates. On clear aspect of Russian policy in Bukhara and Khiva is that, instead of the the stereotyped "Prison House of Nations," St. Petersburg followed enlightened policies. The two Protectorates did eventually succumb to Russification, as the more advanced Russian state brought the benefits of civilization, and as the frontier between British and Russian spheres was stabilized; but "civilization" came as the result of a more advanced state coming into contact with a relatively more backward one.

Thus Bukhara and Khiva became part of Russia through a process of attrition, in the manner of the old truism that power abhors a vacuum. Yet the sovereignty of the two Protectorates, with the exception of their foreign relations over which they lost control at an early stage, was ended only when the Bolsheviks seized their territory as an aftermath of the Civil War. Another myth is shattered along the way: the Russian Governors in Central Asia were able, competent, far sighted men. Their policies were usually supported by St. Petersburg; when opposition arose, it came about either as a result of national preoccupation elsewhere, or local policy recommendations were ultimately adopted. But let Prof. Becker summarize the ultimate causes of Russification:

> In short, Russia was spurred on in Central Asia by a whole complex of motives—the quest for a secure frontier, the provocations offered by unstable neighbors, the fear of being excluded from the area by England, and the temptation of diplomatic leverage, economic profit, and military glory. (p. 23)

Advanced nations cannot expand their influence into less developed territories without eventuating political change. The coming of the railroad and telegraph first brought enclaves for the citizens of *Russia,* then granted them extraterritorial justice and law. These changes, beginning in the 1880s, were *ad hoc;* just the same they slowly, imperceptibly, but profoundly, changed the relationship between St. Petersburg and the Protectorates. If the latter retained their *de jure* independence, it was only because the Russians so willed it. In actual fact, both Bukhara and Khiva became dependencies; their respective rulers attempted to oppose the new trend, and to retain their previous personal perogatives. In this they were ultimately unsuccessful. They were, however, able to retard the process.

Nor was Russian policy consistent. A long period of neglect—or, more accurately, a period of classical *laissez faire* on part of the Russian state—came between times of active interest in the Protectorates. Becker gives a detailed analysis of economic, military and political factors in the changing relationships. The Russian regime was not to be rushed into colonization. The reason soon became clear:

> St. Petersburg did the inescapable minimum to protect and promote Russian private interests in the khanates and acted to restrain those interests when they threatened the foreign ministry's policy of non-intervention. Concern for her own strategic position was more important to official Russia than were the economic interests of her own subjects. (p. 191).

Nevertheless, Russian technology slowly gnawed into the Protectorates' independence. Even though the policy of Russification was renounced, the Russian presence inexorably led to loss of local autonomy and privileges.

After the turn of the century, however, the pressures toward greater Russian influence became increasingly hard to resist. New local rulers, especially in Khiva, lost the awe in which their fathers had held Russian military prowess. Rebellions against "foreign" rule multiplied. Successive defeats of the rebels drew the Russians ever deeper into local administration of the Protectorates. These trends suited the Leninists; after the defeat of the Whites, the region was gradually absorbed into the Soviet Union. Anti-Soviet activities and opposition to the Red Army in the Civil War may have hastened their end as semi-independent

states; but it is unthinkable that the old dispensation could have endured into the Stalinist period.

Professor Becker has written the definitive work of Bukhara and Khiva during the period discussed. This reviwer might wish that more attention had been devoted to foreign affairs (which he hopes Prof. Becker will cover in a subsequent volume), and the price, which will confine the book to libraries and specialists. All those with an interest in cultural and political history are urged to take this truly excellent work, both scholarly and exciting, from the shelves. Good maps, bibliography (exhaustive, and exhaustively read and skillfully applied), glossary of terms (essential to a work of this nature), adequate index, pertinent treaties given in appendixes, aid the reader and add to his enjoyment.—PETER MAYER, *Westinghouse Electric Corp.*

Architecture and Politics in Germany, 1918–1945. By BARBARA MILLER LANE. (Cambridge: Harvard University Press, 1968. Pp. 278. $15.00.)

The politics of culture is a new topic for most political scientists. Although other problems of social policy often seem more pressing than those relating to the arts, cultural and aesthetic questions are being inscribed on the agenda of public concerns in increasing numbers. Barbara Miller Lane's book, *Architecture and Politics in Germany,* 1918–1945, is the kind of work on which the study of politics and culture will thrive. It is thoroughly researched, beautifully illustrated, and a paradigm of objectivity—especially important in the chapters on Nazi architecture, usually dismissed as "piles of unwiedly blocks," or an "endless repetition of dead forms."

A major theme of this study is that in politicizing architecture, the Nazis were not fulfilling some imperitive of a fascist form of political organization but carrying on a tradition begun in the twenties. The most detailed chapters of the work are devoted to the two political disputes which resulted in the exiling of the Bauhaus, haven for radical architects in the twenties, from Thuringia to Dessau in 1924, and finally in its permanent dissolution in 1932. Using the large collection of material from Walter Gropius' personal archive, the author draws a vivid picture of the artistic ferment in Wiemar Germany. Radical architects, under the leadership of Groupius and Bruno Taut formulated their goals in clearly ideological terms. They sought a "new totalism" through the medium of a socially conscious architecture carried out by men washed of traditional ideas by submission to a new regimen of courses in abstract design, form and color. The first "Battle of the Bauhaus" pitted these architects against local politicians who accused them of foreign influence, cultural decadence, and "art bolshevism."

After 1924 the argument shifted somewhat for with the new prosperity proponents of the international style found themselves favored with many commissions. In Frankfort Ernst May constructed large tracts of public housing in the new style, and building societies such as the Gehag brought the new ideas to Berlin. But with national prominence came national enemies. Paul Schultze-Naumberg led the enlarged opposition by reviving claims that the new style fostered racial decline by offering the people a faulty "wish picture."

By the time the Nazis came to power in 1933, national opposition to the new architecture had been consolidated in the Kampfbund under the tutelage of Alfred Rosenberg. Soon, however, both Schultze-Naumberg and this group fell from favor, only their negative proposal (purging of the Bauhaus) being accepted. Sponsorship of architecture under the Nazis was never fully centralized. Under the leadership of its frustrated architect, the regime boldly proclaimed that its new building program would create a common will, foster a feeling of proud togetherness and contribute to political unification. Beneath the monolithic rhetoric, however several different styles flourished. Albert Speer's party congress buildings brought the strong simplifying impetus of the international sytle to a classical revival, Clemens Klotz enlarged on medieval themes in his design of party leadership schools, and a wide variety of minor party buildings were constructed in various regional folk idioms.

Readers will be rewarded by a special asset of this book, the excellence of its design and typography. The book is set in Nelior, a typeface with strong architectural elements, strong, column-like verticals and squared-off forms. Beginning and end pages are designed in forms reminiscent of the Bauhaus-style itself, and the body of the work is given interest by a scheme of organization which adjusts the masses of each page up- and centerward. The placement of the illustrations creates pleasing variations on this theme except perhaps on pp. 29, 91 and 124 where the compression of elements leads in other directions and tends to make for crowding. The book, however, offers strong encouragement to those resigned to finding mundane texts in beautiful books and worthy manuscripts in nondescript editions.

This study is a work of history. It would be wrong to complain that it contains little theorizing and no explicit models of personal behavior or political interaction. No enterprise of understanding can survive flaws in its assumptions, but history, unlike political science, can plead modesty in making a show of its theoretical framework. The

lack of explicit theory will tantalize political scientists, however. There are several indirect references to questions of space and behavior, for example. Nazi public housing projects returned to a "German" form of house plan with many small rooms form the plan popularized by radical architects which consolidated public rooms into a single area. Any comprehensive theory of architecture and politics will have to deal with the interplay of created environment and social behavior of the kind hinted at here. The dynamics of architecture as a political "issue area" provides another important theoretical viewpoint. This framework would ask, for example, whether the pluralism of building styles under the Nazis was inherent in the nature of architecture or a result of the "opportunism" of the Nazi regime. Evidence regarding the architectural programs of the other fascist regimes is becoming available and could be integrated into a larger theory of architecture and politics. It is a tribute to this book that it will be found not only on coffee tables and shelves of art books but in the working files of those interested in conceptual questions such as these. It is a work of many sensibilities.—W. CURTIS LAMB, *Yale University.*

Specialists and Generalists: A Comparative Study of the Professional Civil Servant at Home and Abroad by a Group of University Teachers. ED. BY F. F. RIDLEY. (London: George Allen and Unwin Ltd., 1968. Pp. 213. $5.00.)

The "professional" versus the "amateur" in administration continues to be a major concern of British public service. The Institution of Professional Civil Servants commissioned a study of the professional bureaucrat in Britain, Australia, France, West Germany, Sweden, and the United States to submit to the Fulton Committee reviewing the Structure, Recruitment and Management of the Home Civil Service. This volume, *Specialists and Generalists,* evolved from the submission.

Although the IPCS represents scientific, technical, professional and specialist classes in the British Civil Service and other public bodies, this symposium argues no case, but analyzes the role of the specialist in six governmental systems. Nevertheless, the study is prompted by the widely expressed fear that British administration is not coping successfully with the critical problems of a scientific and technological age. Professor F. F. Ridley, University of Liverpool, and co-author of *Public Administration in France,* directed the work of the group and contributed the introduction, summation, and excellent account of the professional in France. Other contributors were Dr. B. B. Schaffer, University of Sussex; Dr. Nevil Johnson, University of Warwick; Dr. H. Parris, University of Durham; and Professor R. H. Pear, University of Nottingham. The baseline paper on Great Britain was provided by T. H. Profitt, Deputy Secretary General of IPCS.

A study of this sort runs into problems of definition. What is considered generalist in one system may be specialist in another. Does education in political science, public administration or other social science, or in law, really produce a specialist for public service? To minimize different understandings of such terms as generalist, specialist, professional, administration, management, technology, etc., the studies proceed by illustrating the career ladders, pay and status, and access to politicians that may be expected by arts graduates, lawyers and jurists, engineers, scientists, accountants, and others in the various systems.

In the British context, both persons and functions are separated into generalist and specialist. Generalists advise Ministers, formulate administrative policy, and as Mr. Profitt states, control the Governmental machine. The professional carries out the work of specialist agencies under administrative and financial control of the generalist, and advises the generalist on policy. In Sweden, ministries function as policy-planning staffs and more routine administration is carried out by boards. In the other four countries, there is little structural separation of specialist or advisory work from general administration. In Australia, France, Germany, Sweden, and the U.S.A., the specialist and professional have greater opportunities at the top than in Britain. On the Continent and in Australia, some senior administrative posts are restricted to specialists. In particular, the Australian federal service is characterized by respect for specialists, and rights and opportunities for the professional are built into the structure of the service. The generalist-specialist dichotomy in British Civil Service is linked to the practice of selecting ministers, not for their expertise, but for their ability to make balanced judgments based on evidence submitted by experts. The senior administrator is expected to bring to the work of the department the same kind of judgment. Another important influence on the public service has been the generalist orientation of the British universities, where administrative class is recruited, and the development of technical education outside the universities. Certification in technical fields has been undertaken by professional and technical associations, and such certification often lacks the prestige of the university degree. The authors show that outside Britain, recruitment to the public service from "non-vocational" education is rare. As Prof. Ridley observes: "The notion that a man who has done well at Cherokee is *ipso facto* likely to make good civil servant is not found elsewhere."

Civil services must be seen against their wider institutional, social and historical backgrounds. The British system has been based on ninteenth century concepts of liberalism, private enterprise, and local self-government which saw the function of government as arbitration between interests, adjudication of proposals, and regulation of the activities of others. In France, there is a tradition since Napoleon for state intervention in many spheres of life, and it is accepted that the state has active responsibility for direct provision of services. In Germany, the home of professional public service, the administrative machine was designed for the management of important social and economic functions in addition to the maintenance of law and order. In Australia and America, strong egalitarian influences have had much to do with the doctrine and structure of the public service.

This little book is interesting not just for what it tells us about civil service but also for what it says about higher educational systems and how they relate to governments. Values inculcated in universities are reflected in the views of their graduates in public service and in what they consider to be most worthwhile and prestigious in the way of duties. In Britain and the United States, government has had little to say about university curricula; but in America, legislative action, particularly the Morrill Act, has given stature to the "applied arts," a prestige that has been carried over into civil service. French government assumes more direct responsibility for higher education that the British and has more often prescribed qualifications for professional practice, which has led to a more career-oriented higher education. Civil service career schools form an important part of the French system of higher education. Germany goes farther than any of the countries surveyed in linking university and professional training to particular public service careers. In law and medicine, university courses do not lead to a degree but to a state examination. There is no state examination for engineering, but the curriculum is under state supervision. In other technical fields, government will determine the qualification and in some areas will provide the training for it.

Some chapters of the book make generalizations without sufficient supporting data. At times, there is mere restatement of prevailing opinion about the effectiveness of public services. This is noticeably true in the United States paper where the argument is made for a high-level generalist administrative service of the sort outlined in the Second Hoover Commission Report. Bibliographic references are from the most standard texts and up-to-date citations are few. A number of important questions remain unanswered and perhaps cannot be answered. What kind of civil service organization can cope most effectively with modern problems? What education and aptitudes should a civil servant possess to perform best his functions in a modern society? One gets the uneasy feeling in reading these accounts that a service can be dedicated and efficient in performance of its duties and yet be irrelevant in many ways to the needs of the time. Conversely, states may be doing some of the right things though not always competently.

The book makes no prescription for British administration, but in the concluding chapter Prof. Ridley performs the best function of a generalist by ably summing up the evidence in the generalist-specialist debate and giving the whole subject a fuller and clearer statement than it has had. Dual hierarchy is not a central question in U. S. public administration, but American students will find the tracing of the broad theme of generalist-specialist through six governmental systems a valuable addition to the too-brief list of materials in comparative bureaucracies.—HUGH G. MACNIVEN, *University of Oklahoma.*

INTERNATIONAL POLITICS, LAW, AND ORGANIZATION

Alliances and Small Powers. By ROBERT L. ROTHSTEIN. (New York: Columbia University Press, 1968. Pp. 331. $10.00.)

This book is in essence a collection of essays unified only by the central proposition that "Small Powers are something more than or different from Great Powers writ small." (1) On the whole, it is a sound and carefully reasoned analysis of a thesis often obscured in the literature of international relations: that despite changes in the international system, Small Powers have continued to exhibit behavioral patterns different in kind and not merely in degree from those characteristic of Great Powers.

The author, discarding the "outmoded" method of calculating the distinction between Great and Small solely in terms of material capabilities, has defined Small Powers in a manner which takes account of psychological factors as well. Thus a Small Power is a state which in the eyes of itself and of other actors in the system is unable to "obtain security principally by use of its own capabilities," and which thus "must rely fundamentally on the aid of the other states, institutions, pro-

cesses, or developments to do so. . . ." (29)

But not *all* of the Small Powers so defined are examined in Professor Rothstein's study. He explicitly excludes from his analysis 1) Latin American states; 2) the behavior of all small states prior to 1815; 3) those small states which do not perceive a potential or actual threat from the policies of Great Powers.

The book is organized in three "self-contained" parts. The first, the most abstract and analytical, seeks to derive propositions about Small Power behavior "which are valid for any historical period." (7) Quickly dismissing as illusory or unattainable policies of neutrality, disarmament or world government, the author focuses on Small Power difficulties in achieving security by means of an alliance policy. He describes the unique advantages and disadvantages for Small Powers of three different types of alliances: unequal bilateral alliances between a Great Power and a Small Power, multilateral alliances among Small Powers, and multilateral pacts mixing Great and Small Powers.

Rothstein's analysis of Small Power behavior in the first two types of alliances is accompanied by two lengthy case studies, one tracing the history of the Belgian-French Military Accord of 1920, the second examining the rise and fall of the "Little Entente" between 1920 and 1938. The actual utility of these long and repetitive studies is difficult to discern. They are not well-told narratives, for they lack careful organization and fail to impart a clear sense of the flow of successive events. They seem excessively detailed for the author's purposes, and indeed only serve to obscure his basic points. (Especially irritating to this reviewer was the author's insistence on incorporating untranslated passages of French into the text, with only occasional translations included in the footnotes—a reversal of what would seem to be the proper procedure.)

Rothestein's subsequent generalizations about the two varieties of alliances not only (as he freely admits) are not limited to the lessons which can be drawn from the case studies, but, indeed, only occasionally refer to them. And his concluding generalization—that while the Small Power alliance is politically and strategically preferable to the unequal bilateral pact, both are inferior to a mixed, multilateral alliance—is, for some unexplained reason, unsupported by a study of the operation of this third type of alliance.

Part II examines the alliance strategy of Small Powers in the context of three historical international systems, those existing in 1815–1854, 1854–1914, and 1919–1939. Professor Rothstein utilizes systems theory not as an explanation of the activity of Small Powers, but as "merely another variable" setting limits to their behavior. (184) A basic difference in the actions of Great and Small Powers is discerned in the fact that the behavior of the latter is "conditioned, even determined, by the nature of the system itself." Though Small Powers can rarely "create their own opportunities" (182) and remain dependent on outside forces, some international systems are found to be relatively more conducive to the security and influence of these states.

Part III examines the central thesis in the context of the contemporary international setting, which the author declines to subsume under a single "systems" label. One section, most of which was published as an article in 1966, argues that the nonalignment of Small Powers in the contemporary world, viewed both as a tactical principle and as a "mystique," constitutes an order of behavior different from traditional "neutrality," fails to achieve "real" independence from Great Power interference, and is, in essence, a "scavenger" policy in new clothing.

The second section, dealing with the problem of nuclear proliferation among Small Powers, is taken largely from a 1967 article in which the author sought to establish that Great Powers and Small Powers both *ought* to and *do* calculate differently when deciding whether to acquire nuclear weapons. The analysis, focused on the behavior of the actors rather than on the prospects of stability for the system, concludes that while from a standpoint of military security the marginal utility of nuclear weapons for small powers is not high, when psychological and political factors are added in the option may become more attractive. Asserting that proliferation is the most critical problem of our time. Professor Rothstein suggests for the United States as the "minimum conceivable" measure for preventing proliferation a policy of bolstering nuclear guarantees with pledges to *give* nuclear forces to nuclear-capable countries facing a critical threat from a nuclear power. The author's policy prescriptions in this area are unfortunately dated by his failure to discuss the pending Non-Proliferation Treaty, which is simply dismissed in a footnote as "limited." (323)

One of the virtues of this book is the author's consciousness of its limitations and his great care in qualifying his analysis, which he describes as a "stationary target for future investigations." (8) He has built a well-reasoned argument in support of the conclusion that Small Powers, continually confronting the dilemma that "the necessity of insuring short-run security by supporting the strongest power" is in conflict with "the necessity of bolstering long-run security by supporting the weaker powers," (270) have indeed behaved in a manner unlike the Great Powers. And he has argued per-

suasively that, if the resulting Small Power policy of delaying commitment until the last possible moment seems unsatisfactory as a principle of action, then it at least illuminates "the impossibility of devising specific principles for Small Powers short of knowing all the circumstances affecting their situation." (270)—ROBERT H. DONALDSON, *Vanderbilt University.*

The Franco-Moroccan Conflict, 1943–1956. BY STÉPHANE BERNARD. (New Haven: Yale University Press, 1968, Pp. 680. $17.50.)

Is the "Academy of Colonial Sciences," which Marshal Alphonse Juin (who was then France's Resident-General in Morocco) addressed on the theme of Franco-Moroccan "cosovereignty" in November 1949, still holding sessions? If so, its program director might well invite sociologist Stéphane Bernard to present his conclusions on the irreversibility of the forces promoting decolonization at its next meeting. For though his analysis offers little solace to any remaining partisans of schemes like cosovereignty, certainly Bernard has brought to bear an imposing array of social science concepts and techniques upon one major episode in the history of colonialism. In attempting to reconstruct the "sociological mechanism" of the Franco-Moroccan conflict from 1943–1956, he presents an elaborate "theory of a political system in the process of decolonization" (p. xvii), a theory grounded in the structural-functional approach.

This edition is a translation of volumes I and II of a three volume work published in Brussels in 1963 as part of a series of studies of international conflict commissioned by the Carnegie Endowment for International Peace. The research was carried out by a team under the direction of Bernard, who is Director of the Center for Political Theory of the Institute of Sociology of the Free University of Brussels. The work is an ambitious one, uniting disciplines in order to define a theoretical perspective upon decolonization, a political process of interest to students of both comparative and international politics. Bernard seeks to embrace both these dimensions in his model of the conflict. While the total achievement of the work is impressive, the theoretical edifice will perhaps be more satisfying to sociologists than to political scientists.

Bernard offers us in volume I a detailed history of the period in Franco-Moroccan relations that began when President Roosevelt met Sultan Mohammed V in 1943 and ended with the reestablishment of Moroccan independence in 1956. Shortly after the termination of the protectorate, Bernard's researchers began conducting interviews with officials from Morocco's two communities, European and Muslim, and within French political circles. The resultant historical account is fresh and authoritative. Nevertheless it focuses primarily upon the evolving strategy of successive Residents—General in their attempt to contain Moroccan nationalism—from the thwarted reforms of Labonne to the hard line of Juin to the conspiracies of the Guillaume period that led to the deposition of Mohammed V.

Less attention is given to the nationalist leadership, relatively little emphasis is placed upon the nationalist conception of the struggle or the evolution of nationalist strategy. This characteristic of Bernard's account reflects his conviction that forces inherent in the social situation determined the eventual outcome. Implicit throughout his argument is the idea that the fundamental anti-French attitude of the Moroccan masses was the prime mover of the course of events, and the nationalist leadership essentially a secondary agent of this force. Bernard's interpretation is at once apt and misleading. On the one hand, most observers would agree that the social force underlying nationalist movements is the most important explanation of the general phenomenon of decolonization, and that nationalist leaders are expressions of such movements. Yet precisely because of this agreement, students of politics have turned their attention to more subtle mechanisms, concerning themselves for example with the determinants and the consequences of particular decisions of tactics and strategy which nationalist leaders have been forced to make. Something of the political drama of the struggle for independence as seen from Istiqlal headquarters is lost at the same time that we gain an appreciation of the view from the Residency-General as it waged its "stubborn struggle against an inevitable process." (p. 16).

Volume II presents the model. Bernard argues that a "valid theory of colonial conflict" requires answers to three questions, namely to what extent are political attitudes a function of the social situation, to what extent is decision-making capacity a function of these attitudes, and to what extent can a colonial regime, given its specific milieu, fulfill its problem-solving function (p. 422). These questions are indeed pertinent ones to formulate, and Bernard answers them comprehensively for both France and the protectorate. Yet the 200 odd pages in which he treats them do not clearly demonstrate why these three sets of data constitute a "valid theory of colonial conflict." Why not ask only the third inasmuch as the first two seem germane to a behavioral analysis of any political system, colonial or otherwise? Or why not pose other questions such as to what extent is the "consensual potential" (to evoke another term and theme central to Bernard's analysis: the relationship be-

tween authority and consent) of a colonial regime diminished by a given nationalist strategy? Perhaps Bernard would argue that this question is subsumed under one of his three categories; my point is that he does not adequately demonstrate the theoretical necessity and sufficiency of these three.

Bernard concludes that one can view the decolonization of Morocco either in mechanistic or functional terms as a transformation of political control. Both of these perspectives bring into focus instructive aspects of the conflict, the dwindling consent enjoyed by the residential authority or the decline in its ability to solve problems. Yet though Bernard may elucidate the sociological mechanism of this transformation, the political scientist is likely to stress that colonial legitimacy dwindled as nationalist leaders built effective organizations, and problem-solving capability diminished as the nationalists succeeded in defining the problems more in political terms than in technological terms. Bernard is to be sure well aware of this dimension of colonial conflict, but his emphasis lies elsewhere.

Indeed as a sociologist concerned with political theory, Bernard brings a valuable perspective to political scientists concerned with the various consequences of decolonization for Morocco and France. The total impact of his enterprise is engaging and impressive. It contributes valuably to our understanding of the processes of colonial systems coping with the very movements of social change that colonialism accelerated.—ROBERT A. MORTIMER, *Haverford College.*

The Nuclear Revolution In Soviet Military Affairs. TRANS. AND ED. BY WILLIAM R. KINTNER AND HARRIET FAST SCOTT. (Norman: The University of Oklahoma Press, 1968. Pp. 420. $6.95).

Several years ago the Soviet Union deployed the world's first anti-ballistic missile defense system. During 1968 the numbers of Soviet land-based intercontinental ballistic missiles surged close, or possibly equalled, the 1054 ICBM's possessed by the United States. At the same time the number of Soviet missile launching submarines increased also, but at a lesser rate. The undeniable Soviet activity regarding strategic nuclear weapons (increases also were noticed in the size and equipment of conventional forces) raises grave questions for the United States as it looks to its security for the 1970's.

To some, most notably the military and their supporters in the Congress and elsewhere, the Soviet actions are interpreted to mean the Russian Communists are still doggedly pursuing the goal of world domination, although with a new emphasis being placed upon strategic nuclear war as being "the continuation of policy by other means." Beneath the concern of these individuals is the belief that a major cause for the American success in the Cuba missile confrontation was the knowledge in both Washington and Moscow that the former possessed strategic nuclear superiority, as well as conventional superiority in the immediate zone of possible conflict. The fear expressed by this group is that the Soviets mean to surpass the United States for the first time in strategic nuclear weapons and that Moscow will then use the new relationship to advance its hegemonic objectives. On the other hand those who fear nuclear war more than they do Soviet expansionist designs are voicing alarm that the United States will overly and unnecessarily respond to the Soviet activity; and that in so doing the United States will launch a new, costly, and dangerous arms race.

In regard to the debate which is shaping up over what should be the proper American response to the Soviet activity it comes as no surprise that Kintner, Deputy Director of the Foreign Policy Research Institute, and Mrs. Scott an associate who is fluent in the Russian language, assign ominous intentions to the Soviet Union. Some may be tempted to lightly dismiss Kintner's effort as simply another "hawkish" book consistent with his views expressed together with those of Robert Strausz-Hupé *et al* in books such as *Protracted Conflict* and *A Forward Strategy For America.* This would be unfair because, although the message is much the same (the United States must be ever on guard against Soviet expansionism), the technique is different. Instead of telling the reader why the Soviets are dangerous Kintner and Scott offer translations of Soviet doctrinal and strategic writing which will, in the editors' view, "afford the reader an opportunity to examine for himself Soviet views on their 'revolution in military affairs' and to relate this to the future security of the non-Communist world and to the United States in particular."

The translations which are presented are drawn from recent [October 1964 to March 1967] authoritative Soviet military sources such as *Red Star,* the newspaper published daily by the Defense Ministry; *Communist of the Armed Forces,* the theoretical journal published by the Army and Navy; a set of volumes on military affairs entitled *Officer's Library;* several books published by the Soviet military press, and speeches made before the XXIII Congress of the Communist Party of the Soviet Union (1966). The translations are in the form of most Soviet official writing, turgid and repetitive. Of much more importance is the fact the reader may not interpret them as have the editors. For example, Kintner and Scott present a translation of an attack upon the much read, at

least in the West, 1965 article by General N. O. Talensky in which Talensky stated it was a "dangerous illustration" to believe thermonuclear war can advance a nation's political goals. In the translated article the Talensky thesis is criticized as follows, "Such an assertation is not only in error, but it is harmful because it can shake one's assurance in our victory over the aggressor, and the consciousness of the necessity to be ready at any moment for armed struggle with the use of nuclear rocket weapons." Whether such statements, and similar ones, should be interpreted as suggesting the Soviets mean to surpass the United States in strategic weapons as a prelude to advancing Soviet hegemony is open to argument. Another explanation is that the cited statement, and the others of like character which abound in the book, compromise nothing more than the normal expression of a military man's confidence in his nation's capacity for victory. Herein one finds the major problem with *The Nuclear Revolution In Soviet Military Affairs,* and indeed with all efforts to understand Soviet writing—as every intelligence officer knows it is much easier to determine an enemy's capabilities (in this case how many ICBM's he has) than to learn his intentions.

Because of its contents, and the implications for American policy suggested by Kintner and Scott, their book would normally be provocative and important. However both characteristics have been heightened by the election of Richard Nixon to the Presidency. It will be recalled that Mr. Nixon charged during his campaign that the Democrats had permitted a "security gap" to develop, and he stated if elected he would deal with the Soviets from a position of superior military strength. Unless Mr. Nixon's statements were only campaign oratory carrying little substance, it is logical to expect that the school of thought whose views are supported by *The Nuclear Revolution In Soviet Military Affairs* will receive sympathetic reading in Washington—unless of course someone steps forward to refute its message, and that being ascribed to the Soviet military activity.—ROBERT M. LAWRENCE, *University of Arizona.*

The "Other" State Department: The United States Mission to the United Nations—It's Role in the Making of Foreign Policy. By Arnold Beichman. (New York: Basic Books, 1968. Pp. 221. $5.95.)

This short volume by a verteran journalist is a contribution to the existing literature on the policy-making role of the United States Mission to the United Nations (USUN). Though limited, this literature is characterized by a split between those who find USUN and the missions of other nations playing a substantial policy-making role and those who judge these roles to be marginal. Professor Robert E. Riggs seemed to have joined the latter group when he stated in his *Politics in the United Nations* published in 1958 that he could find only one or two instances when the U.S. Delegation* exercised an important influence upon major questions of policy. The following year, after having served on the U.S. Delegation to the United Nations, Senators Hickenlooper and Mansfield complained of exessive control from Washington. They charged that Washington spelled out the official U.S. position in minute detail on almost every issue and when new developments required changes, these had to be cleared in Washington. Professor David Kay and Mr. Richard F. Pedersen disagree. The latter, former Chief of the Political Section of USUN, argues that national missions (presumably including USUN) enjoy a large measure of discretion in tactics and considerable influence on policy. He alleges that their role in the policy area, though advisory, is significant, particularly after an issue has been joined.

With the publication of *The "Other" State Department* Mr. Arnold Beichman has taken his stand with the latter group. He views USUN as a major factor in the decision-making of American foreign policy, reaching a position suggesting autonomy. Its position will continue to grow, so he avers, so long as it continues to enjoy the support of Congress and the American public, and so long as influential Americans to whom the President feels beholden continue to head it. Given their special relationship with the President, the heads of USUN have not had to fear reprisals from the State Department. Mr. Beichman alleges that they can commit the United States to a course of action, contrary to the wishes of the State Department. He recounts a most dramatic example of this: the successful attempt of Adlai Stevenson to reverse administration policy to enforce article nineteen of the Charter against the defaulting Soviet Union by depriving her of her vote in the General Assembly. The author maintains that this policy had received support from every appropriate official in Washington and New York including the President. By the manner of his negotiations with the Soviet Union in New York, however, Mr. Stevenson undermined any belief that the United States would hold firm. These he initiated without prior consultation with State, and they sucessfully undercut settled American policy.

The author envisages USUN as an actor in several subststems, principally those of the U.N. and the State Department, and he alleges that its role in the U.N. often conflicts with its role in the Department. He finds the milieu of the U.N. with its

* Although USUN is not the same as the U.S. Delegation to the U.N., the two can be used interchangeably in this review without affecting the essential meaning.

multilateral diplomacy to be a powerful force luring USUN away from its Washington connection. Mission personnel are constantly in danger of being "U.N. ationized." If this force is as powerful as Mr. Beichman contends and if USUN is as independent as he alleges, then we could logically expect many policy differences between USUN and State. But he is able to point to only a limited number of instances of such divergence—the one already mentioned plus mainly Ambassador Goldberg's iniatives with respect to South Africa and the Soviet Union. James J. Wadsworth, who has served with USUN, confirms the impression that these differences seldom occur. He estimates that USUN only once or twice a session finds its position sufficiently at odds with that of State to appeal for a change in official policy.

Mr. Beichman does provide evidence, some of it new, for his major thesis: that USUN enjoys an important policy-making role. But the evidence, consisting of a few case studies and the opinions of experts, is not systematic, nor is it conclusive. His principle sources are his own experience, memoir literature, and the statements of confidential informants. Some members of the political science fraternity will be happy to learn that he makes use of the latest concepts and terminology, perhaps the result of his recent graduate study at Columbia. His statement that all nations at the United Nations are equal we can excuse as carelessness or undue preoccupation with the formal rules of voting in the Assembly. Professor Goodrich's comment in the foreword about Mr. Beichman's contribution is close to the mark: while not the last word, this volume is a substantial introduction to the subject.—FREDERICK H. GAREAU, *Florida State University.*

America and Swaraj: The U.S. Role in Indian Independence. BY A. GUY HOPE. (Washington, D.C. Public Affairs Press, 1968. Pp. 106. $4.50)

This book demonstrates both the value and the danger of research which concentrates on a narrow slice of a complex, slowly-unfolding historical development. Guy Hope is, as the subtitle suggests, concerned with the specifically American contribution to the long and complicated series of events which eventuated in the independence of India.

Mr. Hope outlines exhaustively the activities of various groups in this country who were interested in independence for India. This is the great value of his work for it presents in one place a detailed and comprehensive account of the American concern. This is also the danger of this type of research for the narrow concentration of attention leads the author on occasion to recount every detail without sufficient evaluation of its significance. The result is the implication, and occasionally the imputation, of a greater American influence on the events leading to Indian independence than seems warranted if one studies these events in a broader context.

Nearly half of the book consists of a detailed account of the activities of different groups in the United States who, Mr. Hope argues, helped to influence the course of events in India. The best sections concern the role of Indian Nationals, such as the energetic and persuasive J. J. Singh, who were resident in this country and the internal policy discussion within the State Department. Mr. Hope's careful study of State Department documents, in particular, produces a detailed and interesting account of the evolution of official views on the Indian question and some penetrating comments on the dilemmas confronting the decision-maker in the foreign policy area. He also discusses sensitively the impact which an individual's official position in the State Department hierarchy has upon his perspective as he approaches a decision.

Some of the other sections are less impressive. In his commendable effort to provide a comprehensive account of the American role, the author frequently fails to distinguish adequately between the trivial and the significant. There is much raw data here and too little critical evaluation of it.

The discussion on activities of the American academic community, for example, includes an account of a petition signed by ninety-nine students from Miami University in Ohio. Student activism, it seems, is not so new and revolutionary as some of its exponents today assume. But how significant was this petition in securing Indian independence? Does it merit a quarter of a page in a book of slightly more than one hundred pages? One has no feeling that the author has distinguished in his research between mere activity and activity which has a significant impact upon historical events. Can he then convincingly specify the impact which America did, indeed, have on Indian independence?

The section on the role of Congress raises similar methodological concerns. The author has made a detailed study of the *Congressional Record* to document the influence of Congress. A study based largely upon insertions in the *Record* can, however, be exceedingly misleading as anyone who has served as a Congressional intern and prepared items for inclusion in the *Record* knows. Mr. Hope provides a wealth of raw data from the *Record,* but he fails adequately to evaluate the nature and strength of the Congressional concern and, as a result, its impact on the achievement of Indian independence. He does, however, understand the role of Congress in this situation—that of a forum through which voices supporting Indian independence could speak.

The best and most valuable portion of the book

is concerned with the activities of three unusual diplomats during World War II. Mr. Hope examines in detail the subtle and sensitive contribution of Sir Girja Shankar Bajpai, the first official representative in Washington of the British Government in India, a man aware of his responsibilities and loyal in his discharge of them, but also an Indian with strong personal convictions. The discussion of Louis Johnson's mission is also good, but the most significant new contribution to our understanding of American involvement in India's struggle for independence comes in the section on Ambassador William Phillips where the author has used material gathered in personal interviews with the former diplomat.

Mr. Hope concludes with what he describes as a theory "to explain how American influence meshed into the pattern of British policy making." He argues that activity by Americans in India's cause "was strongly inspired by progressive elements in British politics." The result was "astute prompting . . . of public statements and private and official diplomacy by Americans at various levels of authority." These statements were then used by the group in the British Parliament as a "principal resource in the campaign to achieve liberalized treatment of Indian demands."

One might question the words, "principal resource," and still agree that this was indeed the American role. That leaves unanswered, however, the significance of the American role in the totality of pressure and events which led to the independence of India.—PHILIP M. PHIBBS, *Wellesley College.*

Arms Control Agreements: Designs for Verification and Organization. By DAVID W. WAINHOUSE in association with BERNHARD G. BECHHOEFER, HARRY D. HUGHES, BYRON V. LEARY, THEODORE ROCKWELL III, ANNE P. SIMONS, AND ARNOLD WOLFERS. (Baltimore: The Johns Hopkins Press, 1968. Pp. 179. $6.95.)

Further evidence of this kind is probably superfluous, but if this book accomplishes nothing else, it should help to disarm the Senatorial inquisition that has asked, for several years now, why the U.S. Arms Control and Disarmament Agency (ACDA) subsidizes work that is more properly the domain of Ph. D. theses. The volume at hand is the work of a team skilled mainly in law and foreign affairs, but including also one technological and one military expert. Their study has assimilated a large and complicated body of technical and political data; analyzed it in four detailed case studies; and derived operating principles to guide the design of an International Disarmament Organization (IDO) to verify the implementation of both narrow and broad gauge arms control measures. Initially a report to the ACDA by the Washington Center of Foreign Policy Research, the work has been revised and condensed for publication.

The book is an important contribution for many reasons. First, it appears at a time when the superpowers and others may escalate the arms race to new levels unless mutually acceptable arms controls can be reached. While political obstacles are more severe than technical ones, solutions to the latter must also be overcome. The Wainhouse study suggests ways to reconcile the U.S. concern with reliability and the Soviet interest in minimum instrusion. To begin with, the authors believe that the intrusion required for adequate reliability is less than earlier assumed. More particularly, if one considers the objects needing inspection given a superpower cut-off of fissionable material production or a Central European atom-free zone, for example, it turns out that a far smaller inspection staff is needed in the Communist than in the Western states concerned. Unless the Communist regimes decide they want parity, this asymmetry might make inspection more palatable for them.

A book such as this may easily be criticized for its emphases and its omissions. More space is given to U.S. proposals such as a production cut-off and a deployment freeze than to Communist proposals. Although the aughors indicate they will not discuss the political-military implications of the Rapacki and Gomulka plans (p. 44), they do in fact provide a negative assessment of these implications (pp. 47–49). By comparison, the book tends to presume the utility of most measures endorsed by the White House (although there is no visible enthusiasm for the fourth case studied: the first stage of the general disarmament plans submitted by Washington and Moscow).

It is unfortunate that this book does not consider the problems that have already arisen regarding compliance with the 1963 nuclear test ban, the 1964 understanding of fissionable material production, and the 1967 space treaty. Surely these difficulties are significant for the proposed IDO. Although Wainhouse has directed another study for ACDA entitled *Alternative Methods for Dealing with Breaches of Arms Control Agreements,* the conclusions of that study are not spelled out in the present work.

Similarly, the book does not consider the suggestions made to surmount the problem of verifying an underground test ban. One would think that such notions as "challenge inspection" and "international detection club" would have relevance to the proposed IDO.

Despite the heroic effort here to bridge the gap between U.S. and Soviet positions, a great distance remains to be travelled. The authors have elucidated their answer to some extremely complex

problems, but alternative answers are also conceivable. The book may spur others (hopefully including Soviet researchers) to produce such answers, while in the interval technological and military developments change the nature of the problem. For example, Wainhouse *et al.* would rely upon gross physical inspection techniques to verify a freeze on strategic delivery vehicles, but is this approach adequate at the moment when multiple warheads could be mounted on each missile?

Looking beyond the immediate concerns of the study, one wonders whether an IDO—*if* created on a model like that recommended here—would not move the nations toward a limited form of world government much more rapidly than fuctional collaboration confined to technical spheres. The IDO inspectorate is supposed merely to report the facts to the great power members of the organization, who, in turn, must determine whether a violation has occurred and what response to make. This distinction is too facile, however, for the content and tone of the reporting would prove to be sensitive political acts. Because of this sensitivity potential, the IDO may never be established; but if it is, nations may well feel strong incentives to keep the system from collapsing.—WALTER C. CLEMENS, JR., *Boston University.*

The Aland Islands Question: Its Settlement by the League of Nations. By JAMES BARROS. (New Haven: Yale University Press, 1968. Pp. 362. $10.00.)

Despite nearly a quarter century of evidence and argument to the contrary, many scholars, most statesmen, and, one suspects, nearly all of the otherwise shrewd men in the street persist in thinking of the United Nations as an appropriate dumping ground for the world's major conflicts. And if the overburdened organization, with almost no resources of power of its own, doesn't come up with a remedy to these often insoluble dilemmas, the Russians are accused of obstructionism or worse, and the organization itself is judged a failure.

Fortunately, though, scholars and statesmen are beginning to recognize that the UN was never expected to resolve clashes between the Great Powers if the peculiar WW II alliance came apart. Increasingly, we are recognizing that the UN should not be adjudged a failure when it doesn't do what it was never meant to do. And there is a slowly growing awareness that it is a mistake to bring all the major world problems to the UN for solution. Often the problems simply are exacerbated there and the organization staggers dangerously under their weight.

But, while the UN has made little contribution to easing Cold War confrontations in Europe and Asia, it has proved quite helpful in resolving, or at least managing, peripheral clashes and problems, most notably with its peace-keeping operations for the Suez, Congo, and Cyprus imbroglios. Under certain rather special conditions, the UN can be a useful instrument of conflict management.

In these general respects, the UN and the League of Nations are quite similar. The League was no more able to stop Hitler and the Japanese imperialists than the UN has been capable of ending the Cold War. But the League did register some modest achievements during its brief lifetime. One of these was the League's contribution to the settlement of the Aland Islands dispute between Finland and Sweden. James Barros has presented us with what must certainly be the definitive analysis of this dispute and its resolution. As such, his book is a welcome addition to the literature on the modest role international organizations can occasionally play in conflict management.

The Aland Islands, a group of small islands in the Baltic Sea, had been disputed territory for over 60 years when both Finland and Sweden claimed them after WW I. When bilateral negotiations broke down in the early summer of 1920, it appeared that Sweden, militarily much stronger than Finland but protective of its neutralist image, might resort to force. At that point, however, the British and French brought the matter to the League which established two special commissions that led to agreement a year later: the islands went to Finland, but a large measure of autonomy was given to the islanders who are Swedish in language and culture. The League enabled the parties to continue the diplomatic struggle in another forum rather than go to war. League involvement provided a safety valve for the tense situation and later a face-saving aura of justice for the compromise settlement. Concessions were made through the League that could not have been made directly by one party to the other. Each government could justify its acceptance of half a loaf since the agreement bore League sanctification. Inis L. Claude has pointed out that this function of collective legitimization has been even further developed by the United Nations. But the rudiments of the process were worked out during the 1920s as Barros demonstrates.

One might have wished for an arrangement of the materials in Professor Barros' book other than the day-by-day, blow-by-blow chronicle which is exhausing as well as exhaustive. Moreover, Professor Barros fails to highlight adequately the key points he wants to make along the way which it is even more necessary to do in a chronologically-ordered account than it is in a topically-organized essay since in the latter form we at least have the

selected topics for clues as to what the author thinks is important. Finally, the surprisingly short final chapter of conclusions is not really the chapter of conclusions about the League's settlement of the Aland Islands problem that we should have; rather, it is a collection of conclusions and assertions about the role of international organizations in today's world that would be more appropriate and more credible at the end of a volume of supporting case studies of League and UN interventions—a book still needed, incidentally.—JAMES A. STEGENGA, *Purdue University.*

European Community Law and Organizational Development. By W. ANDREW AXLINE. (Dobbs Ferry, N.Y.: Oceana Publications, Inc., 1968. Pp. 214. $7.50.)

There are many possible approaches to studying political integration either as a process or a fait accompli. Mr. Axline has chosen to employ law and organization as relevant measures of determining the existence of European integration or social development toward it. In constructing his theoretical framework and justifying his methods, he appears to argue that a society is built upon organizations and institutions reflecting the existence of "valid" normative (ought) as well as actually "effective" (is) law. These organizations, in turn, can further generate such law. Through this interaction each can promote the other. A point may finally be reached where the nature of the organization, its law-making capacity, and the "effectiveness" of the law evidence a fully integrated society. Evolution of the society toward that point can be recognized by examining first the structure and functions of the society's organization with the methods of the Functionalists; second the existence of "valid" law with the help of the methods elaborated by Analytical Jurisprudence; and third the prevalence of "effective" law as Sociological Jurisprudence understands this. Since the "effectiveness" of law lies in its ability to determine actual behavior of the society's members, it can serve as a mirror of the society's integration. To the extent that it possesses three qualities, to that extent integration can be said to exist. (1) "Effective" law must have the same significance for all members of the European Community. The author is satisfied that in a large measure it does. (2) It must be equally binding upon all members and have equal meaning for them. (3) The Community's law must be superior to the constitutions of the members; it must have primacy within their own legal systems. In this respect, the author finds the situation differs from state to state and only a trend toward the growth of these qualities can be discovered. The data for these findings of the author are the decisions of the national European courts and the Court of Justice of the European Communities. As measured by these criteria, European Community integration remains incomplete. The author thinks his analysis and findings justify the suggestion that national judges have it in their power to further European Community integration by interpreting laws whenever possible in favor of the European Community rather than national sovereignty.

Because of the obfuscous style of the book I cannot be certain that this summary is fair to the author. If it is, I should maintain that the extreme narrowness and formalism of the author's approach can only result in conclusions of limited significance. The vast range of social behavior which may contain important clues to social integration is inadequately reflected in "effective" law, especially if this law is culled only from court decisions. Moreover, upon the author's own grounds, I have serious doubts about the general validity of his particular approach. The nature of behavior revealed by court decisions has little relation to objective or subjective factors leading to or constituting integration. The same overt, objective behavior may or may not be indicative of integration. It is, however, always indicative of "effective" law. How then can "effective" law as a mirror of integration be distinguished from "effective" law arising from any multilateral treaty having no goal of integrating its signatories? No amount of argument about the legal significance of Community law for the national legal systems of the member states—its superiority or primacy—can answer this question. It cannot be answered in legal terms because integration is not a legal question. The answer requires an examination of the motivation and the social context of the behavior. They determine whether a given behavior is related to integration or not. The author recognizes this problem but treats it cavalierly. There is a brief reference, out of context with this particular problem, to an alleged community of feelings among Europeans potentially supportive of integration. The reader may thus be expected to share with the author the assumption that because there are feelings in common within the European Community and because these feelings are allegedly favorable to integration, the "effective" law to be found in the Community makes it identical with integration. However in this case, the integration rests not on a legal foundation but on psychological grounds for which no empirical support is provided.

This is not the only occasion on which the reader must complete the author's argument by assembling points scattered throughout the book. Loose organization, aggravated by indifference to the English language, makes it difficult to follow

the author's thoughts and leads him to be imprecise regarding his central concepts. A few references to particulars must suffice to demonstrate that this criticism is more than subjective reaction.

The concept of integration is crucial to the author's presentation. It is nowhere analyzed in depth or made operational. On page two it is called a "fundamentally sociological concept," on page six a "psychological" concept. On page fourteen integration is declared indentical with "effective" law while on page 62 "effective" law is said to represent "political integration." Definitions by other authors which Mr. Axline quotes fail to clarify his own understanding and use of the concept of integration and are, in fact, ignored in his analysis. The literature most relevant to Mr. Axline's subject—for instance Rudolf Smend's *Verfassung and Verfassungsrecht,* Hermann Heller's writings, and the vast literature on legal philosophy—is nowhere taken into account. "Cohesion," "sense of community," "solidarity," "shared values" are unquestioningly accepted as prerequisites of integration, but either not defined or not operationalized. Yet the author does not hesitate to talk about them in quantitative terms: "amounts" and "degrees" of integration, "a great deal" of solidarity, etc. (pp. 3, 5, 83, 96). Conclusions are drawn from such undefined concepts as "primitive" or "elementary" societies and law. No meaning is given to such terms as "stable legal systems," a "real common market," a "positive peace," a "higher order" of rules (pp. 7, 70, 84, 95). And not least as long as language is an important tool of one's trade: the English language is violated by dangling participles, misused prepositions, ambiguous referents of such pronouns as "this" and "it," and the inexact use of words (there are several "primary" concerns; "in terms of" is used ad nauseam—ten times on page 64—and often incorrectly).

In principle Mr. Axline's project is interesting and has some value for the study of social integration. One can only wish that the author had handled it with more precision, in a wider context, and with a better sense of aesthetics.—WERNER LEVI, *University of Hawaii.*

International Systems and the Modernization of Societies. By J. P. NETTL AND ROLAND ROBERTSON. (New York: Basic Books, 1968. Pp. 216. $5.95.)

Apriori frameworks for the analysis of political development are in such abundance nowadays that each new proposal tends to be perceived as having declining marginal utility within the literature. The present volume, though aimed at presenting new schemas, tends to be more of an eclectic adventure in ideas. The three chapters are separate essays that for the most part do not follow cumulatively or logically from one another but instead explore a number of problems, both conceptual and theoretical. Just as the commentary becomes most exciting and promising one's train of thought is terminated abruptly by fascinating footnote references. No specific connection between their ideas and a strategy for empirical research is provided, despite their recognition in the preface of the need for empirical testing. Illustrative material is used in order to point out conceptual difficulties rather than to concretize or to clinch arguments.

Chapter I points out pitfalls in defining three terms—industrialization, modernization, and development—an exercise more in keeping with concept formation by intuition than by postulation. The definitions, the authors claim, are more in accord with their actual usage within developing countries than with the alternative frameworks in vogue among academicians, an assertation that is not matched with empirical evidence.

Chapter II sets forth a paradigm, based upon the legal concept of inheritance, which attempts to account for two postcolonial alternatives—reform and revolution. Elite (or mass public) perceptions of the role of the newly independent government vis-à-vis the departing imperial power, especially the level of hostility held by the former toward the latter are postulated as predictors of revolutionary inheritance, in which militant groups contest the will drawn up by the power granting independence to a former colony. Although the authors admit that their paradigm "does not apply to Latin America," and their explication lacks references to actual statements by decision makers in the newer states, their stress on the attitudinal component of political development remedies a lack of such a *systematic* focus among those currently applying the frameworks of Almond and Riggs.

Chapter III proposes a societal system framework for analyzing international systems, and it overzealously purports to solve the problem of linkage between the political subsystem and other subsystems of the international societal system by concentrating on attitudinal cleavages. The most discussed dependent variables are international stratification systems. Galtung's rank disequilibrium approach is turned upside down into a quest for factors that account for compliance or noncompliance to the existing stratification systems on the part of various types of states.

Alternative natural languages and approaches within the social sciences, however, can best be evaluated in terms of their role in an ongoing research process. A proposal for a new symbol sys-

tem is always welcome if it alerts a scholarly community to a new field for inquiry or if it orders previous partial frameworks into a homogeneous synthesis. After alternative languages (such as those of Almond and Riggs) reach the stage of competing schools of thought, and once empirical research has begun, a new language may often be suggested out of an awareness for the procrusteanness of the models as guides to the reality under investigation. Whereas the authors of this volume appear to feel that no previous framework adequately encompasses evaluative aspects of domestic political and international societal development, one could counter that now is the time for research to uncover data that are consistent or inconsistent with the propositional theories advanced by Almond, Riggs, and others, which do in fact have attitudimal orientations. Whether more scholars will take the path of empirical research or will prefer to await the formulation of additional natural languages may be a loaded question, yet it will be asked by the reader of this preliminary formulation.—MICHAEL HAAS, *University of Hawaii.*

Conference Diplomacy. By JOHN KAUFMANN. (Leyden: A. W. Sijthoff, 1968. Pp. 222. $6.90.)

Given the ever increasing number of international conferences, a volume on conference diplomacy does not seem untimely. The author of this book, a Dutch diplomat of considerable experience, presents essentially a guide or handbook to the organization and operation of international conferences.

Hardly an element of conference diplomacy is missed, though some are dealt with in a rather cursory fashion. The variety of delegations, their composition, and their organization are examined, as well as the requirements and characteristics of conference diplomats. Special attention is given a somewhat neglected area of scholarship, the role of the secretariat in conference diplomacy. This emphasis reflects, perhaps, the increasing importance of secretariats as international conferences become larger and their subject matter more complex. Special attention is also given the role of the presiding officer at international conferences.

Other sections of Kaufmann's book are concerned with some of the principal areas of conflict at international conferences, conference leadership—by individual delegations, the president, an "inner circle," groups, and the secretariat, and types and functions of groups and their role in the negotiating process.

This book in many ways fails to capture the dynamics of conference diplomacy, however. Granted, discussions of missions, protocol, the nationality of delegations and the like are not very stimulating subjects, but when the reader gets to a section on tactics, he expects more than he finds in this volume. Most of the methods employed by diplomats to get a proposal adopted or to cause it to be rejected are mentioned, but the description is of rather static processes. The reader might also expect a little more from a chapter on dicision-making. And one wonders why, if it is to be included at all, a discussion of summit diplomacy is allotted only thirteen lines. We learn here, simply, that decisions of an intergovernmental conference are not usually affected by the presence of a head of state or a head of government.

The last chapter of this book deals with three case studies in conference diplomacy, and this is the author's most successful chapter. The first two sections are concerned with trade negotiations and disarmament negotiations, and include a summary of developments in each of these areas since the Second World War. In section three the author compares trade and disarmament negotiations, the General Agreement on Tarriffs and Trade, especially the Kennedy Round and the Eighteen-Nation Disarmament Committee focusing on the elements of conference diplomacy examined in the preceding pages, such as the role of the large powers, the role of the smaller powers, participation of UN organs and the Secretariat, group activities, outside influences, and publicity and privacy. The final section of this chapter analyzes an international conference held in February, 1967, called by the Netherlands to consider Indonesia's economic future. Again the discussion centers on the elements mentioned earlier in the book.

Kaufmann suggests in this chapter that contrary to the disarmament negotiations where it was the basic interests of the super-powers that caused constraints, in the Kennedy Round it was the structure of the negotiating machinery that became a delaying factor. The author's analysis of the Kennedy Round negotiations also reveals the special role that the Director-General of GATT played in bringing about a compromise agreement when negotiations on certain major issues seemed at a standstill.

Kaufmann's third case study is perhaps his best choice. This section could be subtitled: "How to Have a Successful International Conference." Kaufmann asserts that the success of the conference concerned with Indonesia's economic problems was due to the fact that the "right conference diplomacy techniques" were employed. He lists the following: careful preparation; limited objective and simple agenda; the right type of documents ("neither too voluminous nor too brief"); unity of meeting place and delegate residence; high quality of services; efficient chairmanship; and full cooperation of important interna-

tional organizations interested in the subjects discussed.

Conference Diplomacy is especially strong on the organizational aspects of international conferences. In a sense, as already suggested, it is a "How to" book. It also convincingly indicates how intergovernmental conferences have modified some of the traditional methods of diplomacy. The book seems to take for granted, however, that international conferences are good and useful. At no point does the author take a hard look at some of the disadvantages of conference diplomacy. This is a major omission. Kaufmann has put together a rather complete book but not a very stimulating one. Perhaps this is because of his attempt to keep the book concise. Concise it is, though the illustrations used are excellent and the notes indicate a thorough familiarity with the literature on the subject and on international organization generally. Exactly for whom this work was written is not quite clear. It seems rather elementary even for those technical experts or private citizens who might be attending an international conference for the first time, a use suggested in the Forward. This book will, also, not detain the scholar long. Perhaps it will find its greatest use in an introductory international organization or international relations course in conjunction with other works.—JOHN A. EILERS, *Arizona State University.*

Capitulación sin guerra. By FERDINAND OTTO MIKSCHE. (Madrid: Instituto de Estudios Políticos. Translation from the French and Preface by Luis Cano Portal. 1967. Pp. 273.)

In the first part of the book Mr. Miksche discusses the present situation of the West since the floodgates were opened to Soviet Imperialism in 1945, and he feels that the initiative has passed to Moscow after the Suez crisis of 1956. Two factors are of prime importance in this development. One, internal, the exaggeration of liberty, has turned into increasing Byzantine confusion and, together with pacisfism, appeasement and paralysis, extends its influence all over the Western world, so that the West is well on its way to perish despite its unsurpassed economic and technical advances. The other, external, concerns decolonization, relentlessly pursued by the Soviet Union and the United States. He feels that the early departure of the Western powers from several strategic areas was just as unwise as allowing the Soviets to get as far as the Elbe, and the author blames the Europeans for their lack of solidarity and the Americans for their political naivete. In view of growing Soviet threats and the different strategic concentration of Western Europe and the United States, whose interests are no longer identical, a united Western Europe is an absolute *sine qua non,* otherwise Europe will not survive the new division of the world by the three superpowers and the extraordinary changes in the world which will develop dramatically the closer we come to the year 2000.

The second part of the book which deals with the security problems of Western Europe, especially the success of Soviet co-existance policies after the death of Stalin resulting in the psychological disarmament of Western Europe, is essentially a realistic appraisal of the situation. Nuclear dissuasion is considered by the author as bluff, since he believes neither side would ever employ atomic weapons; the balance of terror by necessity has given conventional forces a greater significance. Moreover, United States strategy is meant to be purely defensive and therefore, the author feels, is condemned to a progressive weakening.

The author discusses the decline of NATO which he links essentially to the refusal of the United States to treat France on a par with Britain and to the "nuclear complicity" between Washington and Moscow. Should the United States continue with this policy it will not only lose control over the production but likewise over the military use of the atom. Instead of pursuing these aims, the United States should put the Soviets on notice that, since it cannot stay forever in Europe, it intends to help Western Europe with nuclear arms. The author does not foresee any major war in Central Europe, but instead a great likelihood of civil wars throughout the world, possibly in Germany or the Mediterranean. Therefore, Western strategy, he asserts, is not realistic, since NATO offers no guarantees, and in the mind of the masses the security of Western Europe is identified with a line—the Iron Curtain—whereas what should be defended are not geometrical lines but geographical positions outside the geographic limitations of NATO. Hence, a global outlook is necessary, otherwise the West will not be able to survive. The idea that in a world of quick change nations can defend their interests with a purely defensive attitude is nothing but a dream.

For a reform of NATO the author proposes: *De-Americanization* (defense of Europe by Europeans), *integration* (Continental Western Europe), and *simplification* (armaments). The new NATO would be divided into two blocks: one, *Anglo-American* (United States, Canada, Britain, Iceland), the other, *Western European* (France, West Germany, Benelux, Italy, Spain). Besides these *active* members, there would be *associate* members like Norway or Greece, countries which would not enjoy the treaty's guarantees. It might also be possible to establish a Nordic Defense Community with Norway, Denmark and neutral Sweden. These are certainly interesting proposals which

seem to offer some solution to the present disagreements between France and the United States.

This reviewer feels that Mr. Miksche's analysis of the West's decline is valid, since nowhere have we seen so far any successful reaction to Soviet strategy. On the other hand, while certainly the wisdom of the United States' refusal to aid France in the development of its nuclear arsenal and to treat it on an equal basis with Britain can be questioned, it is also true that the French were equally not willing to share nuclear weapons with West Germany, a fact that Mr. Miksche omits in his discussion. Finally, while the inclusion of Spain into the new NATO seems to this reviewer pertinent and logical, it is doubtful that it will be accepted, since many Western Europeans and Americans seem to be more obsessed with pure democracy in Spain (and Greece) than with the dangerous threat from the East.

All in all, a fascinating and passionately-written book which should receive the widest circulation.—O. CARLOS STOETZER, *Fordham University.*

ANNOUNCEMENTS

The sixty-fifth Annual Meeting of the Association will be held September 2–6, 1969, at the Commodore Hotel, New York City.

1969 ANNUAL MEETING AND SLATE OF OFFICERS FOR 1969–70

The 1969 Annual Meeting of the Association will be held September 2–6 at the Commodore Hotel, New York City. Professor Robert E. Lane, Yale University, is Chairman of the Program Committee.

At the Annual Business Meeting of the Association, to be held at 4:00 P.M. Wednesday, September 3 (the room will be announced in the Final Program) the Nominating Committee will propose a slate of officers for 1969–70. The Committee is composed of three members appointed by President Merle Fainsod: Harry Eckstein, Princeton University; Leon D. Epstein, University of Wisconsin; and William S. Livingston, University of Texas; and three members appointed by President David Easton: Frederic N. Cleaveland, University of North Carolina, Chairman; Duncan MacRae, University of Chicago; and Sheldon S. Wolin, University of California, Berkeley. The Committee will propose the following officers for 1969–70:

President Elect: Robert E. Lane, Yale University

Vice Presidents: Grant McConnell, University of California, Santa Cruz

William H. Riker, University of Rochester

Robert E. Ward, University of Michigan

Secretary: Thomas R. Dye, Florida State University

Treasurer: Francis E. Rourke, Johns Hopkins University

Members of the Council for two years:

Samuel P. Huntington, Harvard University

Henry S. Kariel, University of Hawaii

John H. Kessel, Allegheny College

Lewis Lipsitz, University of North Carolina

John Meisel, Queens University, Kingston

Jewel L. Prestage, Southern University

Robert H. Salisbury, Washington University, St. Louis

Ellis Waldron, University of Montana

PROGRAM COMMITTEE: 1970 ANNUAL MEETING

The 1970 Annual Meeting of the Association will be held in Los Angeles, California, September 1–5 (the hotel will be announced later). Suggestions for papers to be presented at the 1970 Annual Meeting are earnestly solicited. Unlike previous years, the 1970 program will comprise more than two dozen sections, each of which will have as many as four panels, with each panel providing an opportunity for one or more papers. No section chairman can possibly be familiar with all of the work going on in his domain. Thus it becomes necessary for scholars whose work is just coming to fruition to make this work known either to the Program Chairman or to the relevant section chairmen. This is particularly true when the research forms part of a dissertation currently under way.

Please advise the Program Chairman or the section chairmen listed below of research which, either now or within a year, will very likely form the basis for a high quality research report at the meetings. Since the program is currently being shaped, it is not too early to anticipate events more than a year in the future.

Chairman, Richard L. Merritt, University of Illinois

A. *General*

NOTICE

RESOLUTIONS AND CONSTITUTIONAL AMENDMENTS AT THE ANNUAL BUSINESS MEETING

In accordance with the Constitution of the American Political Science Association, the attention of members of the Association is hereby directed to the provisions of the Constitution that:

"All resolutions shall be referred to the Council for its recommendations before submission to the vote of the Association at its Annual Business Meeting." (Article VIII)

"Amendments to this Constitution shall be proposed by the Council and adopted by a majority vote of the members present at any regular or special meeting of the Association.

"Ten members of the Association may propose amendments to this Constitution. Such proposed amendments shall be referred to the Council for consideration, and by them referred to the Association for its action thereon at the next Annual Business Meeting with such recommendations as the Council may see fit to make." (Article IX)

The Council of the Association will meet during the afternoon of Sunday, August 31, the afternoon of Monday, September 1, and the morning of Tuesday, September 2 (the room will be announced in the Final Program).

The Constitution of the Association is printed in both the 1961 and 1968 editions of the Association's Biographical Directory.

The American Political Science Association's Committee on the Status of Women in the Profession will hold an open meeting at the Annual Meeting on Wednesday, September 3, at 11:30 a.m. The purpose of this meeting will be to review (1) the problems faced by women in the profession, (2) questionnaires concerning these problems which will be sent to members of the profession, and (3) possible means of dealing with these problems.

Professional Placement Service at 1969 Annual Meeting

(September 2-6, 1969)

A professional placement service will again be available to members of The American Political Science Association attending the New York meeting. The placement service will be provided by the U. S. Employment Service. The primary purpose is to provide an efficient means for employers to meet prospective employees and vice versa.

The Professional Placement Service is entirely separate from the APSA's Personnel Service and requires separate registration. There is no fee for use of the Professional Placement Service by employers or applicants at the Convention.

All State Employment Service local offices accept orders and applications in the field of political science on a year-round basis as a regular part of their professional service.

If you plan to attend the Conference and utilize the Placement Service, please mail the form below as soon as possible, *but not later than August 1, 1969.* Application and/or employer order forms will be forwarded to you upon receipt of the following information.

Name: .....

(Organization or Institution) .....

.....

Address: .....

.....

(City) (State) (Zip Code)

☐ Employer (check either) ☐ No. of Vacancies

☐ Prospective Candidate ☐ No. of Area(s) of Specialization

Will you be available for interviews during the Annual Meeting?

☐ Yes ☐ No

Fill in appropriate blocks and mail to: Mrs. Jean Landeau, New York State Employment Service, 444 Madison Avenue, New York, New York.

PROCEEDINGS OF THE ANNUAL MEETINGS

of

The American Political Science Association

Complete proceedings of the APSA Annual Meetings (including copies of all papers delivered from 1956 through 1968) may be obtained by contacting the Customer Services Department, University Microfilms, Ann Arbor, Michigan 48106.

PROCEEDINGS on Microfilm: $22.50 per reel
In hard copy (individual papers): $2.00 each
Prepayment Required

THE AMERICAN POLITICAL SCIENCE ASSOCIATION'S

Personnel Service . . .

The American Political Science Association's Personnel Service operates as a "clearing house," bringing together political scientists seeking positions and prospective employers. Registration in the service, at a $6 per calendar year fee, is open to all members of the Association. Here are the details of its operation:

Position Openings

- A Newsletter is mailed monthly to those Association members seeking positions through the Personnel Service. There are presently over 900 members in the Personnel Service.
- The Newsletter lists, by code number, position openings and job descriptions.

Employers Using the Service

- Any employer may use the Association's Personnel Service.
- Types of positions listed include teaching on the university level, administrative positions with professional organizations, research and administrative positions with federal, state and local government agencies.
- There is no cost to the advertising institution.

For further information concerning registration write to:

Director, Personnel Service
The American Political Science Association
1527 New Hampshire Avenue, N. W., Washington, D. C. 20036

AMERICAN POLITICAL SCIENCE ASSOCIATION
1969 SOVIET UNION AND EASTERN EUROPEAN TOUR SEMINAR PROGRAM

ITINERARY:

The Tour-Seminar will leave July 14 and return August 18 for a 35 day tour which will include: Budapest, Sophia, Bucharest, Moscow, Leningrad, Warsaw, Prague, and Berlin.

COST:

The cost to Association members under a group plan with a minimum of 25 participants will be under $1,600.00. Included in the fare will be round-trip tourist air transportation, first class hotel accommodations, three meals a day except in Berlin where only breakfast will be included, baggage handling, sightseeing, and airport and meeting transportation. (On the basis of past experience, participants can expect that the cost of this educational activity will be accepted as deductible expense on Federal tax return).

SEMINAR PROGRAM:

In cooperation with the governments of the nations on the itinerary and the relevant U.S. departments, the Association will arrange meetings with leading public officials, members of university faculties, U.S. Foreign Service Personnel, and representatives of the press.

For further information concerning this educational, research, and travel opportunity, please write Director, APSA 1969 Soviet Union and Eastern European Tour Seminar, The American Political Science Association, 1527 New Hampshire Avenue, N.W., Washington, D.C., 20036.

SEATS STILL AVAILABLE

APSA SUMMER FLIGHT B

August 2 to September 1 — New York to Paris

Round trip $265

For further information write to the Director of Summer Flights, American Political Science Association, 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036.

COLUMBIA  COLUMBIA

Columbia University Press is proud to announce the establishment of a new Contemporary American History Series. Under the general editorship of WILLIAM E. LEUCHTENBURG, the series will focus on significant problems, people and developments in American history since World War II.

REBELS AGAINST WAR: THE AMERICAN PEACE MOVEMENT, 1941-1960

LAWRENCE S. WITTNER

The first volume in the Contemporary American History Series, this is the first book to carry the history of the American peace movement beyond the thirties and up to 1960. The author has made extensive use of the largely untapped files of American pacifist groups as well as personal interviews with leaders of the peace movement such as the late Norman Thomas, the late A. J. Muste, and David Dellinger. $10.00

POLITICS, LAW, AND SOCIAL CHANGE

Selected Essays of Otto Kirchheimer

Edited by FREDERIC S. BURIN and KURT L. SHELL

Contains twenty essays representative of the wide scope of scholarly efforts of the late Otto Kirchheimer. The essays, a number of which appear here for the first time in English translation, are arranged in three parts: Uncovering Basic Mechanisms of Political Order and Disorder; The Transformation of Democratic Politics; and Man, Victim and Maker of Society. The book contains an introduction to Kirchheimer's life and work by John H. Herz and Erich Hula. $12.50

POLITICS AND BEEF IN ARGENTINA: PATTERNS OF CONFLICT AND CHANGE

PETER H. SMITH

This is an exploration of the pressures, alignments, and social behavior which characterized Argentina's crucial twentieth-century years of change —years in which power passed from the landowning elite to the rising urban proletariat headed by Juan Peron. The author, making liberal use of concepts and techniques from political science, sociology, and economics, focuses on the struggles over Argentina's beef industry—key to the nation's economy and the object of bitter political dispute.

Sponsored by the Institute of Latin American Studies, Columbia University. $10.00

TRADITION AND REVOLT IN LATIN AMERICA

R. A. HUMPHREYS

This is a book of essays by a most distinguished British historian. Some of the essays are detailed studies of the economic, constitutional, and international aspects of the struggles for independence in Latin America. Others are concerned with the general history of Latin America. The times studied range from the eighteenth to the twentieth centuries.

This is one of a series of studies sponsored by the Institute of Latin American Studies of Columbia University. $7.50

SUBVERSION AND SOCIAL CHANGE IN COLOMBIA

ORLANDO FALS BORDA

A social history of Colombia from the Spanish conquest to the present, this book deals with such concepts as development, revolution, technology, social class and conflict, and the utopian elements of subversion. The author shows that subversion, traditionally seen as something immoral or destructive, may have a positive dimension in the creative impulse of people challenging an unjust social order. $7.50

New and Recent Titles

Agenda for the Nation
edited by Kermit Gordon

". . . a superb one-volume introduction to the problems facing this nation today. . . ." John W. Gardner.

Eighteen leading specialists on domestic and foreign affairs take a fresh look at the problems confronting the cities, the schools, government officials, and all those responsible for making economic and foreign policy. The contributors: Charles L. Schultze, James L. Sundquist, James Tobin, Kenneth B. Clark, Anthony Downs, James Q. Wilson, Ralph W. Tyler, Clark Kerr, Herbert Stein, Stephen K. Bailey, Francis M. Bator, Marshall D. Shulman, Edwin O. Reischauer, John C. Campbell, Richard N. Cooper, Max F. Millikan, Carl Kaysen, Henry A. Kissinger.
1968 620pp $6.95

Politics and Policy:
The Eisenhower, Kennedy, and Johnson Years
by James L. Sundquist

". . . each section is tightly written and immensely informative. . . ." *The Western Political Quarterly.*

The legislative achievements of Congress in 1964 and 1965 followed a prolonged governmental deadlock over the country's domestic problems, including those of employment, poverty, education and civil rights. This study explores the history of the laws passed in the mid-1960s in these areas and analyzes the working of the system in order to identify patterns of policy formation and the role of specific governmental and political institutions in the policy-making process.
1968 560pp paper $3.50 cloth $8.75

Congress and Urban Problems:
A Casebook on the Legislative Process
by Frederic N. Cleaveland and Associates

Rapid urbanization is changing the face of America and challenging Congress with new problems that cut across governmental functions and geographical areas. The seven studies presented in this book suggest the range of these problems and the emergence of a new field of public policy. The contributors are Randall Ripley, M. Kent Jennings, John E. Moore, Judith Heimlich Parris, and Royce Hanson. Frederic N. Cleaveland contributes a final chapter that puts these legislative experiences into perspective.
1969 405pp paper $2.95 cloth $7.50

Every Second Year:
Congressional Behavior and the Two-Year Term
by Charles O. Jones

"The book is well-written and will interest the lay reader as well as the scholar. . . ." *Annals.*

Selected by *Choice* as an Outstanding Academic Book, this volume examines the length of the term for members of the House of Representatives, analyzes the alternatives to the present two-year term, and assesses the prospects for change.

THE PRESIDENCY

Aaron Wildavsky, Editor
University of California, Berkeley

A book of select readings, including nine original pieces and focusing on analyses of the office of the President, a viable political institution, rather than on the man.

Employing modern social science techniques, the book explores the most important relationships of the Executive, those with its "publics": the general public; other political institutions such as the party, the Supreme Court, and the Congress; and Presidential adivsers.

An incisive introduction by the author summarizes modern research efforts and discusses current research needs on this most important political institution in American life.

The Study of Congress Series

CONGRESS AND THE NEW POLITICS

John S. Saloma III

Massachusetts Institute of Technology

This book poses some crucial questions for the United States Congress as it faces the decade of the 1970's: How well is the Congress today performing its functions in the American political system? What adaptations must it make to survive in a new political era and in a governmental system that will be significantly altered by the modern computer?

The analysis begins with a consideration of the problem of evaluation. Then, four different views of the ideal relations and functions of the President and Congress are presented and applied to the work of the contemporary Congress. Saloma concludes by speculating on the impact of information systems on Congress (and the Presidency), as well as the influence of several political trends defined as characteristic of the "new politics" of the 1970's.

LITTLE, BROWN MANUAL
IN POLITICAL ANALYSIS

ELECTORAL BEHAVIOR

William H. Flanigan and David E. RePass

University of Minnesota

Announcing the final version of the first in an eight-volume series of innovative political analysis "laboratory" manuals, each aimed at bringing to undergraduate teaching the sophistication and the excitement of dealing with genuine research problems, the discovery and examination of data, rather than passive acceptance of conclusions.

Prepared for use in courses on American public opinion and voting behavior, the manual has as its major purpose enabling students to examine substantive questions about American electoral behavior through their own analysis of political survey data. In addition, students may acquire an appreciation for and facility with the analytical methods employed by political scientists when they undertake research with survey data.

The manual consists of 15 structured exercises, plus numerous suggestions for further analysis, designed for use where students have relatively free access to a counter-sorter. A special *Instructor's Manual* has been prepared for use in classes lacking data-processing facilities. For classes with equipment, the publisher will provide a 2000-card (IBM) *Data Analysis Deck,* taken from the Survey Research Center's Presidential election surveys of 1952, 1956, 1960, and 1964, and keyed to a Code in *Electoral Behavior.*

New Books from The University of Chicago Press

Propaganda and Promotional Activities
An Annotated Bibliography
Harold D. Lasswell, Ralph D. Casey, and Bruce Lannes Smith
With a New Introduction by Harold D. Lasswell

Originally published in 1935, this was a standard reference for many years. The present edition includes all the original material as well as a new Introduction by Lasswell, discussing increasingly sophisticated developments in the study and management of communication over the past thirty years—television debates, "hidden persuaders," use of drugs and hypnosis in psychiatric treatment of mental disorders, tactics of "brainwashing," and other aspects of propaganda in modern societies.

1969 LC:75-77979 Details to be announced

Politics, Personality, and Social Science in the Twentieth Century
Essays in Honor of Harold D. Lasswell
Edited by Arnold A. Rogow

Harold Lasswell, one of America's most distinguished political scientists, is a man whose work has had enormous impact both in the United States and abroad not only upon his own field but those of sociology, psychology, economics, law, and anthropology as well. This collection of essays is the first full-scale effort to deal with his voluminous writings and explore his at once charming and baffling personality, which is perhaps inseparable from the inventiveness, unconventionality, and unusual scope of his work.

1969 LC:76-75812 360 pages, $11.00

La Guardia Comes to Power, 1933
Arthur Mann

In his first volume on La Guardia, "Mann wrote one of the best political biographies of the decade. In this second volume . . . he has written one of the very best accounts of a mayoralty nomination and election, combining the skills of a highly competent historian with the political scientists' methods of analysis to produce a significant addition to our knowledge about La Guardia, New York City, and city politics more generally."—Wallace S. Sayre, *Political Science Quarterly.*

First Phoenix edition, 1969 199 pages Paper, $1.95

La Guardia
A Fighter against His Times, 1882–1933
Arthur Mann

"Arthur Mann . . . has asked himself a multitude of germane questions and faithfully sought their answers. In some cases he has brilliantly succeeded. . . . Those old associates of the Mayor who encouraged Mr. Mann to undertake this study . . . ought to feel well satisfied with the result. . . . What has been given them is an analysis of one individual's political behavior which has the significance of a general conclusion about all such figures."—R. G. Tugwell, *New York Times Book Review.*

First Phoenix edition, 1969 384 pages Paper, $2.95

Human Nature and History
A Study of the Development of Liberal Political Thought
Robert Denoon Cumming

This monumental work analyzes the relation between political theory and political practice. Generally, it treats the question of what is involved in the enterprise of political theory or political philosophy, and how different conceptions of that enterprise have developed historically. Specifically, it deals with the format imposed on the development of political thought by Anglo-American liberalism. Cumming's study will be of interest to political theorists, historians of thought and culture, and philosophers. *2 volumes.*

Just Published for American Government courses —

American Public Policy: Documents and Essays

600 pages 6x9″ $5.95

by Thomas R. Dye, University of Georgia

Provides students an opportunity to deal first-hand with resource materials on public policy — legislative acts, court decisions, statements and reports from the executive branch of government, and clear statements of alternative policy positions by national figures. Includes the Civil Rights Act of 1964, the Economic Opportunity Act of 1964, the Report of the President's Commission on Civil Disorder, Engle vs. Vitale, the Geneva Agreements of 1954, the Report of the U.S. Civil Rights Commission, the Testimony of Secretary of State, Dean Rusk, before the Senate Foreign Relations Committee, and other primary source materials for public policy. Also provides clear and forceful statements of alternative policies — for example, the Black Power alternative from Stokeley Carmichael, the negative income tax proposal, a plan for federal-state revenue-sharing by Walter Heller, and the "Arrogance of Power" critique of U.S. foreign policy by Senator J. William Fulbright.

Each chapter begins with an introductory essay by the author which describes the development of American public policy and places each document and essay within the context of policy development. Areas covered include segregation in public schools; the Negro in American society; protest and public order; health, welfare, and poverty; housing and urban renewal; taxing and spending; business and labor; military affairs; and foreign policy.

ANNOUNCING APRIL 1969 PUBLICATION

This is a textbook for introductory courses in political science which immediately involves the student in the *content* of political science, through materials about the public in politics. Theories and methods are not presented abstractly or in isolation from data. Rather the student is led to understand theory and method through examples and questions directly related to the real political world. Illustrative material is designed to interest contemporary students. For example, participatory democracy, racism, Vietnam, television, group politics, political power, reform and other current topics are discussed in various contexts.

Professor Barber has written an unusually imaginative and useful instructor's guide which is available without cost upon request.

c. 200 pages **$5.95 Hard Bound, $3.50 Paper Bound**

This paperback volume contains ten complete articles which relate directly to the chapters in CITIZEN POLITICS. The articles are brief and highly readable examples of behavioral research on politics. While this collection provides ideal supplementary reading for Barber's text; it could also be usefully read in any course on political behavior, public opinion, American government or introduction to political science.

c. 250 pages **$3.95 Paper Bound**

POLITICAL POWER
A Reader in Theory and Research

Edited by Roderick Bell, David V. Edwards, and R. Harrison Wagner, all of the *University of Texas*

Political Power, the only book of its kind, contains the major writings on the concepts of power and influence concentrating on conceptual definition, theory, and measurement. Illustrating some of the problems of the scientific method in political science, it argues that efforts to define and measure power have outrun the development of theory. Twenty-seven selected theoretical discussions by political theorists, methodologists, sociologists, and others, are grouped under five headings: *The Study of Political Power; Political Power and Political Science; The Concept of Power; Theory Formation and Measurement;* and *The Concept of Power and Theories of Political Systems.*

BUREAUCRATIC BEHAVIOR IN THE EXECUTIVE BRANCH
An Analysis of Organizational Change

By Louis C. Gawthrop, *State University of New York, Binghamton*

Presenting an intensive view of the federal bureaucracy, this vital supplementary text is the first theoretical analysis of bureaucratic behavior in the executive branch. It examines its subject in terms of organizational responses to both internal and external change and systematically compares public and private bureaucracies. The book evaluates four basic topics: conflict resolution, decision-making, organizational loyalty, and the interrelationship of these three to organizational change. In addition, it develops an analytical model which can be used to examine bureaucratic behavior in the executive branch of the federal government.

1969 285 pages paper, $2.95

THE POLITICAL IMAGINATION IN LITERATURE
A Reader

Edited by Philip Green, *Smith College,* and Michael Walzer, *Harvard University*

The Political Imagination in Literature is a new kind of reader that has been long overdue. It supplements the standard materials of political science education with sixty-one selections of high literary merit that dramatically express the richness of political life and political thought. The readings are an impressive anthology of Western literature and show students the experience of politics as elaborated by great writers. Every reading represents an important, specific problem in a major area of political science.

THE POLITICAL SYSTEMS OF EMPIRES
The Rise and Fall of the Historical Bureaucratic Societies

By S. N. Eisenstadt, *Hebrew University, Jerusalem*

Winner of the 1964 MacIver Award, this volume is a monumental analysis of the social and political structure of the chief historical empires and the causes of their rise and fall. ". . . distinguished by careful and cautious scholarship, bold interest in exploring new paths, and generous recognition of the work of other scholars . . . *The Political Systems of Empires* constitutes a major contribution to sociology, political science, and comparative history."—*The American Historical Review*

543 pages $4.95

THE SCIENTIFIC STUDY OF FOREIGN POLICY

By James N. Rosenau, *Rutgers University*

Each of the original essays in this collection constitutes an important contribution to international politics. The volume contains more than a dozen articles including *Foreign Policy as an Issue Area, Pretheories and Theories of Foreign Policy, Comparative Foreign Policy,* and *The Functioning of International Systems.*

Fall, 1969 approx, 450 pages $8.95 tent.

THE INTELLIGENCE OF DEMOCRACY
Decision Making Through Mutual Adjustment

By Charles E. Lindblom, *Yale University*

"There can be little doubt that Professor Lindblom has examined the arguments for centralized and decentralized decision-making with much greater care, thoroughness, precision, and subtlety than has hitherto been the case. His book, therefore, performs a distinct and important service for American political science and should be read by all students of the discipline." —*The Annals*

"It presents a powerful critique of the most widely held conception of how decisions—of man and government, corporations and societies—are made and ought to be made; it spells out an alternative approach; and it explores the relationship between decision and policy making and two central values of social-political life: democracy and equality." —Amitai Etzioni, *Science*

1965 360 pages $7.50

THE IDEOLOGY OF FASCISM
The Rationale of Totalitarianism

By A. James Gregor, *University of California, Berkeley*

The Ideology of Fascism draws extensively on original sources for its study of Italian Fascism and examines the subject in the wide context of modern totalitarianism to show the basic causes of fascism. The author suggests a general typology of revolutionary mass movements that reflects contemporary thinking with respect to description and analysis of totalitarian movements.

Fall, 1969 approx. 450 pages $11.95 tent.

POLICY-MAKING IN BRITAIN
A Reader in Government

Edited by Richard Rose, *University of Strathclyde*

Chosen on the basis of quality, relevance, permanence, and difficulty of access, the twenty-four articles in this collection are by both American and British scholars, politicians, journalists, and others. Among the selections are "On Being a Cabinet Minister," "Planning: The National Health Service," "White House and Whitehall," and "Complexities of Party Leadership." Professor Rose places special emphasis on recruitment, political roles, and case studies. He has included a full introduction to each of the four sections and a short note introducing each article.

THE PROCESS OF POLITICS:
A Comparative Approach

By Jorgen Rasmussen, *Vanderbilt University*

A new textbook for all courses in beginning political science and comparative politics. THE PROCESS OF POLITICS provides a synthesis of the basic findings of comparative research in a context of discovery and student initiative. In six chapters [*The Significance and Aims of Comparative Politics; Environment and Politics; Varieties of Political Change; Expressing and Focusing Demands for Authoritative Decisions; Policy-making and Implementing Structures;* and *Who Governs?*], the student is made aware of the relations and behavior patterns which have been found to exist cross-nationally and which have been replicated in studies of political systems.

For the teacher, the text is equally useful, for it may be adapted to any preferred method of instruction. For example, a course focusing on a number of foreign governments could use this book as an introduction to the study of comparative politics and as a model against which politics in each country may be compared. Instructors who choose instead the functional approach could similarly use this book as an introduction to the primary governmental functions as performed in a variety of political settings.

Viet Nam

THE ORIGINS OF REVOLUTION

by John T. McAlister, Jr.

Princeton University

Mr. McAlister shows that the Vietnamese conflict is a revolution whose origins lie in the age-old problems of disunity and internal strife, and in the modernizing effects of French colonialism. Using documents from the still-classified archives of the French Army, he examines in detail how and why the Vietnamese launched a revolution against French rule in 1945-6. $7.95

What are the real lessons of Vietnam?

TIME OUT OF HAND

REVOLUTION AND REACTION IN SOUTHEAST ASIA

BY **ROBERT SHAPLEN**

author of *The Lost Revolution*

"The real tragedy of Vietnam," Robert Shaplen writes, "is that we are likely to learn very little from our involvement there." In this crucially important new book, *The New Yorker's* Asian correspondent helps us to understand what is happening – and is likely to happen – in all Southeast Asia as a result of the Vietnam War. He presents a nation-by-nation analysis of the state of affairs in Indonesia, Singapore, Malaysia, Thailand, the Philippines, Cambodia, Laos and South Vietnam. A final chapter – "The United States after Vietnam" – raises vital questions about our past and future Southeast Asian policy.

A Now Perspective . . .
From Van Nostrand Reinhold

EUROPEAN POLITICS II: The Dynamics of Change

Edited by William G. Andrews, State University College, Brockport, New York. Summer, 1969, about 288 pages, app. $2.95, paper.

This updated volume of readings, like its widely acclaimed predecessor, *European Politics I*, is designed to supplement textbook reading in comparative government courses that include the political systems of Europe. The contributors bring a wide range of experience and perspective to bear on analyzing the process of contemporary political change in selected European countries, separating the superficial from the significant, the transient from the enduring.

Table of Contents:

Changes in European Attitudes and Institutions; *Roy C. Macridis, Brandeis University*/Changes in the British Labour Party; Parliament and Government; *Robert T. Holt and John E. Turner, University of Minnesota*/Changes in French Politics after the Presidential Elections; *William G. Andrews*/Changes in West German Politics after Erhard's Fall; *George K. Romoser, University of New Hampshire*/Changes in Soviet Policies after Khrushchev's Fall; *John A. Armstrong, University of Wisconsin.*

ISLAM IN AFRICA

Edited by James Kritzeck, Director, The Institute for Advanced Religious Studies, University of Notre Dame; and William H. Lewis, George Washington University. Early Spring, 1969, 339 pages, $8.75.

An exhaustive selection of interdisciplinary readings by the foremost authorities—American, British, French and African—on the history and present state of Islam's pervasive expansion into every region of Africa. The readings focus on Islam's relation to pagan Africa, modern nationalism, law reform, and emerging social patterns. Special attention is devoted to the contemporary scene in selected countries, such as Nigeria, Uganda, Cameroun and the Congo; the various sects and religious fraternities are examined in concluding chapters. Numerous illustrations, maps, tables, and a wealth of bibliographical references enhance the value of this work as a supplement to courses in African and Middle Eastern Studies.

THE FABRIC OF DEMOCRACY: Readings in American Government, Second Edition

Edited by Charles P. Blackmore and Abraham Yeselson; both of Rutgers, The State University of New Jersey. Fall, 1969, 420 pages, paper.

An imaginative collection of readings on the processes of national government. Brings the widely read first edition up to date in the field of civil rights, particularly on issues relating to the First Amendment and due process. In addition to entirely new chapters on black power and the recent national election, the work provides substantial new material on the presidency, federal finance, federal business activities, natural resources, welfare and farm policy. Designed for use in conjunction with a basic text in an introductory course in national government.

AMERICAN POLITICS: Effective and Responsible?

Quentin L. Quade and Thomas J. Bennett, both of Marquette University. Early Spring, 1969, 151 pages, $3.00, paper.

A provocative analysis and evaluation of contemporary American political institutions in terms of effectiveness and responsibility. The authors devote special attention to the present and potential role of the national political party. This concise and clearly written text provides an excellent supplement to courses in American government.

FORTHCOMING PAPERBACKS FROM THE NEW PERSPECTIVES IN POLITICAL SCIENCE SERIES

Under the General Editorship of William G. Andrews, State University College, Brockport, New York, this series of studies, essays, surveys, and symposia seeks to add fresh dimensions and new perspectives to issues and areas relating to the study of government and politics.

Now, a ten-volume series of bibliographies

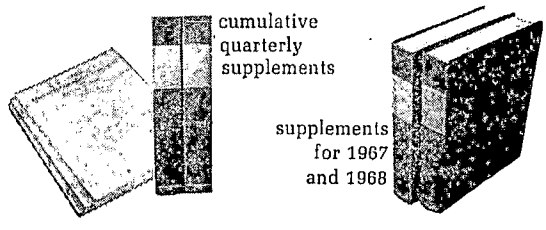
SPEEDS ACCESS TO ALL SIGNIFICANT PUBLISHED LITERATURE IN THE POLITICAL AND BEHAVIORAL SCIENCES

Available for immediate delivery is the Universal Reference System *Political Science Series*, a 10-volume compilation of deeply-indexed books, papers, articles and documents published in the political, social and behavioral sciences.

Compiled by professional political scientists, and computer-processed into organized format, the URS provides the professional political scientist, administrative management, the political psychologist, the jurist, author, ecologist, humanist and student with ultrafast, multifaceted access to substantive published literature in their fields.

The Universal Reference System is easy to use, and reduces literature search time from hours or days to just minutes. The search is more fruitful, and brings to the researcher's attention many more significant works than would ordinarily be uncovered under any other type of organized literature search. Moreover, the researcher can quickly assess the relevance of any piece of literature because each reference includes a clear, concise summary of the document in question.

The ten-volume basic library is available for immediate delivery and covers the following political and behavioral science subfields:



I International Affairs
II Legislative Process, Representation and Decision Making
III Bibliography of Bibliographies in Political Science, Government and Public Policy
IV Administrative Management: Public and Private Bureaucracy
V Current Events and Problems of Modern Society
VI Public Opinion, Mass Behavior and Political Psychology
VII Law, Jurisprudence and Judicial Process
VIII Economic Regulation, Business and Government
IX Public Policy and the Management of Science
X Comparative Government and Cultures

Each volume (referred to as a CODEX) contains approximately 1,200 8½ x 11 inch pages and cites between 2,000-4,000 books, articles, papers and documents. Covered in the library are the books of about 2,400 publishers throughout the world. Each CODEX includes a list of periodicals cited in that volume. CODEXES are attractively bound in gold-stamped brown and green buckram.

Price of the complete library is $550.

Each year, three newsprint supplements—each covering all ten political science subfields with a single alphabetical Index—will alert scholar, researcher, student and professional political scientist to the most recent literature and current research activities in relevant categories. Each quarterly supplement cumulates the material in the preceding quarterly(s). The year-end quarterly cumulates the entire year's material which will cover—in addition to books, articles and papers—about 700 journals screened for material in all ten political science subfields. The fourth quarterly will be published in two bound volumes. In keeping with good encyclopedic practice, these will be easily differentiated from the basic library by the use of reverse color in their bindings.

Price for the cumulative quarterlies and the year-end pair of bound volumes is $250.

Bound annual supplements for 1967 and 1968 cumulate the deeply-indexed annotations of all the significant journal articles and books published during these years. Two bound volumes—alphabetically indexed to embrace all ten subfields—contain the literary reference output for each year, and are distinguished from the basic library by réverse color in their bindings.

Price for the two 2-volume sets is $200.

A NEW FOREIGN POLICY FOR THE UNITED STATES
Hans J. Morgenthau

"Makes a driving case. . . . Condemns a whole genre of abstract gobbledygook on foreign policy."—*The New York Times.* "Every reader, from layman to scholar, should be treated to Morgenthau's rich analyses and to the seven general principles of foreign policy which, he concludes, should serve as the collective touchstone of the national interest." —*Library Journal.* Published for the Council on Foreign Relations. *264 pp., index.* U-645/$2.75

THE POLITICS OF URBAN EDUCATION
Edited by Marilyn Gittell and Alan G. Hevesi

"This meticulously selected series of papers . . . demonstrates that radical changes in attitude and approach must be made if the educational system in America is to be an instrument of rather than a barrier to integration. . . . Well written and soundly presented, this may be the best single book to date on the subject."—*Library Journal. 396 pp., index.* U-676/$3.50

THE DEMOCRATIC EXPERIENCE: Past and Prospects
Reinhold Niebuhr and Paul E. Sigmund

Reinhold Niebuhr offers a profound historical discussion of the democratic experience in the West; Professor Sigmund relates Dr. Niebuhr's themes to the problems of the new nations today. "This wise and enlightening book examines the conditions under which democracy has worked in the past and, in doing so, throws fresh light on the vital question of democracy's future."—ARTHUR SCHLESINGER, JR. *August (examination copies now available). 202 pp., index.* U-673/$2.25

THE INSECURITY OF NATIONS: International Relations in the Twentieth Century
Charles Yost

When Ambassador Yost's book appeared in the hardbound edition, in 1968, *The New York Times* called it "wise, suave, contradictory, and horrifying; its message is deadly serious. . . . [Yost's] account of the breakup of the old order before and during World War II, and the genesis and effects of the Cold War is lucid, cool, and sensitive." Published for the Council on Foreign Relations. *286 pp., index.* U-678/$2.95

CONFRONTATION AT OCEAN HILL–BROWNSVILLE: The New York School Strikes of 1968
Edited by Maurice R. Berube and Marilyn Gittell

An unparalleled overview of the decentralization battle that paralyzed public education in New York City last fall. By selecting the basic documents in the conflict, as well as the most articulate pieces written by observers from both sides, the editors not only illumine the critical issues that shaped the crisis, but also for the first time make objective analysis possible. *352 pp.* P-244/$2.95

SOVIET-AMERICAN RIVALRY IN THE MIDDLE EAST
Edited by J. C. Hurewitz

Within the context of the superpower rivalry now dominating events in the area, leading Western experts here analyze the political, economic, cultural, and military situation in the Middle East today and offer knowledgeable projections for the 1970's. Lincoln P. Bloomfield, Frederick C. Barghoorn, I. William Zartman, and Professor Hurewitz are among the contributors to this timely text. Published for the Academy of Political Science. *256 pp., bibliog.* U-677/$2.95

The Nineteenth-Century Constitution 1815-1914

Documents and Commentary

Edited by H. J. HANHAM

A collection of documents illustrating constitutional, political, administrative and ecclesiastical history, with emphasis on constitutional theory and the party system of the period. Professor Hanham's introductions to each section relate the documents to the major political developments and debates.

This is a companion to Elton: *The Tudor Constitution,* Kenyon: *The Stuart Constitution,* and Williams: *The Eighteenth-Century Constitution.* Cloth $10.00 Paper $4.95

Two English Republican Tracts

Plato Redivivus (1681) by HENRY NEVILLE and *An Essay upon the Constitution of the Roman Government* (c. 1699) by WALTER MOYLE

Edited by CAROLINE ROBBINS

Professor Robbins's introduction discusses the contributions of Neville and Moyle to English republicanism, sources and characteristics of English republican ideas, and the influence of the republican group. (*Cambridge Studies in History and Theory of Politics*) $10.00

Herder on Social and Political Culture

Translated and edited by F. M. BARNARD

These selections contain Herder's most original and stimulating ideas on politics, history and language. Many of them have not appeared before in English.

In his introduction Professor Barnard discusses the basic premises of Herder's political thought, examines his concepts and theories, and provides a brief comparative analysis of traditionalist thought following the French Revolution. (*Cambridge Studies in the History and Theory of Politics*) $11.50

The Political Thought of John Locke

An Historical Account of the Argument of the *Two Treatises of Government*

JOHN DUNN

A reinterpretation of the meaning of Locke's political thought, placing his ideas in their exact context and stressing the historical question of what he intended to claim in the *Two Treatises.* The author emphasizes the theological character of Locke's thinking on politics. $10.00

CHARGE AND COUNTERCHARGE

A Film of the Era of

Sen. Joseph R. McCarthy

produced and directed by
EMILE DE ANTONIO

Original footage depicting the rise to power and fall from grace of the Junior Senator from Wisconsin, including substantial footage from the Army-McCarthy hearings. Under the direction of Emile de Antonio, who made "Point of Order," CHARGE AND COUNTERCHARGE explores vividly and dramatically such subjects as the separation of powers and the clash between legislative and executive power; the role of personality in the American political process; the effect of television and the media in creating and destroying political figures; the purpose and operation of legislative investigations; the limits of secrecy in governmental operations; the use of Cold War crises and the "communist menace" as a device to attain political power. The "cast" includes some of the most important and influential political figures of our day. CHARGE AND COUNTERCHARGE offers students a hard, unflinching look at the realities of contemporary American political life. It is designed to heighten student interest in such courses as American government, introduction to political science, and the legislative process. With Instructor's Manual.

Political Violence
The Behavioral Process

H. L. Nieburg, *University of Wisconsin, Milwaukee*

This essay offers a theoretical explanation of all types of political violence. It relates individual violence (murder, assassination) to group violence (riot, revolution) to nation-state violence (war) in a continuum of political behavior that makes clear the inherent connection between stability and disorder. Because it conceives of individuals, groups, nations, and international coalitions as rational enough to choose between violent and non-violent means for achieving their goals, it recognizes violence as the symptom of a widespread urge for greater integration and the more equitable distribution of values, arguing that violent political behavior cannot be dismissed as erratic or exceptional, but rather must be seen as natural, erupting under certain conditions, and having a positive role in creating and testing political legitimacy, in conditioning the terms of social bargaining and adjustment, and in reintegrating and ameliorating human society.

192 pages Cloth, $4.95 Paper, $2.50

Coming in August—

Power in the Senate

Randall B. Ripley, *Ohio State University*

An analysis of power in the contemporary Senate that places the Senate in historical perspective and examines the processes of change within it. Part I presents three general models of power distribution, sketches the development of the principle institutional competitors for power since 1869, and treats in detail the transition from one pattern of power distribution to another in the years between 1945 and 1968. Part II describes and analyzes the distribution of power in the contemporary Senate. Part III analyzes the major consequences of the distribution of power in the contemporary Senate.

256 pages Cloth, about $6.50 Paper, about $3.50

Coming in November—

Political Change in Britain
Factors Shaping Electoral Choice

David Butler, *Nuffield College, Oxford*
Donald Stokes, *University of Michigan*

Based on three nationwide surveys of the same British voters in 1963, 1964, and 1966, this study lays the foundation for a comprehensive theory about how voters acquire party allegiances and how they change them. The surveys included questions about voters' current attitudes toward parties, leaders, and issues, as well as about their voting histories. In addition to analyzing the actions of the individual voter, the book studies changes in party fortune over the generations, developing concepts about voting behavior that are relevant to any democratic society.

A New Series: AFRICA IN THE MODERN WORLD

General Editor: GWENDOLEN M. CARTER

This comprehensive series will deal with the government and politics of the sub-Saharan African states. Each book will focus on the political situation of a single country or region, but will also discuss its historical background, economy, social structure, and external affairs. The books will be regularly revised.

The first book is:

Liberia *The Evolution of Privilege*

By J. GUS LIEBENOW

In his study of West Africa's oldest republic, the author examines the political structure and ideology of a country that was founded in 1822 by the American Colonization Society, declared its independence in 1847, but has maintained strong ties with the U.S.

The book provides a timely description of Afro-American nationalism and the progress in Africa of a black-governed state.

248 pages, chart $7.50

Communism in the United States—*A Bibliography*

Compiled and edited by JOEL SEIDMAN. This guide will become a standard reference for students of the political history of present-day radicalism. By including material both favorable and unfavorable to communism, the author fills in the gaps of earlier bibliographies and also revises, expands, and updates these works.

560 pages. $17.50

"Had the voices to which the authors refer been heard . . . Viet Nam might have been different."—SENATOR EDWARD M. KENNEDY, *from the Foreword*

Viet Nam—The Unheard Voices

By DON LUCE and JOHN SOMMER

With a Foreword by SENATOR EDWARD M. KENNEDY

This is no ordinary book about Viet Nam. It was written by two Americans who speak Vietnamese fluently, and who lived and worked in Viet Nam's cities, hamlets, slums, and refugee camps for many years. Mr. Luce was director of IVS (International Voluntary Services) for six years, until September 1967, when he and several key staff members resigned their posts to protest American policies. This book reveals, in moderate tones, but with compelling force, the reasons for their protest.

"The most important firsthand memoir to come out of the American experience in Viet Nam; it is also the most fascinating. . . . Their book is a story of people, of the tragic sympathy the Vietnamese have for Americans despite the suffering our acts have caused, and of the incapacity of Americans to understand the human dimension of the conflict.

—JOHN T. MCALISTER, JR.
Author of *Viet Nam: The Origins of Revolution*

350 pages $6.50

Ideology in America

Change and Response in a City, a Suburb, and a Small Town

By EVERETT CARLL LADD, JR.

Does ideology still exist in American politics? "Yes" writes Mr. Ladd in this skillful, sophisticated study of American political life, but the traditional split between liberal and conservative is no longer meaningful. By investigating in depth the ideational life of three typical American communities, the author presents a road map for following avenues of political conflict in our rapidly changing, post-industrial society.

416 pages $11.50

Cornell University Press, ITHACA, NEW YORK 14850

Oxford University Press

Science and the Federal Patron

By MICHAEL D. REAGAN, *University of California, Riverside.* "A pleasure to read. The book brings together in one place the entire current debate on science policy and the problem of establishing priorities within science. . . . Professor Reagan is to be congratulated for a careful and perceptive job of scholarship, as well as for many original insights that will undoubtedly influence future science policy."—ALVIN M. WEINBERG, Oak Ridge National Laboratory $7.50

Governing Elites

STUDIES IN TRAINING AND SELECTION

Edited by RUPERT WILKINSON, *University of Sussex, England.* "This collection of eight tight, scholarly essays is unexpectedly exciting. . . . Many of the objects of study are inherently exotic, like the American Indian tribes discussed by Henry Selby; some have fascination conferred upon them, as in Barnett's excellent article on various military-school traditions and Bolger's revision of the clichés about Athenian/Spartan training. All the essays are exceptionally readable."—*The Kirkus Reviews* $6.50

Social Change and History

ASPECTS OF THE WESTERN THEORY OF DEVELOPMENT

By ROBERT A. NISBET, *University of California, Riverside.* The primary purpose of this book is to set forth the essential sources and contexts of the Western idea of social development. In large part historical, in smaller part analytical and critical, it treats the concept of social change within the whole range of Western culture, from ancient times to the present. Dr. Nisbet takes particular issue with the notion that the idea of social development emerged in the nineteenth century as a by-product of the idea of biological evolution. $6.75

Terror and Resistance

A STUDY OF POLITICAL VIOLENCE

By E. V. WALTER. A pioneering work in an almost uncharted area of political idea and practice, Mr. Walter's book explores the paradox of political terror and explains why a terroristic government destroys part of a community in order to control the rest. "A very considerable contribution to an understanding of one of the dominant problems of our time at home and abroad. . . . I recommend it especially to all who hold positions of authority."—JOHN R. SEELEY, Dean, Center for the Study of Democratic Institutions, Santa Barbara, California $8.50

Immigration and Race Relations in Britain, 1960-1967

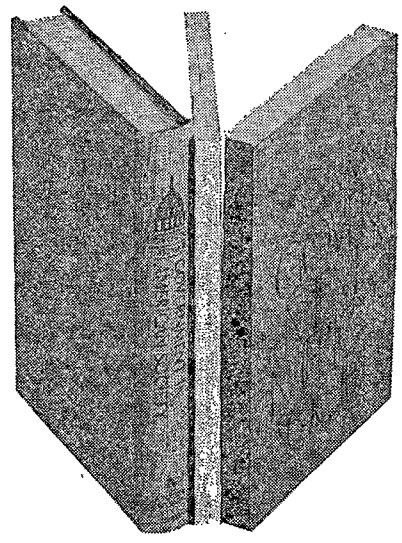
By SHEILA PATTERSON. This book is a comprehensive summary of race relations in Britain up to Autumn 1967. The four parts describe the background to recent commonwealth immigration, with chapters on official policies and practices, legislation and integration schemes; housing, employment, and education in relation to immigrants; non-governmental institutions, and extremist and racist movements; and other aspects such as health and crime. (*Institute of Race Relations.*) $10.50

Labour Disputes and Soviet Enterprise

By MARY McAULEY, *University of York.* It is often assumed that there are no labor disputes in Soviet industrial enterprises. Complex procedures exist, however, for the settlement of different types of disputes and recently Soviet specialists have paid increasing attention to the problem. The present work concentrates on the "sovnarkhoz" period and attempts to establish the extent and content of disputes and to assess the means used for their resolution. Field work in Leningrad in 1961-1963 provides much new information on the subject. $6.75

The British in Northern Nigeria

By ROBERT HEUSSLER, *Trenton State College.* The reasons why Britain established a protectorate over Northern Nigeria in 1900, the type of government she exercised, and the results achieved in her sixty-year stewardship are explored in this thorough-going study. Drawing on private and official papers in England and Nigeria and on extensive interviews, Professor Heussler pays particular attention to the working relationship between British and African officials and shows how European and African values were blended in the evolution of local administrations. $5.95



The Application of the European Convention on Human Rights

By J. E. S. FAWCETT, *All Souls College, Oxford.* The European Convention on Human Rights has been in operation since 1954 and over 3,000 applications have been brought under it. This survey takes the Convention article by article and clause by clause, describing and analyzing the interpretation that has been given to them by the Convention bodies, and also by national courts in the countries in which the Convention is part of the domestic law. $10.50

FOR AMERICAN GOVERNMENT COURSES

GOVERNMENT IN AMERICAN SOCIETY
By E. P. Dvorin and A. J. Misner, *California State College at Los Angeles*

This is a clear, concise introduction to the underlying assumptions, the concepts, and the basic facts required for an understanding of American government. Major institutions, processes, and contemporary issues are examined within the context of American society. *423 pp, 30 illus, $6.50*

GOVERNMENT IN AMERICAN SOCIETY: A Reader
Edited by E. P. Dvorin and A. J. Misner

The articles in this book are carefully selected to highlight and expand the key concepts and issues in this text and others. Readings are taken from magazines, speeches, hearings, books, and journals. *Paperbound, 339 pp, $3.50*

GOVERNMENT IN AMERICAN SOCIETY: A Student Participant Manual
By Sheridan and Edwina Hegland, *Palomar College*

Reinforcing and developing ideas and issues in the text, this manual offers an attitude and opinion questionnaire, semi-simulations and role-playing projects, and devices to help link course work with political coverage in the mass media.
Paperbound, 193 pp $2.95

PUBLIC OFFICIALS AND THE PRESS
By Delmer D. Dunn, *University of Georgia*

The primary purpose of the book is to delineate the role of the press in policy making by describing the work of the press and then tracing how public officials utilize that work in their own decision-making activities. The book will assist political scientists and journalists in making more accurate evaluations of the impact of the political reporter on the policy making process. *In Press (1969)*

FOR SOCIAL SCIENTISTS

HANDBOOK OF SOCIAL PSYCHOLOGY, Second Edition
Edited by Gardner Lindzey and Elliot Aronson, *University of Texas*

The second edition of this advanced textbook is designed to present a detailed and integrated picture of the current status of social psychology. Individual chapters are written by persons who are recognized for outstanding competence in the areas they treat.

Volume I: Systematic Positions
653 pp, 23 figs. $10.00

Volume II: Research Methods *819 pp, $12.50*

Volume III: The Individual in a Social Context
978 pp, 19 illus $13.50

Volume IV: Group Psychology and Phenomena of Interaction *694 pp, 24 illus $11.50*

Volume V: Applied Social Psychology
In press (1969)

CONTENT ANALYSIS FOR THE SOCIAL SCIENCES AND HUMANITIES
By Ole R. Holsti, *University of British Columbia*

An introduction and guide to content analysis as an approach to documentary research, this book is designed for the beginner as well as for the professional social scientist or humanist. The book integrates a model of the communication process, research designs, and techniques of content analysis.
235 pp, 28 illus $3.95

Addison-Wesley
PUBLISHING COMPANY, INC.

THE SIGN OF EXCELLENCE

New

Ahmedabad

A Study in Indian Urban History
K. L. Gillion

Ahmedabad, India's sixth city in size and one of the richest, was not a creation of British rule but an old center of trade and industry that adapted to the new age and became "The Manchester of India." Its recovery in the nineteenth century, after a decline in the previous one, contrasted with the experience of other Indian cities, many of which suffered a different fate under British rule. 1969 LC:68-25943 216 pages illustrations $7.00

The Nadars of Tamilnad

The Political Culture of a Community in Change
Robert L. Hardgrave, Jr.

In exploring the structural and cultural changes that the Nadars, a large South Indian caste, have experienced during the past 150 years, Mr. Hardgrave illuminates the interaction between caste and politics characteristic of Indian society. By scrutinizing a community undergoing change in the social and political space between the village and the larger society, he opens up a new perspective and method of analysis.

"One of the most important and exciting studies in the Indian field in recent years."
—Lloyd I. Rudolph 1969 LC:69-13726 336 pages $8.75

Politics and Social Conflict in South India

The Non-Brahman Movement and Tamil Separatism, 1916-1929
Eugene F. Irschick

Mr. Irschick breaks new ground in this strikingly intimate account of social and political conflict in early twentieth-century India. Although his findings have relevance far beyond Madras Presidency and the period under review, they concern essentially the non-Brahman political movement in South India following the inauguration of the Indian Home Rule movement in 1916. 1969 LC:68-31595 480 pages $9.75

British Orientalism and the Bengal Renaissance

The Dynamics of Indian Modernization, 1773-1835
David Kopf

Mr. Kopf is concerned mainly with the relationship of the Bengal Renaissance to the more general problem posed by the tension that has typically existed between tradition and modernity under British colonial rule. His book illuminates what has heretofore been an obscure area of modern Indian history. 1969 LC:69-13135 352 pages $8.50

Bureaucrats under Stress

Administrators and Administration in an Indian State
Richard P. Taub

Mr. Taub's book is firmly based in firsthand study, involving interviews with administrators as well as with the people with whom they must work, and examining both the attitudes men bring to their jobs and the nature of their tasks. The author is able to identify the main sources of strain that affect Indian administrators, and to demonstrate how these strains interact and limit potential performance.

1969 LC:68-58080 256 pages $6.75

Announcing

Formation of the

Center for Political Research

in Washington, D. C.

Publisher of *The National Journal*

Establishment of the Center for Political Research early in 1969 constitutes a major event in journalistic coverage of government and national politics. CPR, a private organization, plans to publish a new weekly publication, *The National Journal.*

CPR is staffed by about 50 professional journalists, analysts and researchers who will concentrate on detailed, unbiased and non-partisan political research and reporting. Dissemination of information will be accomplished through publications, conferences, special materials for radio and television and research under contract.

Thomas N. Schroth, for 13 years the Executive Editor of Congressional Quarterly, is director of the Center and editor of *The National Journal.*

Publication of *The National Journal* is scheduled for mid-summer, 1969. The weekly will concentrate on coverage of the Executive Branch of the federal government and will include special studies of major issues, detailed coverage of Congress and the Supreme Court and 50-state political coverage.

Associate Editors are: Neal R. Peirce, former political editor of CQ and author of "The People's President"; Cliff Sessions, former Director of Public Information at the Department of Justice; Joseph Foote, former law editor of CQ; and Roan Conrad and Timothy B. Clark, former legislative editors of CQ.

The National Journal will be distributed on a subscription basis only to political scientists and other scholars, libraries, news media, businessmen, lawyers and other persons interested in public affairs. It will be fully indexed and cross-referenced. It will carry no advertising.

Further details on request.

Cold War History

PRAGUE SPRING
By Z. A. B. Zeman

A Czechoslovakian-born historian's first-hand examination of the causes and course of Dubcek's reform movement. By citing manifestoes, speeches and articles that appeared in the Czechoslovak press, the author provides a detailed and dynamic picture of the liberalization movement. *Chronology, Maps.* $5.00

ANTI-BALLISTIC MISSILE: YES OR NO?
Introduction by Hubert H. Humphrey
Epilogue by William O. Douglas

This is the complete report of a debate conducted by the Center for the Study of Democratic Institutions. Advocates of the system are Donald Brennan, of the Hudson Institute, and retired Air Force General Leon Johnson; those opposed: Jerome Wiesner, former Presidential Science Advisor, and Senator George McGovern. *Appendixes, Chronology, Glossary.* $3.95; paper $1.75

ANATOMY OF ANTI-COMMUNISM
A Report Prepared for the Peace Education Division of the American Friends Service Committee

An in-depth analysis of anti-Communism, revealing its origins, methods, and role in American life. It shows how anti-Communism has often been used as a camouflage for conservative politics and suggests positive alternatives to an outmoded concept. *Bibliography.* $4.50; paper $1.50

POLAND: EAGLE IN THE EAST
By William Woods

A brilliant short history of one of the key satellite countries, containing hundreds of interviews with Polish citizens from all walks of life. From the disasters of World War II to its current resurgence as one of the strongest nations in Eastern Europe, Mr. Woods' account is "interesting and frequently absorbing."—*Publishers' Weekly.* *Photographs, Index, Maps.* $6.50

Integration and Community Building in Eastern Europe

Series Editor: Jan F. Triska

The recent invasion of Czechoslovakia and the Russian threats against Rumania have starkly underlined the relevance of this series' theme. The two studies described on this page provide concise, up-to-date analyses of the internal developments in these countries and of their relations with other communist states—especially the Soviet Union. (Studies of Bulgaria and Hungary are planned for the near future.)

The Czechoslovak Socialist Republic

By ZDENEK SUDA Dr. Suda's study is a cogent historical and analytical background for the recent events in Czechoslovakia. Focusing on the 1960's he shows that reform proceeded independently of development trends in Eastern Europe and that, in general, the communist system has been unable to accommodate Czechoslovakia's history and heterogeneous nature. After examining the complexities of the Czechoslovak position, Dr. Suda analyzes the Soviet intervention of 1968 and concludes with an appraisal of future prospects for Czechoslovak reforms. $6.50 cloth, $2.95 paper

The Socialist Republic of Rumania

By STEPHEN FISCHER-GALATI Rumania's problem is how to pursue independent policies without provoking the Soviet Union to military reaction. The author concludes that Rumania's future position in the communist party system hinges on the conflict with the Soviet Union. No meaningful reconciliation appears likely, he feels, while the present Rumanian and Soviet elites remain in power. Despite the invasion of Czechoslovakia, he thinks that the Rumanians will continue to pursue their independent course, but with greater caution. This course could lead to greater popular support and participation in the country's affairs. $6.00 cloth, $2.45 paper

Other titles in the series:

The German Democratic Republic

The U.S., India, and the Bomb

By SHELTON L. WILLIAMS The Nuclear Nonproliferation Treaty is based on the premise that U.S. security is threatened as more nations obtain nuclear weapons. The treaty can also strain our relations with countries such as India, which would like to avoid the expense of going nuclear but do not want to lose the option to do so. This timely study examines India's dilemma and her need for self-sufficiency. $2.45 paper

COOPERATION AND CONFLICT:
Readings in American Federalism

Edited by Daniel J. Elazar, Temple University
R. Bruce Carroll, Middlebury College
E. Lester Levine, Florida State University
Douglas St. Angelo, Florida State University

This is a comprehensive anthology of materials dealing with the several aspects of American federalism. Federalism is treated as an element of political conflict. Under this conflict there has been and continues to be extensive intermingling of functioning among government levels. This shared federalism is viewed historically, theoretically, fiscally, administratively and politically.

It is oriented toward delineating empirical realities but in a manner that synthesizes theory and practice in a meaningful way. The book's underlying premise is that federal principles and processes so permeate the American system of government that an understanding of federalism is necessary for the study of American government.

TABLE OF CONTENTS

Chapter 1. The American System as a Partnership
2. Basic Patterns of Partnership
3. The Views of the Policy Makers
4. The View from the States
5. The Grass Roots of American Federalism
6. The Dynamics of the Federal System

February 1969 c. 650 pages c. $9.50

The Loyola University Series in Modern Political Theory
OPEN SYSTEMS: Arenas for Political Action

Henry S. Kariel, University of Hawaii

This is Professor Kariel's exciting analysis of the problem of closure in American society and institutions. Professor Kariel's argument is that "politics *at its best* (not *all* politics) is a kind of play, of agonistic exertion, of free and self delighting action."

TABLE OF CONTENTS

Introduction

Chapter 1. The Personality System
2. The Social System
3. The System of Political Inquiry
4. Political Science as Public Action

May 1969 c. 160 pages c. $3.50 paper

VIETNAM:
Anatomy of a Conflict

Edited by Wesley R. Fishel, Michigan State University

Useful in courses in Politics of Southeast Asia or American Foreign Policy, this is a cogent, authoritative and balanced presentation of the Vietnam frustration. It contains 81 selections with various points of view. It sets forth background, history and contemporary analyses.

1968 879 pages $5.75 paper

PERSPECTIVES ON PUBLIC MANAGEMENT:
Cases and Learning Designs

Edited by Robert T. Golembiewski, University of Georgia

This unique approach to Public Administration contains 13 cases selected to illustrate some managerially-relevant process. Each case is preceded by a "learning design," i.e., suggested ways of using the case to highlight what is known about managerial processes and behavior.

1968 263 pages $4.75 paper

PUBLIC BUDGETING AND FINANCE:
Readings in Theory and Practice

Edited by Robert T. Golembiewski

An extraordinarily comprehensive collection of readings (47) emphasizing behavioral materials relevant to budgeting as well as technical and institutional features.

1968 592 pages $9.50

FEDERALISM:
Infinite Variety in Theory and Practice

Edited by Valerie Earle, Georgetown University

In a seven essay presentation, the first three examine American federalism, the next three federalism in Canada and Australia, West Germany and Latin America. The concluding essay discusses the future of federalism. The essay contributors, in addition to Valerie Earle, are Alpheus Mason, George Carey, William S. Livingston, Karl H. Cerny, Harry Kantor and Henry Teune.

1968 241 pages $3.75 paper

METROPOLIS IN CRISIS:
Social and Political Perspectives

Edited by Jeffrey K. Hadden, Case Western Reserve University
Louis H. Masotti, Case Western Reserve University
Calvin J. Larson, Purdue University.

The 44 selections in this reader are organized into five parts.

Part I, The Challenge of Metropolis, is a brief introduction to the problems and prospects of urban life. Part II, From Mudhuts to Megalopolis, traces the historical development of cities and elaborates the process and consequences of urbanization.

Part III, Ideological Perspectives, delineates the way man thinks and feels about the city. Part IV, Dimensions of the Crisis, looks at specific urban problems: race, housing, poverty, education, crime, transportation, air pollution and finance.

Finally, Part V, Adaptation, Innovation and Reform, examines the ability of the urban community to organize itself to meet the urban crisis.

LOOKING FOR A BOOK PUBLISHER?

It is no secret that publication is regarded as the foundation stone of a scholar's career. In order to gain recognition, prestige, and advancement, the scholar must seek publication.

Here at Exposition Press, we offer scholars a complete publishing service, under our special academic imprint, "Exposition-University Books." Though the proportion of scholarly publications in the lists of the trade houses is shrinking, due to economic pressures, many of our recent titles in the academic fields have gained popular reviews, professional recognition and steady sales. These books are the result of a publishing plan that is bringing a steady flow of scholarly writers to Exposition Press. They reflect the high editorial standards and quality of design and production which have won the respect of libraries, schools, book-sellers and critics. Ask for free catalogs.

FREE! The behind-the-scenes story of book publishing revealed in two fact-filled, illustrated brochures, containing a detailed description of our subsidy plan including a breakdown of contract terms and typical costs (in print for the first time). Copies are available on request. Your inquiries and manuscripts are invited. An editorial appraisal will be furnished promptly without obligation. References upon request.

West Africa under Colonial Rule
by Michael Crowder

This book, essentially a comparative study of the impact of French and British colonial rule on West Africa, traces the origins of European interest in the area, examines the period of conquest and occupation, and delineates the social changes brought about during the seventy-five year period of colonial rule. This study will be the standard work on the rise and fall of colonialism in all the vast areas of the West African coast. 530 pages $10.00

Russian Peasants and Soviet Power
by Moshe Lewin

The years 1928 and 1929 form a particularly significant period in Soviet history, one marked by tremendous forward thrust in industrialization, as well as by the mass collectivization of the peasantry. This study analyzes the problems of the period from the view of both the politician and the peasant. 556 pages $12.50

The Role of the Lawyer in the European Communities
by André Donner

The author examines the problems posed for the lawyer by the creation of the European Communities—the European Coal and Steel Community, the European Economic Community, and Euratom—and describes the role that the legal profession, especially in its judicial function, continues to play in their solution. 100 pages $3.50

A Landmark in American History

THE CREATION OF THE AMERICAN REPUBLIC

1776-1787

by Gordon S. Wood

The political system created by the Constitution of 1787 emerged out of an intellectual dialectic and political struggle which transformed the ideology of the Revolution. This unprecedented and comprehensive study describes in rich detail this critical period in American history.

"Wood has made a great contribution to our understanding of how we got the political system we live under ..... an understanding, thoughtful, and penetrating study."—W. Frank Craven

Power and Leadership in Pluralist Systems

Andrew S. McFarland

This is a critique and synthesis of previous research and theory on the nature of power in pluralist systems like that of the United States. The author is concerned to define power in such a system, to distinguish clearly between critical and routine decisions, and to clarify what is meant by leadership. $7.50

The Army and Politics in Argentina, 1928-1945

YRIGOYEN TO PERÓN

Robert A. Potash

This volume covers a critical period in which both the Army and the political process in Argentina underwent significant change. Particular attention is given to the evolution of the Army as an institution, the treatment accorded the armed forces under various governments, and the influence of Army officers on policy-making. $8.95

Politics in Modern Greece

Keith R. Legg

The process of modernization in Greece is unlikely to produce a truly modern political system—this is the conclusion that emerges from this detailed description and analysis of the political process in Greece. The book is based on a wide variety of historical materials, socio-anthropological studies, quantitative data, and personal interviews. August. About $10.00

Conflict and Consensus in Labour's Foreign Policy, 1914-1965

Michael R. Gordon

This study investigates the reasons behind the recurrent conflicts over foreign policy in the ranks of the British Labour Party. The author examines, in both theoretical and historical perspective, the basic nature of socialist, contrasted with traditional, foreign policy. $8.95

A Variety of History and Government Studies

The Liberal Democracy in World Affairs
FOREIGN POLICY AND NATIONAL DEFENSE

By LAURENCE I. RADWAY, Dartmouth College

A comprehensive analysis of the powers and perspectives of foreign and defense policy officials. The major focus is on foreign policy, with defense being strongly emphasized at four points: militarization of policy after 1950; the military community and policy formation; covert intervention, military aid, and deployment of United States forces as techniques of policy; and domestic impact of policy. Foreign policy is viewed as a joint product of international and domestic politics, and, accordingly, as shaped by a variety of interacting social forces. *The Scott, Foresman American Government Series. Just published, 216 pages, clothbound $4.50, softbound $2.25*

FROM AFRICA TO THE UNITED STATES, AND THEN:
A Concise Afro-American History

By KENNETH C. GOODE, University of California, Berkeley
Consulting Editor, WINTHROP JORDAN, University of California, Berkeley

This highly adaptable, brief, clearly written text provides a chronological history of the American Negro from their origin in West Africa to the post World War II years. Extensive bibliographies at the end of each chapter offer suggestions for supplemental readings for both teacher and student. The text is suitable for short courses in Afro-American history or as a supplementary text in American history courses. *Just published, 160 pages, softbound $1.95*

SOURCES OF THE AMERICAN REPUBLIC
A Documentary History of Politics, Society, and Thought

Volume II, Revised Edition
Edited by MARVIN MEYERS, Brandeis University
JOHN G. CAWELTI, The University of Chicago
ALEXANDER KERN, The University of Iowa

This new revision of a successful book provides an outstanding history of the period from 1865 to the present day. Primary source readings and selected historians' interpretations are presented within an extensive framework of editorial introductions and headnotes. Material has been updated in light of recent events, and emphasis is placed on the social, cultural, and intellectual aspects of history. *Just published, 512 pages, softbound $4.95*

ETHNIC POLITICS IN AMERICA

By EDGAR LITT, The University of Connecticut

This book provides a thorough analysis of the role of ethnicity in American politics, discussing its origins, persistence, manifestions, and variety. The analysis includes a discussion of the patterns of action into which ethnicity is channelled in our system and provides in depth studies of these patterns (particularly where the Jew, the Irish-Catholic, or the Negro is concerned). The author also summarizes the current crisis of ethnic politics and the degree to which its past patterns effect recent problems. *The Scott, Foresman American Government Series. Fall, approx. 160 pages, softbound $2.25 tent.*

new books of major importance

WHITE ETHICS AND BLACK POWER: The Emergence of The West Side Organization

William W. Ellis, Northwestern University

The first case study of how a group achieves and uses power in a black community, this book tells the story of the West Side Organization of Chicago. The Organization represents a new style in community organizations, one that uses all leadership skills in the community whether gained legally or illegally. Its leaders (most of them ex-convicts) are concerned with making local organization the ruling force in the community and with creative action designed to help their black constituency. *224 pp. $5.95. October.*

ADMINISTRATIVE REFORM

Gerald E. Caiden, University of California, Berkeley

The first systematic treatment of administrative reform for the fields of public and private administration, this book provides a careful examination of the diverse, interdisciplinary literature on the subject. Most important, it identifies and develops the most promising approaches toward a unified theory. *240 pp. $6.50. September.*

POLITICS OF SOCIAL RESEARCH: An Inquiry into the Ethics and Responsibilities of Social Scientists

Ralph L. Beals, University of California, Berkeley

A distinguished and senior social scientist long concerned with the major issues of ethics and public policy discusses the serious ethical problems that social scientists confront in conducting research sponsored by or otherwise involving government agencies—our own and those of the other countries where U.S. research is conducted. *256 pp. $6.95. July.*

THE CONCEPT OF COMMUNITY: Readings with Interpretations

edited by David W. Minar, University of Washington, and Scott Greer, Northwestern University

Thirty-six carefully selected readings explore the meaning and dimensions of "community," with emphasis on community as an aspect of social organization and political life. Drawn from a wide variety of sources—both historical and contemporary—readings in political philosophy, empirical social science, political science, anthropology, sociology, history, and literature reflect a broad spectrum of attitudes and approaches. *384 pp. Clothbound, $7.95. Paperbound, $4.95. Just published.*

THE LOGIC OF SOCIAL INQUIRY

Scott Greer, Northwestern University

An examination of the rationale for social science from the perspective of the working social scientist, this book attempts to establish the fullest meaning of social science by exploring the roots of meaning in the basic human processes of knowing, reasoning, and judging. *224 pp. $5.95. Just published.*

Paperbacks from Prentice-Hall for your courses in Political Science

Private Enterprise and Public Interest

By Gordon C. Bjork, Linfield College

This book examines the assumptions which underly the power of the state, the corporation, the labor union and the individual in the United States. The author examines the definition which American society has developed for the "rights" of individuals and groups in the economic process, and contrasts it with the definition used by earlier western societies and the contemporary Soviet Union. *January 1969, 243 pp., paper $3.95 (71091-3)*

The Corporation in American Politics

By Edwin M. Epstein, University of California, Berkeley

Presents a rigorous analysis of the corporation's political role. Edwin M. Epstein examines the historical developments and present status of political behavior by business corporations, presenting the arguments raised in favor of and in opposition to corporate political involvement. He analyzes the implication of such behavior for a pluralistic democracy. The book is not an examination of the political behavior of individuals within a corporation but rather a study of politics as an activity of the enterprise. The importance of the book is accentuated by the increasing growth of ever larger corporate units whose activities affect all aspects of American society. *June 1969, approx. 360 pp., paper $4.95 (17315-3)*

Private Enterprise in the Developing Countries

By David B. Zenoff, Columbia University

A collection of case studies focusing on private interprise in industrializing economics is presented in this new text. It is the author's belief that the use of these cases to supplement textbooks in the study of the economic development process and the conduct of business across national borders will be extremely valuable and will benefit the curriculum of many types of educational institutions. The student, the observer, and the expert must each have an appreciation of the outlook of the individual entrepreneur in a developing country, just as each must have a well grounded understanding of the overall operation of the economy and its aggregate problems. *June 1969, approx. 304 pp., paper $5.95 (70190-4)*

WILLIAM R. POLK

THE UNITED STATES AND THE ARAB WORLD

Revised Edition

The first edition of this book, published in 1965, was praised as a comprehensive and illuminating account of the Arab world and Arab-American relations. Because of the drastic changes in the Middle East, Polk has updated and enlarged his study with a new preface, three new chapters, and two additional maps. *American Foreign Policy Library.* $7.95

JAMES W. GOULD

THE UNITED STATES AND MALAYSIA

This volume is the first comprehensive analysis of American-Malaysian relations and Malaysian foreign policy. A discerning examination of Malaysia, Singapore, and Brunei, it focuses on American involvement in the region and the political, cultural, and economic accomplishments of its three divergent races. *American Foreign Policy Library.* $6.95

VERA MICHELES DEAN

NEW PATTERNS OF DEMOCRACY IN INDIA

Second Edition

Mrs. Dean has expanded and brought up to date her interpretation of India and its future. Summarizing the social, economic, and political progress in India over the last decade, she concludes that India will continue on its path toward democracy, withstanding the threat of Communism. $5.95

HENRY WELLS

THE MODERNIZATION OF PUERTO RICO

A Political Study of Changing Values and Institutions

Puerto Rico has transformed itself into a self-confident industrial society through peaceful rather than violent revolution. Emphasizing the effective roles of the political leaders, Mr. Wells examines the modernization process in the context of the sociocultural, economic, and political background of the Puerto Rican people. $9.95

NOTHING STANDS STILL

Essays by Arthur M. Schlesinger

This volume brings together eleven essays never before collected in book form. Written between 1929 and 1965, these distinguished pieces demonstrate Mr. Schlesinger's belief that "nothing stands still"—that historians must maintain a "liberal, flexible attitude." They also illustrate his hopes for American democracy. *Belknap Press.* $6.00

ARTHUR M. SCHLESINGER

Introduction by Arthur M. Schlesinger, Jr.

GUINEAS AND GUNPOWDER

British Foreign Aid in the Wars with France, 1793-1815

This book examines the evolution of the British foreign aid program from its beginnings in 1793 to the Battle of Waterloo. The author shows that Britain's subsidy policy, in many ways a prototype of those used during World Wars I and II, was reluctantly undertaken and reached massive proportions only near the end of the struggle. $11.00

JOHN M. SHERWIG

THE RUMANIAN NATIONAL MOVEMENT IN TRANSYLVANIA, 1780-1849

Long before Rumania existed as a sovereign state, Rumanians struggled for national identity in Transylvania, an area in Eastern Europe of great ethnic and cultural diversity. Mr. Hitchins has written the first systematic analysis of the development of the leadership, techniques, and literary and political manifestations that embodied their national consciousness. $8.00

KEITH HITCHINS

THE SOVIET PREFECTS

Mr. Hough examines the postwar role of the local Party organs in Soviet industrial decision-making, emphasizing administrative rather than political concerns. He demonstrates that there is more order and rationality in the network of overlapping Party and state heirarchies than is usually assumed. *Russian Research Center Studies,* 58. $12.50

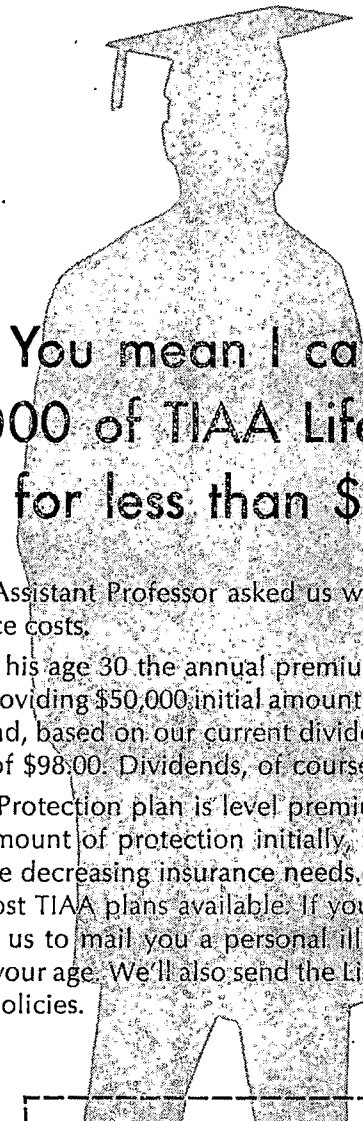
Current and Classic
By RICHARD N. SWIFT, *New York University*

"It is an excellent piece of work, very carefully done, with precision and control; in my judgment, Swift has done a commendable job. . . . I think many American teachers would welcome Swift's book as an admirable teaching tool."—Richard A. Falk, Princeton University.

1969 558 pages $10.95

ECONOMIC DEVELOPMENT
The Cultural Context
By THOMAS R. DEGREGORI, *University of Houston; and*
ORIOL PI-SUNYER, *University of Massachusetts*



One of the first general and systematized accounts on all phases of the modernization of underdeveloped societies, this book uses an interdisciplinary approach to investigate the process of economic, social, and technological change in primitive and traditional societies.

1969 138 pages Paper: $3.50 Cloth: $6.95

You mean I can get $50,000 of TIAA Life insurance for less than $100?

That's what an Assistant Professor asked us when he heard about TIAA's low life insurance costs.

It's true. At his age 30 the annual premium for a 20-Year Home Protection policy providing $50,000 initial amount of insurance is $159.00. The first-year dividend, based on our current dividend scale, is $61.00, making a net payment of $98.00. Dividends, of course, are not guaranteed.

The Home Protection plan is level premium Term insurance providing its largest amount of protection initially, reducing by schedule each year to recognize decreasing insurance needs. This is just one example of the many low-cost TIAA plans available. If you need more protection for your family, ask us to mail you a personal illustration with figures for a policy issued at your age. We'll also send the Life Insurance Guide describing other TIAA policies.

ELIGIBILITY

Eligibility to apply for this or other TIAA life insurance is limited to persons employed at the time of application by a college, university, private school, or other nonprofit educational or scientific institution that qualifies for TIAA eligibility.

Perspectives on political science

Peter H. Odegard's
THE AMERICAN REPUBLIC
ITS GOVERNMENT AND POLITICS, SECOND EDITION
with Hans H. Baerwald and William C. Havard

A rigorous study of institutions and political practices at all levels of American government. While retaining the historical and comparative analysis characteristic of the first edition, the Second Edition has been thoroughly revised and reorganized and incorporates original research, both institutional and behavioral. Theoretical and comparative material is introduced to show why the American system works as it does in the light of social and historical circumstances. *1969. 899 pp.; $9.95.* To accompany the text: HANDBOOK OF AMERICAN GOVERNMENT (for the student) and Instructor's Manual, both by David Barney. HANDBOOK: $3.95 (tentative)

Peter H. Odegard
AMERICAN GOVERNMENT
READINGS AND DOCUMENTS, SECOND EDITION

An authoritative and wide-ranging collection of readings to accompany any standard text in American government, including THE AMERICAN REPUBLIC. Headnotes give historical, constitutional, and political perspective to the documentary materials. *1966. 640 pp.; $5.50 paper*

Thomas E. Cronin and Sanford D. Greenberg
THE PRESIDENTIAL ADVISORY SYSTEM

For the first time, two recent White House aides focus specifically on the presidential advisory system through essays and research papers by political scientists as well as former science, economic, budget, and foreign policy advisors. *1969. 357 pp.; $6.95 cloth; $3.95 paper*

Ralph K. Huitt and Robert L. Peabody
CONGRESS: TWO DECADES OF ANALYSIS

Six landmark articles by Dr. Huitt study the U.S. Senate and the executive-legislative process. An original introductory essay by Dr. Peabody comprehensively assesses Congressional research since World War II. Selective bibliography. *1969. 241 pp.; $3.50 paper*

Dan N. Jacobs
THE NEW COMMUNISMS

Original essays by noted authorities focus on the breakdown in the solidarity of the international Communist movement. Treats the ideological and the practical factors that triggered this dissolution; examines the varieties of Communism, based on national interest, that have evolved in various countries. Extensive introduction provides a framework. *1969. 326 pp.; $8.00 cloth; $5.00 paper*

Howard A. Scarrow
COMPARATIVE POLITICAL ANALYSIS
AN INTRODUCTION

Unites the comparative study of national and subnational political systems; delineates the functional and causal modes of explanatory analysis; shows the relationship between the two modes of explanatory analysis and the methodological problems of evidence; discusses problems surrounding some of the field's major concepts; shows the relationship of political science to sociology; discusses comparative politics as a specialized field within political science. *1969. 146 pp.; $2.95 paper*

EXECUTIVE OFFICE

Executive Director, APSA
1527 New Hampshire Ave., N.W.
Washington, D.C. 20036

THE AMERICAN POLITICAL SCIENCE REVIEW, published quarterly during the months of March, June, September, and December, is supplied to all APSA members. Individual and institutional memberships are $15.00 a year ($6.00 for graduate and undergraduate students; five-year limitation). Foreign currency at the official exchange rate will be accepted for foreign subscriptions and foreign membership fees. The equivalent of $1 for additional postage should be added for foreign subscriptions.

Current issues are priced at $3.75 per copy; for *back issues* prior to 1963 address Johnson Reprint Corp., 111 5th Ave., New York, N.Y. 10003; subsequent to 1963 send request directly to the American Political Science Association.

Applications for membership, orders for the REVIEW, and remittances should be addressed to the Executive Director, The American Political Science Association, 1527 New Hampshire Ave., N.W., Washington, D.C. 20036. *Notices of change of address* should be received in the Washington office by the 25th day of the month before publication.

Address correspondence about contributions to the REVIEW to Austin Ranney, North Hall, University of Wisconsin, Madison, Wis. 53706. All manuscripts should be submitted IN DUPLICATE. They should be double-spaced and may be in typed, mimeographed, hectographed, or other legible form. Footnotes should appear at the end of the manuscript, not at the bottom of the page.

Since manuscripts are sent out anonymously for editorial evaluation, the author's name and affiliations should appear only on a separate covering page. All footnotes identifying the author should also appear on a separate page.

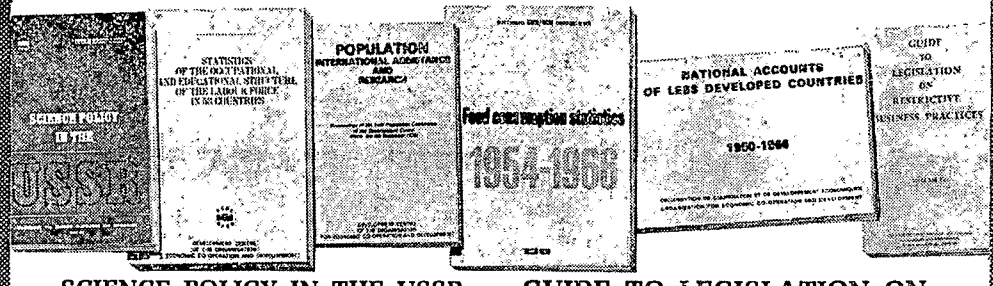
Address books intended for review to Richard F. Fenno, 575 Mount Hope Avenue, Rochester, New York 14620; information, including News and Notes, for the Association's newsletter *P. S.*, should be sent to 1527 New Hampshire Avenue, N.W., Washington, D.C. 20036; advertising, reprint and circulation correspondence to the Executive Director at the Washington office.

Articles and notes appearing in the REVIEW before the June, 1953 issue were indexed in *The Reader's Guide to Periodical Literature. The International Political Science Abstracts* and the *International Index to Periodicals* index current issues. Microfilm of the REVIEW, beginning with Volume 1, may be obtained from University Microfilms, 313 North First Street, Ann Arbor, Michigan. A *Cumulative Index* of the REVIEW, Volumes 1-57: 1906-1963, may be obtained from Northwestern University Press, 1735 Benson, Evanston, Illinois.

Office of publication: Curtis Reed Plaza, Menasha, Wisconsin.

Foreign Agent: P. S. King and Staples, Ltd., Great Smith Street, Westminster, London.

Second class postage paid at Menasha, Wisconsin. Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized May 12, 1926.



Printed in the United States of America by George Banta Company, Inc., Menasha, Wisconsin.

VOL. LXIII SEPTEMBER, 1969 NO. 3

CONCEPTUAL MODELS AND THE CUBAN MISSILE CRISIS*

GRAHAM T. ALLISON
Harvard University

The Cuban missile crisis is a seminal event. For thirteen days of October 1962, there was a higher probability that more human lives would end suddenly than ever before in history. Had the worst occurred, the death of 100 million Americans, over 100 million Russians, and millions of Europeans as well would make previous natural calamities and inhumanities appear insignificant. Given the probability of disaster—which President Kennedy estimated as "between 1 out of 3 and even"—our escape seems awesome.[1] This event symbolizes a central, if only partially thinkable, fact about our existence. That such consequences could follow from the choices and actions of national governments obliges students of government as well as participants in governance to think hard about these problems.

Improved understanding of this crisis depends in part on more information and more probing analyses of available evidence. To contribute to these efforts is part of the purpose of this study. But here the missile crisis serves primarily as grist for a more general investigation. This study proceeds from the premise that marked improvement in our understanding of such events depends critically on more self-consciousness about what observers bring to the analysis. What each analyst sees and judges to be important is a function not only of the evidence about what happened but also of the "conceptual lenses" through which he looks at the evidence. The principal purpose of this essay is to explore some of the fundamental assumptions and categories employed by analysts in thinking about problems of governmental behavior, especially in foreign and military affairs.

The general argument can be summarized in three propositions:

1. Analysts think about problems of foreign and military policy in terms of largely implicit conceptual models that have significant consequences for the content of their thought.[2]

Though the present product of foreign policy analysis is neither systematic nor powerful, if one carefully examines explanations produced by analysts, a number of fundamental similarities emerge. Explanations produced by particular analysts display quite regular, predictable features. This predictability suggests a substructure. These regularities reflect an analyst's assumptions about the character of puzzles, the categories in which problems should be considered, the types of evidence that are relevant, and the determinants of occurrences. The first proposition is that clusters of such related assumptions constitute basic frames of reference or conceptual models in terms of which analysts

* A longer version of this paper was presented at the Annual Meeting of the American Political Science Association, September, 1968 (reproduced by the Rand Corporation, P-3919). The paper is part of a larger study, scheduled for publication in 1969 under the title *Bureaucracy and Policy: Conceptual Models and the Cuban Missile Crisis*. For support in various stages of this work I am indebted to the Institute of Politics in the John F. Kennedy School of Government and the Center for International Affairs, both at Harvard University, the Rand Corporation, and the Council on Foreign Relations. For critical stimulation and advice I am especially grateful to Richard E. Neustadt, Thomas C. Schelling, Andrew W. Marshall, and Elisabeth K. Allison.

[1] Theodore Sorensen, *Kennedy* (New York, 1965), p. 705.

[2] In attempting to understand problems of foreign affairs, analysts engage in a number of related, but logically separable enterprises: (a) description, (b) explanation, (c) prediction, (d) evaluation, and (e) recommendation. This essay focuses primarily on explanation (and by implication, prediction).

both ask and answer the questions: What happened? Why did the event happen? What will happen?[3] Such assumptions are central to the activities of explanation and prediction, for in attempting to explain a particular event, the analyst cannot simply describe the full state of the world leading up to that event. The logic of explanation requires that he single out the relevant, important determinants of the occurrence.[4] Moreover, as the logic of prediction underscores, the analyst must summarize the various determinants as they bear on the event in question. Conceptual models both fix the mesh of the nets that the analyst drags through the material in order to explain a particular action or decision and direct him to cast his net in select ponds, at certain depths, in order to catch the fish he is after.

2. Most analysts explain (and predict) the behavior of national governments in terms of various forms of one basic conceptual model, here entitled the Rational Policy Model (Model I).[5]

In terms of this conceptual model, analysts attempt to understand happenings as the more or less purposive acts of unified national governments. For these analysts, the point of an explanation is to show how the nation or government could have chosen the action in question, given the strategic problem that it faced. For example, in confronting the problem posed by the Soviet installation of missiles in Cuba, rational policy model analysts attempt to show how this was a reasonable act from the point of view of the Soviet Union, given Soviet strategic objectives.

3. Two "alternative" conceptual models, here labeled an Organizational Process Model (Model II) and a Bureaucratic Politics Model (Model III) provide a base for improved explanation and prediction.

Although the standard frame of reference has proved useful for many purposes, there is powerful evidence that it must be supplemented, if not supplanted, by frames of reference which focus upon the large organizations and political actors involved in the policy process. Model I's implication that important events have important causes, i.e., that monoliths perform large actions for big reasons, must be balanced by an appreciation of the facts (a) that monoliths are black boxes covering various gears and levers in a highly differentiated decision-making structure, and (b) that large acts are the consequences of innumerable and often conflicting smaller actions by individuals at various levels of bureaucratic organizations in the service of a variety of only partially compatible conceptions of national goals, organizational goals, and political objectives. Recent developments in the field of organization theory provide the foundation for the second model. According to this organizational process model, what Model I categorizes as "acts" and "choices" are instead *outputs* of large organizations functioning according to certain regular patterns of behavior. Faced with the problem of Soviet missiles in Cuba, a Model II analyst identifies the relevant organizations and displays the patterns of organizational behavior from which this action emerged. The third model focuses on the internal politics of a government. Happenings in foreign affairs are understood, according to the bureaucratic politics model, neither as choices nor as outputs. Instead, what happens is categorized as *outcomes* of various overlapping bargaining games among players arranged hierarchically in the national government. In confronting the problem posed by Soviet missiles in Cuba, a Model III analyst displays the perceptions, motivations, positions, power, and maneuvers of principal players from which the outcome emerged.[6]

[3] In arguing that explanations proceed in terms of implicit conceptual models, this essay makes no claim that foreign policy analysts have developed any satisfactory, empirically tested theory. In this essay, the use of the term "model" without qualifiers should be read "conceptual scheme."

[4] For the purpose of this argument we shall accept Carl G. Hempel's characterization of the logic of explanation: an explanation "answers the question, '*Why* did the explanadum-phenomenon occur?' by showing that the phenomenon resulted from particular circumstances, specified in C_1, C_2, . . . C_k, in accordance with laws L_1, L_2, . . . L_r. By pointing this out, the argument shows that, given the particular circumstances and the laws in question, the occurrence of the phenomenon was to be *expected;* and it is in this sense that the explanation enables us to understand why the phenomenon occurred." *Aspects of Scientific Explanation* (New York, 1965), p. 337. While various patterns of explanation can be distinguished, *viz.,* Ernest Nagel, *The Structure of Science: Problems in the Logic of Scientific Explanation,* New York, 1961), satisfactory scientific explanations exhibit this basic logic. Consequently prediction is the converse of explanation.

[5] Earlier drafts of this argument have aroused heated arguments concerning proper names for these models. To choose names from ordinary language is to court confusion, as well as familiarity. Perhaps it is best to think of these models as I, II, and III.

[6] In strict terms, the "outcomes" which these three models attempt to explain are essentially actions of national governments, i.e., the sum of activities of all individuals employed by a government relevant to an issue. These models focus not on a state of affairs, i.e., a full description of the

A central metaphor illuminates differences among these models. Foreign policy has often been compared to moves, sequences of moves, and games of chess. If one were limited to observations on a screen upon which moves in the chess game were projected without information as to how the pieces came to be moved, he would assume—as Model I does—that an individual chess player was moving the pieces with reference to plans and maneuvers toward the goal of winning the game. But a pattern of moves can be imagined that would lead the serious observer, after watching several games, to consider the hypothesis that the chess player was not a single individual but rather a loose alliance of semi-independent organizations, each of which moved its set of pieces according to standard operating procedures. For example, movement of separate sets of pieces might proceed in turn, each according to a routine, the king's rook, bishop, and their pawns repeatedly attacking the opponent according to a fixed plan. Furthermore, it is conceivable that the pattern of play would suggest to an observer that a number of distinct players, with distinct objectives but shared power over the pieces, were determining the moves as the resultant of collegial bargaining. For example, the black rook's move might contribute to the loss of a black knight with no comparable gain for the black team, but with the black rook becoming the principal guardian of the "palace" on that side of the board.

The space available does not permit full development and support of such a general argument.[7] Rather, the sections that follow simply sketch each conceptual model, articulate it as an analytic paradigm, and apply it to produce an explanation. But each model is applied to the same event: the U.S. blockade of Cuba during the missile crisis. These "alternative explanations" of the same happening illustrate differences among the models—*at work*.[8] A crisis decision, by a small group of men in the context of ultimate threat, this is a case of the rational policy model *par excellence*. The dimensions and factors that Models II and III uncover in this case are therefore particularly suggestive. The concluding section of this paper suggests how the three models may be related and how they can be extended to generate predictions.

MODEL I: RATIONAL POLICY

RATIONAL POLICY MODEL ILLUSTRATED

Where is the pinch of the puzzle raised by the *New York Times* over Soviet deployment of an antiballistic missile system?[9] The question, as the *Times* states it, concerns the Soviet Union's objective in allocating such large sums of money for this weapon system while at the same time seeming to pursue a policy of increasing détente. In former President Johnson's words, "the paradox is that this [Soviet deployment of an antiballistic missile system] should be happening at a time when there is abundant evidence that our mutual antagonism is beginning to ease."[10] This question troubles people primarily because Soviet antiballistic missile deployment, and evidence of Soviet actions towards détente, when juxtaposed in our implicit model, produce a question. With reference to what objective could the Soviet government have rationally chosen the simultaneous pursuit of these two courses of actions? This question arises only when the analyst attempts to structure events as purposive choices of consistent actors.

world, but upon national decision and implementation. This distinction is stated clearly by Harold and Margaret Sprout, "Environmental Factors on the Study of International Politics," in James Rosenau (ed.), *International Politics and Foreign Policy* (Glencoe, Illinois, 1961), p. 116. This restriction excludes explanations offered principally in terms of international systems theories. Nevertheless, this restriction is not severe, since few interesting explanations of occurrences in foreign policy have been produced at that level of analysis. According to David Singer, "The nation state —our primary actor in international relations . . . is clearly the traditional focus among Western students and is the one which dominates all of the texts employed in English-speaking colleges and universities." David Singer, "The Level-of-Analysis Problem in International Relations," Klaus Knorr and Sidney Verba (eds.), *The International System* (Princeton, 1961). Similarly, Richard Brody's review of contemporary trends in the study of international relations finds that "scholars have come increasingly to focus on acts of nations. That is, they all focus on the behavior of nations in some respect. Having an interest in accounting for the behavior of nations in common, the prospects for a common frame of reference are enhanced."

[7] For further development and support of these arguments see the author's larger study, *Bureaucracy and Policy: Conceptual Models and the Cuban Missile Crisis* (forthcoming). In its abbreviated form, the argument must, at some points, appear overly stark. The limits of space have forced the omission of many reservations and refinements.

[8] Each of the three "case snapshots" displays the work of a conceptual model as it is applied to explain the U.S. blockade of Cuba. But these three cuts are primarily exercises in hypothesis generation rather than hypothesis testing. Especially when separated from the larger study, these accounts may be misleading. The sources for these accounts include the full public record plus a large number of interviews with participants in the crisis.

[9] *New York Times*, February 18, 1967.

[10] *Ibid.*

How do analysts attempt to explain the Soviet emplacement of missiles in Cuba? The most widely cited explanation of this occurrence has been produced by two RAND Sovietologists, Arnold Horelick and Myron Rush.[11] They conclude that "the introduction of strategic missiles into Cuba was motivated chiefly by the Soviet leaders' desire to overcome . . . the existing large margin of U.S. strategic superiority."[12] How do they reach this conclusion? In Sherlock Holmes style, they seize several salient characteristics of this action and use these features as criteria against which to test alternative hypotheses about Soviet objectives. For example, the size of the Soviet deployment, and the simultaneous emplacement of more expensive, more visible intermediate range missiles as well as medium range missiles, it is argued, exclude an explanation of the action in terms of Cuban defense—since that objective could have been secured with a much smaller number of medium range missiles alone. Their explanation presents an argument for one objective that permits interpretation of the details of Soviet behavior as a value-maximizing choice.

How do analysts account for the coming of the First World War? According to Hans Morgenthau, "the first World War had its origin exclusively in the fear of a disturbance of the European balance of power.[13] In the period preceding World War I, the Triple Alliance precariously balanced the Triple Entente. If either power combination could gain a decisive advantage in the Balkans, it would achieve a decisive advantage in the balance of power. "It was this fear," Morgenthau asserts, "that motivated Austria in July 1914 to settle its accounts with Serbia once and for all, and that induced Germany to support Austria unconditionally. It was the same fear that brought Russia to the support of Serbia, and France to the support of Russia."[14] How is Morgenthau able to resolve this problem so confidently? By imposing on the data a "rational outline."[15] The value of this method, according to Morgenthau, is that "it provides for rational discipline in action and creates astounding continuity in foreign policy which makes American, British, or Russian foreign policy appear as an intelligent, rational continuum . . . regardless of the different motives, preferences, and intellectual and moral qualities of successive statesmen."[16]

Stanley Hoffmann's essay, "Restraints and Choices in American Foreign Policy" concentrates, characteristically, on "deep forces": the international system, ideology, and national character—which constitute restraints, limits, and blinders.[17] Only secondarily does he consider decisions. But when explaining particular occurrences, though emphasizing relevant constraints, he focuses on the choices of nations. American behavior in Southeast Asia is explained as a reasonable choice of "downgrading this particular alliance (SEATO) in favor of direct U.S. involvement," given the constraint: "one is bound by one's commitments; one is committed by one's mistakes."[18] More frequently, Hoffmann uncovers confusion or contradiction in the nation's choice. For example, U.S. policy towards underdeveloped countries is explained as "schizophrenic."[19] The method employed by Hoffmann in producing these explanations as rational (or irrational) decisions, he terms "imaginative reconstruction."[20]

Deterrence is the cardinal problem of the contemporary strategic literature. Thomas Schelling's *Strategy of Conflict* formulates a number of propositions focused upon the dynamics of deterrence in the nuclear age. One of the major propositions concerns the stability of the balance of terror: in a situation of mutual deterrence, the probability of nuclear war is reduced not by the "balance" (the sheer equality of the situation) but rather by the *stability* of the balance, i.e., the fact that neither opponent in striking first can destroy the other's ability to strike back.[21] How does Schelling support this proposition? Confidence in the contention stems not from an inductive canvass of a large number of previous cases, but rather from two calculations. In a situation of "balance" but vulnerability, there are values for which a rational opponent could choose to strike first, e.g., to destroy enemy capabilities to retaliate. In a

[21] Thomas Schelling, *The Strategy of Conflict*, (New York, 1960), p. 232. This proposition was formulated earlier by A. Wohlstetter, "The Delicate Balance of Terror," *Foreign Affairs* (January, 1959).

"stable balance" where no matter who strikes first, each has an assured capability to retaliate with unacceptable damage, no rational agent could choose such a course of action (since that choice is effectively equivalent to choosing mutual homicide). Whereas most contemporary strategic thinking is driven *implicitly* by the motor upon which this calculation depends, Schelling explicitly recognizes that strategic theory does assume a model. The foundation of a theory of strategy is, he asserts: "the assumption of rational behavior—not just of intelligent behavior, but of behavior motivated by conscious calculation of advantages, calculation that in turn is based on an explicit and internally consistent value system."[22]

What is striking about these examples from the literature of foreign policy and international relations are the similarities among analysts of various styles when they are called upon to produce explanations. Each assumes that what must be explained is an action, i.e., the realization of some purpose or intention. Each assumes that the actor is the national government. Each assumes that the action is chosen as a calculated response to a strategic problem. For each, explanation consists of showing what goal the government was pursuing in committing the act and how this action was a reasonable choice, given the nation's objectives. This set of assumptions characterizes the rational policy model. The assertion that Model I is the standard frame of reference implies no denial of highly visible differences among the interests of Sovietologists, diplomatic historians, international relations theorists, and strategists. Indeed, in most respects, differences among the work of Hans Morgenthau, Stanley Hoffmann, and Thomas Schelling could not be more pointed. Appreciation of the extent to which each relies predominantly on Model I, however, reveals basic similarities among Morgenthau's method of "rational reenactment," Hoffmann's "imaginative reconstruction," and Schelling's "vicarious problem solving;" family resemblances among Morgenthau's "rational statesman," Hoffmann's "roulette player," and Schelling's "game theorist."[23]

Most contemporary analysts (as well as laymen) proceed predominantly—albeit most often implicitly—in terms of this model when attempting to explain happenings in foreign affairs. Indeed, that occurrences in foreign affairs are the *acts* of *nations* seems so fundamental to thinking about such problems that this underlying model has rarely been recognized: to explain an occurrence in foreign policy simply means to show how the government could have rationally chosen that action.[24] These brief examples illustrate five uses of the model. To prove that most analysts think largely in terms of the rational policy model is not possible. In this limited space it is not even possible to illustrate the range of employment of the framework. Rather, my purpose is to convey to the reader a grasp of the model and a challenge: let the reader examine the literature with which he is most familiar and make his judgment.

The general characterization can be sharpened by articulating the rational policy model as an "analytic paradigm" in the technical sense developed by Robert K. Merton for sociological analyses.[25] Systematic statement of basic assumptions, concepts, and propositions employed by Model I analysts highlights the distinctive thrust of this style of analysis. To articulate a largely implicit framework is of necessity to caricature. But caricature can be instructive.

RATIONAL POLICY PARADIGM

I. Basic Unit of Analysis: Policy as National Choice

Happenings in foreign affairs are conceived as actions chosen by the nation or national

[22] Schelling, *op. cit.*, p. 4.

[23] See Morgenthau, *op. cit.*, p. 5; Hoffmann, *Contemporary Theory*, pp. 178–179; Hoffmann, "Roulette in the Cellar," *The State of War;* Schelling, *op. cit.*

[24] The larger study examines several exceptions to this generalization. Sidney Verba's excellent essay "Assumptions of Rationality and Non-Rationality in Models of the International System" is less an exception than it is an approach to a somewhat different problem. Verba focuses upon models of rationality and irrationality of *individual* statesmen: in Knorr and Verba, *The International System.*

[25] Robert K. Merton, *Social Theory and Social Structures* (Revised and Enlarged Edition; New York, 1957), pp. 12–16. Considerably weaker than a satisfactory theoretical model, paradigms nevertheless represent a short step in that direction from looser, implicit conceptual models. Neither the concepts nor the relations among the variables are sufficiently specified to yield propositions deductively. "Paradigmatic Analysis" nevertheless has considerable promise for clarifying and codifying styles of analysis in political science. Each of the paradigms stated here can be represented rigorously in mathematical terms. For example, Model I lends itself to mathematical formulation along the lines of Herbert Simon's "Behavioral Theory of Rationality," *Models of Man* (New York, 1957). But this does not solve the most difficult problem of "measurement and estimation."

government.[26] Governments select the action that will maximize strategic goals and objectives. These "solutions" to strategic problems are the fundamental categories in terms of which the analyst perceives what is to be explained.

II. Organizing Concepts

A. *National Actor.* The nation or government, conceived as a rational, unitary decision-maker, is the agent. This actor has one set of specified goals (the equivalent of a consistent utility function), one set of perceived options, and a single estimate of the consequences that follow from each alternative.

B. *The Problem.* Action is chosen in response to the strategic problem which the nation faces. Threats and opportunities arising in the "international strategic market place" move the nation to act.

C. *Static Selection.* The sum of activity of representatives of the government relevant to a problem constitutes what the nation has chosen as its "solution." Thus the action is conceived as a steady-state choice among alternative outcomes (rather than, for example, a large number of partial choices in a dynamic stream).

D. *Action as Rational Choice.* The components include:

1. *Goals and Objectives.* National security and national interests are the principal categories in which strategic goals are conceived. Nations seek security and a range of further objectives. (Analysts rarely translate strategic goals and objectives into an explicit utility function; nevertheless, analysts do focus on major goals and objectives and trade off side effects in an intuitive fashion.)

2. *Options.* Various courses of action relevant to a strategic problem provide the spectrum of options.

3. *Consequences.* Enactment of each alternative course of action will produce a series of consequences. The relevant consequences constitute benefits and costs in terms of strategic goals and objectives.

4. *Choice.* Rational choice is value-maximizing. The rational agent selects the alternative whose consequences rank highest in terms of his goals and objectives.

III. Dominant Inference Pattern

This paradigm leads analysts to rely on the following pattern of inference: if a nation performed a particular action, that nation must have had ends towards which the action constituted an optimal means. The rational policy model's explanatory power stems from this inference pattern. Puzzlement is relieved by revealing the purposive pattern within which the occurrence can be located as a value-maximizing means.

IV. General Propositions

The disgrace of political science is the infrequency with which propositions of any generality are formulated and tested. "Paradigmatic analysis" argues for explicitness about the terms in which analysis proceeds, and seriousness about the logic of explanation. Simply to illustrate the kind of propositions on which analysts who employ this model rely, the formulation includes several.

The basic assumption of value-maximizing behavior produces propositions central to most explanations. The general principle can be formulated as follows: the likelihood of any particular action results from a combination of the nation's (1) relevant values and objectives, (2) perceived alternative courses of action, (3) estimates of various sets of consequences (which will follow from each alternative), and (4) net valuation of each set of consequences. This yields two propositions.

A. An increase in the cost of an alternative, i.e., a reduction in the value of the set of consequences which will follow from that action, or a reduction in the probability of attaining fixed consequences, reduces the likelihood of that alternative being chosen.

B. A decrease in the costs of an alternative, i.e., an increase in the value of the set of consequences which will follow from that alternative, or an increase in the probability of attaining fixed consequences, increases the likelihood of that action being chosen.[27]

[26] Though a variant of this model could easily be stochastic, this paradigm is stated in non-probabilistic terms. In contemporary strategy, a stochastic version of this model is sometimes used for predictions; but it is almost impossible to find an explanation of an occurrence in foreign affairs that is consistently probabilistic.

Analogies between Model I and the concept of explanation developed by R. G. Collingwood, William Dray, and other "revisionists" among philosophers concerned with the critical philosophy of history are not accidental. For a summary of the "revisionist position" see Maurice Mandelbaum, "Historical Explanation: The Problem of Covering Laws," *History and Theory* (1960).

[27] This model is an analogue of the theory of the rational entrepreneur which has been developed extensively in economic theories of the firm and the consumer. These two propositions specify the "substitution effect." Refinement of this model and

V. Specific Propositions

A. *Deterrence.* The likelihood of any particular attack results from the factors specified in the general proposition. Combined with factual assertions, this general proposition yields the propositions of the sub-theory of deterrence.

(1) A stable nuclear balance reduces the likelihood of nuclear attack. This proposition is derived from the general proposition plus the asserted fact that a second-strike capability affects the potential attacker's calculations by increasing the likelihood and the costs of one particular set of consequences which might follow from attack—namely, retaliation.

(2) A stable nuclear balance increases the probability of limited war. This proposition is derived from the general proposition plus the asserted fact that though increasing the costs of a nuclear exchange, a stable nuclear balance nevertheless produces a more significant reduction in the probability that such consequences would be chosen in response to a limited war. Thus this set of consequences weighs less heavily in the calculus.

B. *Soviet Force Posture.* The Soviet Union chooses its force posture (i.e., its weapons and their deployment) as a value-maximizing means of implementing Soviet strategic objectives and military doctrine. A proposition of this sort underlies Secretary of Defense Laird's inference from the fact of 200 SS-9s (large intercontinental missiles) to the assertion that, "the Soviets are going for a first-strike capability, and there's no question about it."[28]

VARIANTS OF THE RATIONAL POLICY MODEL

This paradigm exhibits the characteristics of the most refined version of the rational model. The modern literature of strategy employs a model of this sort. Problems and pressures in the "international strategic marketplace" yield probabilities of occurrence. The international actor, which could be any national actor, is simply a value-maximizing mechanism for getting from the strategic problem to the logical solution. But the explanations and predictions produced by most analysts of foreign affairs depend primarily on variants of this "pure" model. The point of each is the same: to place the action within a value-maximizing framework, given certain constraints. Nevertheless, it may be helpful to identify several variants, each of which might be exhibited similarly as a paradigm. The first focuses upon the national actor and his choice in a particular situation, leading analysts to further constrain the goals, alternatives, and consequences considered. Thus, (1) national propensities or personality traits reflected in an "operational code," (2) concern with certain objectives, or (3) special principles of action, narrow the "goals" or "alternatives" or "consequences" of the paradigm. For example, the Soviet deployment of ABMs is sometimes explained by reference to the Soviet's "defense-mindedness." Or a particular Soviet action is explained as an instance of a special rule of action in the Bolshevik operational code.[29] A second, related, cluster of variants focuses on the individual leader or leadership group as the actor whose preference function is maximized and whose personal (or group) characteristics are allowed to modify the alternatives, consequences, and rules of choice. Explanations of the U.S. involvement in Vietnam as a natural consequence of the Kennedy-Johnson Administration's axioms of foreign policy rely on this variant. A third, more complex variant of the basic model recognizes the existence of several actors within a government, for example, Hawks and Doves or military and civilians, but attempts to explain (or predict) an occurrence by reference to the objectives of the victorious actor. Thus, for example, some revisionist histories of the Cold War recognize the forces of light and the forces of darkness within the U.S. government, but explain American actions as a result of goals and perceptions of the victorious forces of darkness.

Each of these forms of the basic paradigm constitutes a formalization of what analysts typically rely upon implicitly. In the transition from implicit conceptual model to explicit paradigm much of the richness of the best employments of this model has been lost. But the purpose in raising loose, implicit conceptual models to an explicit level is to reveal the basic logic of analysts' activity. Perhaps some of the remaining artificiality that surrounds the statement of the paradigm can be erased by noting a number of the standard additions and modifications employed by analysts who proceed *predominantly* within the rational policy model. First, in the course of a document, analysts shift from one variant of the basic model to another, occasionally appropriating in an *ad hoc* fashion aspects of a situation which are logically incompatible with the basic model. Second, in the course of explaining a number of occurrences, analysts sometimes pause over a particular event about which they have a great deal of information and unfold it in such detail that an impression of

specification of additional general propositions by translating from the economic theory is straightforward.

[28] *New York Times,* March 22, 1969.

[29] See Nathan Leites, *A Study of Bolshevism* (Glencoe, Illinois, 1953).

randomness is created. Third, having employed other assumptions and categories in deriving an explanation or prediction, analysts will present their product in a neat, convincing rational policy model package. (This accommodation is a favorite of members of the intelligence community whose association with the details of a process is considerable, but who feel that by putting an occurrence in a larger rational framework, it will be more comprehensible to their audience.) Fourth, in attempting to offer an explanation—particularly in cases where a prediction derived from the basic model has failed—the notion of a "mistake" is invoked. Thus, the failure in the prediction of a "missile gap" is written off as a Soviet mistake in not taking advantage of their opportunity. Both these and other modifications permit Model I analysts considerably more variety than the paradigm might suggest. But such accommodations are essentially appendages to the basic logic of these analyses.

THE U.S. BLOCKADE OF CUBA: A FIRST CUT[30]

The U.S. response to the Soviet Union's emplacement of missiles in Cuba must be understood in strategic terms as simple value-maximizing escalation. American nuclear superiority could be counted on to paralyze Soviet nuclear power; Soviet transgression of the nuclear threshold in response to an American use of lower levels of violence would be wildly irrational since it would mean virtual destruction of the Soviet Communist system and Russian nation. American local superiority was overwhelming: it could be initiated at a low level while threatening with high credibility an ascending sequence of steps short of the nuclear threshold. All that was required was for the United States to bring to bear its strategic and local superiority in such a way that American determination to see the missiles removed would be demonstrated, while at the same time allowing Moscow time and room to retreat without humiliation. The naval blackade—euphemistically named a "quarantine" in order to circumvent the niceties of international law—did just that.

The U.S. government's selection of the blockade followed this logic. Apprised of the presence of Soviet missiles in Cuba, the President assembled an Executive Committee (ExCom) of the National Security Council and directed them to "set aside all other tasks to make a prompt and intense survey of the dangers and all possible courses of action."[31] This group functioned as "fifteen individuals on our own, representing the President and not different departments."[32] As one of the participants recalls, "The remarkable aspect of those meetings was a sense of complete equality."[33] Most of the time during the week that followed was spent canvassing all the possible tracks and weighing the arguments for and against each. Six major categories of action were considered.

1. Do nothing. U.S. vulnerability to Soviet missiles was no new thing. Since the U.S. already lived under the gun of missiles based in Russia, a Soviet capability to strike from Cuba too made little real difference. The real danger stemmed from the possibility of U.S. over-reaction. The U.S. should announce the Soviet action in a calm, casual manner thereby deflating whatever political capital Khrushchev hoped to make of the missiles.

This argument fails on two counts. First, it grossly underestimates the military importance of the Soviet move. Not only would the Soviet Union's missile capability be doubled and the U.S. early warning system outflanked. The Soviet Union would have an opportunity to reverse the strategic balance by further installations, and indeed, in the longer run, to invest in cheaper, shorter-range rather than more expensive longer-range missiles. Second, the political importance of this move was undeniable. The Soviet Union's act challenged the American President's most solemn warning. If the U.S. failed to respond, no American commitment would be credible.

2. Diplomatic pressures. Several forms were considered: an appeal to the U.N. or O.A.S. for an inspection team, a secret approach to Khrushchev, and a direct approach to Khrushchev, perhaps at a summit meeting. The United States would demand that the missiles be removed, but the final settlement might include neutralization of Cuba, U.S. withdrawal from the Guantanamo base, and withdrawal of U.S. Jupiter missiles from Turkey or Italy.

Each form of the diplomatic approach had its own drawbacks. To arraign the Soviet Union before the U.N. Security Council held little promise since the Russians could veto any proposed action. While the diplomats argued, the missiles would become operational. To send a secret emissary to Khrushchev demanding that

[30] As stated in the introduction, this "case snapshot" presents, without editorial commentary, a Model I analyst's explanation of the U.S. blockade. The purpose is to illustrate a strong, characteristic rational policy model account. This account is (roughly) consistent with prevailing explanations of these events.

[31] Theodore Sorensen, *op. cit.*, p. 675.

[32] *Ibid.*, p. 679.

[33] *Ibid.*, p. 679.

the missiles be withdrawn would be to pose untenable alternatives. On the one hand, this would invite Khrushchev to seize the diplomatic initiative, perhaps committing himself to strategic retaliation in response to an attack on Cuba. On the other hand, this would tender an ultimatum that no great power could accept. To confront Khrushchev at a summit would guarantee demands for U.S. concessions, and the analogy between U.S. missiles in Turkey and Russian missiles in Cuba could not be erased.

But why not trade U.S. Jupiters in Turkey and Italy, which the President had previously ordered withdrawn, for the missiles in Cuba? The U.S. had chosen to withdraw these missiles in order to replace them with superior, less vulnerable Mediterranean Polaris submarines. But the middle of the crisis was no time for concessions. The offer of such a deal might suggest to the Soviets that the West would yield and thus tempt them to demand more. It would certainly confirm European suspicions about American willingness to sacrifice European interests when the chips were down. Finally, the basic issue should be kept clear. As the President stated in reply to Bertrand Russell, "I think your attention might well be directed to the burglars rather than to those who have caught the burglars."[34]

3. A secret approach to Castro. The crisis provided an opportunity to separate Cuba and Soviet Communism by offering Castro the alternatives, "split or fall." But Soviet troops transported, constructed, guarded, and controlled the missiles. Their removal would thus depend on a Soviet decision.

4. Invasion. The United States could take this occasion not only to remove the missiles but also to rid itself of Castro. A Navy exercise had long been scheduled in which Marines, ferried from Florida in naval vessels, would liberate the imaginary island of Vieques.[35] Why not simply shift the point of disembarkment? (The Pentagon's foresight in planning this operation would be an appropriate antidote to the CIA's Bay of Pigs!)

Preparations were made for an invasion, but as a last resort. American troops would be forced to confront 20,000 Soviets in the first Cold War case of direct contact between the troops of the super powers. Such brinksmanship courted nuclear disaster, practically guaranteeing an equivalent Soviet move against Berlin.

5. Surgical air strike. The missile sites should be removed by a clean, swift conventional attack. This was the effective counter-action which the attempted deception deserved. A surgical strike would remove the missiles and thus eliminate both the danger that the missiles might become operational and the fear that the Soviets would discover the American discovery and act first.

The initial attractiveness of this alternative was dulled by several difficulties. First, could the strike really be "surgical"? The Air Force could not guarantee destruction of all the missiles.[36] Some might be fired during the attack; some might not have been identified. In order to assure destruction of Soviet and Cuban means of retaliating, what was required was not a surgical but rather a massive attack—of at least 500 sorties. Second, a surprise air attack would of course kill Russians at the missile sites. Pressures on the Soviet Union to retaliate would be so strong that an attack on Berlin or Turkey was highly probable. Third, the key problem with this program was that of advance warning. Could the President of the United States, with his memory of Pearl Harbor and his vision of future U.S. responsibility, order a "Pearl Harbor in reverse"? For 175 years, unannounced Sunday morning attacks had been an anathema to our tradition.[37]

6. Blockade. Indirect military action in the form of a blockade became more attractive as the ExCom dissected the other alternatives. An embargo on military shipments to Cuba enforced by a naval blockade was not without flaws, however. Could the U.S. blockade Cuba without inviting Soviet reprisal in Berlin? The likely solution to joint blockades would be the lifting of both blockades, restoring the new *status quo,* and allowing the Soviets additional time to complete the missiles. Second, the possible consequences of the blockade resembled the drawbacks which disqualified the air strike. If Soviet ships did not stop, the United States would be forced to fire the first shot, inviting retaliation. Third, a blockade would deny the traditional freedom of the seas demanded by several of our close allies and might be held illegal, in violation of the U.N. Charter and international law, unless the United States could obtain a two-thirds vote in the O.A.S. Finally, how

[34] Elie Abel, *The Missile Crisis* (New York, 1966), p. 144.

[35] *Ibid.,* p. 102.

[36] Sorensen, *op. cit.,* p. 684.

[37] *Ibid.,* p. 685. Though this was the formulation of the argument, the facts are not strictly accurate. Our tradition against surprise attack was rather younger than 175 years. For example President Theodore Roosevelt applauded Japan's attack on Russia in 1904.

could a blockade be related to the problem, namely, some 75 missiles on the island of Cuba, approaching operational readiness daily? A blockade offered the Soviets a spectrum of delaying tactics with which to buy time to complete the missile installations. Was a *fait accompli* not required?

In spite of these enormous difficulties the blockade had comparative advantages: (1) It was a middle course between inaction and attack, aggressive enough to communicate firmness of intention, but nevertheless not so precipitous as a strike. (2) It placed on Khrushchev the burden of choice concerning the next step. He could avoid a direct military clash by keeping his ships away. His was the last clear chance. (3) No possible military confrontation could be more acceptable to the U.S. than a naval engagement in the Caribbean. (4) This move permitted the U.S., by flexing its conventional muscle, to exploit the threat of subsequent non-nuclear steps in each of which the U.S. would have significant superiority.

Particular arguments about advantages and disadvantages were powerful. The explanation of the American choice of the blockade lies in a more general principle, however. As President Kennedy stated in drawing the moral of the crisis:

> Above all, while defending our own vital interests, nuclear powers must avert those confrontations which bring an adversary to a choice of either a humiliating retreat or a nuclear war. To adopt that kind of course in the nuclear age would be evidence only of the bankruptcy of our policy—of a collective death wish for the world.[38]

The blockade was the United States' only real option.

MODEL II: ORGANIZATIONAL PROCESS

For some purposes, governmental behavior can be usefully summarized as action chosen by a unitary, rational decisionmaker: centrally controlled, completely informed, and value maximizing. But this simplification must not be allowed to conceal the fact that a "government" consists of a conglomerate of semi-feudal, loosely allied organizations, each with a substantial life of its own. Government leaders do sit formally, and to some extent in fact, on top of this conglomerate. But governments perceive problems through organizational sensors. Governments define alternatives and estimate consequences as organizations process information. Governments act as these organizations enact routines. Government behavior can therefore be understood according to a second conceptual model, less as deliberate choices of leaders and more as *outputs* of large organizations functioning according to standard patterns of behavior.

To be responsive to a broad spectrum of problems, governments consist of large organizations among which primary responsibility for particular areas is divided. Each organization attends to a special set of problems and acts in quasi-independence on these problems. But few important problems fall exclusively within the domain of a single organization. Thus government behavior relevant to any important problem reflects the independent output of several organizations, partially coordinated by government leaders. Government leaders can substantially disturb, but not substantially control, the behavior of these organizations.

To perform complex routines, the behavior of large numbers of individuals must be coordinated. Coordination requires standard operating procedures: rules according to which things are done. Assured capability for reliable performance of action that depends upon the behavior of hundreds of persons requires established "programs." Indeed, if the eleven members of a football team are to perform adequately on any particular down, each player must not "do what he thinks needs to be done" or "do what the quarterback tells him to do." Rather, each player must perform the maneuvers specified by a previously established play which the quarterback has simply called in this situation.

At any given time, a government consists of *existing* organizations, each with a *fixed* set of standard operating procedures and programs. The behavior of these organizations—and consequently of the government—relevant to an issue in any particular instance is, therefore, determined primarily by routines established in these organizations prior to that instance. But organizations do change. Learning occurs gradually, over time. Dramatic organizational change occurs in response to major crises. Both learning and change are influenced by existing organizational capabilities.

Borrowed from studies of organizations, these loosely formulated propositions amount simply to *tendencies*. Each must be hedged by modifiers like "other things being equal" and "under certain conditions." In particular instances, tendencies hold—more or less. In specific situations, the relevant question is: more or less? But this is as it should be. For, on the one hand, "organizations" are no more homogeneous a class than "solids." When scientists tried to generalize about "solids," they achieved similar results. Solids tend to expand when heated, but some do and some don't. More adequate categorization

[38] *New York Times*, June, 1963.

of the various elements now lumped under the rubric "organizations" is thus required. On the other hand, the behavior of particular organizations seems considerably more complex than the behavior of solids. Additional information about a particular organization is required for further specification of the tendency statements. In spite of these two caveats, the characterization of government action as organizational output differs distinctly from Model I. Attempts to understand problems of foreign affairs in terms of this frame of reference should produce quite different explanations.[39]

ORGANIZATIONAL PROCESS PARADIGM[40]

I. Basic Unit of Analysis: Policy as Organizational Output

The happenings of international politics are, in three critical senses, outputs of organizational processes. First, the actual occurrences are organizational outputs. For example, Chinese entry into the Korean War—that is, the fact that Chinese soldiers were firing at U.N. soldiers south of the Yalu in 1950—is an organizational action: the action of men who are soldiers in platoons which are in companies, which in turn are in armies, responding as privates to lieutenants who are responsible to captains and so on to the commander, moving into Korea, advancing against enemy troops, and firing according to fixed routines of the Chinese Army. Government leaders' decisions trigger organizational routines. Government leaders can trim the edges of this output and exercise some choice in combining outputs. But the mass of behavior is determined by previously established procedures. Second, existing organizational routines for employing present physical capabilities constitute the effective options open to government leaders confronted with any problem. Only the existence of men, equipped and trained as armies and capable of being transported to North Korea, made entry into the Korean War a live option for the Chinese leaders. The fact that fixed programs (equipment, men, and routines which exist at the particular time) exhaust the range of buttons that leaders can push is not always perceived by these leaders. But in every case it is critical for an understanding of what is actually done. Third, organizational outputs structure the situation within the narrow constraints of which leaders must contribute their "decision" concerning an issue. Outputs raise the problem, provide the information, and make the initial moves that color the face of the issue that is turned to the leaders. As Theodore Sorensen has observed: "Presidents rarely, if ever, make decisions—particularly in foreign affairs—in the sense of writing their conclusions on a clean slate . . . The basic decisions, which confine their choices, have all too often been previously made."[41] If one understands the structure of the situation and the face of the issue—which are determined by the organizational outputs—the formal choice of the leaders is frequently anti-climactic.

II. Organizing Concepts

A. *Organizational Actors.* The actor is not a monolithic "nation" or "government" but rather a constellation of loosely allied organizations on top of which government leaders sit. This constellation acts only as component organizations perform routines.[42]

B. *Factored Problems and Fractionated Power.* Surveillance of the multiple facets of for-

[39] The influence of organizational studies upon the present literature of foreign affairs is minimal. Specialists in international politics are not students of organization theory. Organization theory has only recently begun to study organizations as decisionmakers and has not yet produced behavioral studies of national security organizations from a decision-making perspective. It seems unlikely, however, that these gaps will remain unfilled much longer. Considerable progress has been made in the study of the business firm as an organization. Scholars have begun applying these insights to government organizations, and interest in an organizational perspective is spreading among institutions and individuals concerned with actual government operations. The "decisionmaking" approach represented by Richard Snyder, R. Bruck, and B. Sapin, *Foreign Policy Decision-Making* (Glencoe, Illinois, 1962), incorporates a number of insights from organization theory.

[40] The formulation of this paradigm is indebted both to the orientation and insights of Herbert Simon and to the behavioral model of the firm stated by Richard Cyert and James March, *A Behavioral Theory of the Firm* (Englewood Cliffs, 1963). Here, however, one is forced to grapple with the less routine, less quantified functions of the less differentiated elements in government organizations.

[41] Theodore Sorensen, "You Get to Walk to Work," *New York Times Magazine,* March 19, 1967.

[42] Organizations are not monolithic. The proper level of disaggregation depends upon the objectives of a piece of analysis. This paradigm is formulated with reference to the major organizations that constitute the U.S. government. Generalization to the major components of each department and agency should be relatively straightforward.

eign affairs requires that problems be cut up and parcelled out to various organizations. To avoid paralysis, primary power must accompany primary responsibility. But if organizations are permitted to do anything, a large part of what they do will be determined within the organization. Thus each organization perceives problems, processes information, and performs a range of actions in quasi-independence (within broad guidelines of national policy). Factored problems and fractionated power are two edges of the same sword. Factoring permits more specialized attention to particular facets of problems than would be possible if government leaders tried to cope with these problems by themselves. But this additional attention must be paid for in the coin of discretion for *what* an organization attends to, and *how* organizational responses are programmed.

C. *Parochial Priorities, Perceptions, and Issues.* Primary responsibility for a narrow set of problems encourages organizational parochialism. These tendencies are enhanced by a number of additional factors: (1) selective information available to the organization, (2) recruitment of personnel into the organization, (3) tenure of individuals in the organization, (4) small group pressures within the organization, and (5) distribution of rewards by the organization. Clients (e.g., interest groups), government allies (e.g., Congressional committees), and extra-national counterparts (e.g., the British Ministry of Defense for the Department of Defense, ISA, or the British Foreign Office for the Department of State, EUR) galvanize this parochialism. Thus organizations develop relatively stable propensities concerning operational priorities, perceptions, and issues.

D. *Action as Organizational Output.* The preeminent feature of organizational activity is its programmed character: the extent to which behavior in any particular case is an enactment of preestablished routines. In producing outputs, the activity of each organization is characterized by:

1. *Goals: Constraints Defining Acceptable Performance.* The operational goals of an organization are seldom revealed by formal mandates. Rather, each organization's operational goals emerge as a set of constraints defining acceptable performance. Central among these constraints is organizational health, defined usually in terms of bodies assigned and dollars appropriated. The set of constraints emerges from a mix of expectations and demands of other organizations in the government, statutory authority, demands from citizens and special interest groups, and bargaining within the organization. These constraints represent a quasi-resolution of conflict—the constraints are relatively stable, so there is some resolution. But conflict among alternative goals is always latent; hence, it is a quasi-resolution. Typically, the constraints are formulated as imperatives to avoid roughly specified discomforts and disasters.[43]

2. *Sequential Attention to Goals.* The existence of conflict among operational constraints is resolved by the device of sequential attention. As a problem arises, the subunits of the organization most concerned with that problem deal with it in terms of the constraints they take to be most important. When the next problem arises, another cluster of subunits deals with it, focusing on a different set of constraints.

3. *Standard Operating Procedures.* Organizations perform their "higher" functions, such as attending to problem areas, monitoring information, and preparing relevant responses for likely contingencies, by doing "lower" tasks, for example, preparing budgets, producing reports, and developing hardware. Reliable performance of these tasks requires standard operating procedures (hereafter SOPs). Since procedures are "standard" they do not change quickly or easily. Without these standard procedures, it would not be possible to perform certain concerted tasks. But because of standard procedures, organizational behavior in particular instances often appears unduly formalized, sluggish, or inappropriate.

4. *Programs and Repertoires.* Organizations must be capable of performing actions in which the behavior of large numbers of individuals is carefully coordinated. Assured performance requires clusters of rehearsed SOPs for producing specific actions, e.g., fighting enemy units or answering an embassy's cable. Each cluster comprises a "program" (in the terms both of drama and computers) which the organization has available for dealing with a situation. The list of programs relevant to a type of activity, e.g., fighting, constitutes an organizational repertoire. The number of programs in a repertoire is always quite limited. When properly triggered, organizations execute programs; programs cannot be substantially changed in a particular situation. The more complex the action and the greater the number of individuals involved, the more important are programs and repertoires as determinants of organizational behavior.

5. *Uncertainty Avoidance.* Organizations do not attempt to estimate the probability distribution of future occurrences. Rather, organizations

[43] The stability of these constraints is dependent on such factors as rules for promotion and reward, budgeting and accounting procedures, and mundane operating procedures.

avoid uncertainty. By arranging a *negotiated environment,* organizations regularize the reactions of other actors with whom they have to deal. The primary environment, relations with other organizations that comprise the government, is stabilized by such arrangements as agreed budgetary splits, accepted areas of responsibility, and established conventional practices. The secondary environment, relations with the international world, is stabilized between allies by the establishment of contracts (alliances) and "club relations" (U.S. State and U.K. Foreign Office or U.S. Treasury and U.K. Treasury). Between enemies, contracts and accepted conventional practices perform a similar function, for example, the rules of the "precarious status quo" which President Kennedy referred to in the missile crisis. Where the international environment cannot be negotiated, organizations deal with remaining uncertainties by establishing a set of *standard scenarios* that constitute the contingencies for which they prepare. For example, the standard scenario for Tactical Air Command of the U.S. Air Force involves combat with enemy aircraft. Planes are designed and pilots trained to meet this problem. That these preparations are less relevant to more probable contingencies, e.g., provision of close-in ground support in limited wars like Vietnam, has had little impact on the scenario.

6. *Problem-directed Search.* Where situations cannot be construed as standard, organizations engage in search. The style of search and the solution are largely determined by existing routines. Organizational search for alternative courses of action is problem-oriented: it focuses on the atypical discomfort that must be avoided. It is simple-minded: the neighborhood of the symptom is searched first; then, the neighborhood of the current alternative. Patterns of search reveal biases which in turn reflect such factors as specialized training or experience and patterns of communication.

7. *Organizational Learning and Change.* The parameters of organizational behavior mostly persist. In response to non-standard problems, organizations search and routines evolve, assimilating new situations. Thus learning and change follow in large part from existing procedures. But marked changes in organizations do sometimes occur. Conditions in which dramatic changes are more likely include: (1) Periods of budgetary feast. Typically, organizations devour budgetary feasts by purchasing additional items on the existing shopping list. Nevertheles[illegible] if committed to change, leaders who contro[illegible] udget can use extra funds to effect [illegible]ng[illegible] Periods of prolonged budgetary [illegible]in[illegible] a single year's famine typically results in few changes in organizational structure but a loss of effectiveness in performing some programs, prolonged famine forces major retrenchment. (3) Dramatic performance failures. Dramatic change occurs (mostly) in response to major disasters. Confronted with an undeniable failure of procedures and repertoires, authorities outside the organization demand change, existing personnel are less resistant to change, and critical members of the organization are replaced by individuals committed to change.

E. *Central Coordination and Control.* Action requires decentralization of responsibility and power. But problems lap over the jurisdictions of several organizations. Thus the necessity for decentralization runs headlong into the requirement for coordination. (Advocates of one horn or the other of this dilemma—responsive action entails decentralized power vs. coordinated action requires central control—account for a considerable part of the persistent demand for government reorganization.) Both the necessity for coordination and the centrality of foreign policy to national welfare guarantee the involvement of government leaders in the procedures of the organizations among which problems are divided and power shared. Each organization's propensities and routines can be disturbed by government leaders' intervention. Central direction and persistent control of organizational activity, however, is not possible. The relation among organizations, and between organizations and the government leaders depends critically on a number of structural variables including: (1) the nature of the job, (2) the measures and information available to government leaders, (3) the system of rewards and punishments for organizational members, and (4) the procedures by which human and material resources get committed. For example, to the extent that rewards and punishments for the members of an organization are distributed by higher authorities, these authorities can exercise some control by specifying criteria in terms of which organizational output is to be evaluated. These criteria become constraints within which organizational activity proceeds. But constraint is a crude instrument of control.

Intervention by government leaders does sometimes change the activity of an organization in an intended direction. But instances are fewer than might be expected. As Franklin Roosevelt, the master manipulator of government organizations, remarked:

> The Treasury is so large and far-flung and ingrained in its practices that I find it is almost impossible to get the action and results I want. . . .

But the Treasury is not to be compared with the State Department. You should go through the experience of trying to get any changes in the thinking, policy, and action of the career diplomats and then you'd know what a real problem was. But the Treasury and the State Department put together are nothing compared with the Na-a-vy . . . To change anything in the Na-a-vy is like punching a feather bed. You punch it with your right and you punch it with your left until you are finally exhausted, and then you find the damn bed just as it was before you started punching.[44]

John Kennedy's experience seems to have been similar: "The State Department," he asserted, "is a bowl full of jelly."[45] And lest the McNamara revolution in the Defense Department seem too striking a counter-example, the Navy's recent rejection of McNamara's major intervention in Naval weapons procurement, the F-111B, should be studied as an antidote.

F. *Decisions of Government Leaders.* Organizational persistence does not exclude shifts in governmental behavior. For government leaders sit atop the conglomerate of organizations. Many important issues of governmental action require that these leaders decide what organizations will play out which programs where. Thus stability in the parochialisms and SOPs of individual organizations is consistent with some important shifts in the behavior of governments. The range of these shifts is defined by existing organizational programs.

III. Dominant Inference Pattern

If a nation performs an action of this type today, its organizational components must yesterday have been performing (or have had established routines for performing) an action only marginally different from this action. At any specific point in time, a government consists of an established conglomerate of organizations, each with existing goals, programs, and repertoires. The characteristics of a government's action in any instance follows from those established routines, and from the choice of government leaders —on the basis of information and estimates provided by existing routines—among existing programs. The best explanation of an organization's behavior at t is $t-1$; the prediction of $t+1$ is t. Model II's explanatory power is achieved by uncovering the organizational routines and repertoires that produced the outputs that comprise the puzzling occurrence.

[44] Marriner Eccles, *Beckoning Frontiers* (New York, 1951), p. 336.

[45] Arthur Schlesinger, *A Thousand Days* (Boston, 1965), p. 406.

IV. General Propositions

A number of general propositions have been stated above. In order to illustrate clearly the type of proposition employed by Model II analysts, this section formulates several more precisely.

A. *Organizational Action.* Activity according to SOPs and programs does not constitute far-sighted, flexible adaptation to "the issue" (as it is conceived by the analyst). Detail and nuance of actions by organizations are determined predominantly by organizational routines, not government leaders' directions.

1. SOPs constitute routines for dealing with *standard* situations. Routines allow large numbers of ordinary individuals to deal with numerous instances, day after day, without considerable thought, by responding to basic stimuli. But this regularized capability for adequate performance is purchased at the price of standardization. If the SOPs are appropriate, average performance, i.e., performance averaged over the range of cases, is better than it would be if each instance were approached individually (given fixed talent, timing, and resource constraints). But specific instances, particularly critical instances that typically do not have "standard" characteristics, are often handled sluggishly or inappropriately.

2. A program, i.e., a complex action chosen from a short list of programs in a repertoire, is rarely tailored to the specific situation in which it is executed. Rather, the program is (at best) the most appropriate of the programs in a previously developed repertoire.

3. Since repertoires are developed by parochial organizations for standard scenarios defined by that organization, programs available for dealing with a particular situation are often ill-suited.

B. *Limited Flexibility and Incremental Change.* Major lines of organizational action are straight, i.e., behavior at one time is marginally different from that behavior at $t-1$. Simple-minded predictions work best: Behavior at $t+1$ will be marginally different from behavior at the present time.

1. Organizational budgets change incrementally—both with respect to totals and with respect to intra-organizational splits. Though organizations could divide the money available each year by carving up the pie anew (in the light of changes in objectives or environment), in practice, organizations take last year's budget as a base and adjust incrementally. Predictions that require large budgetary shifts in a single year between organizations or between units within an organization should be hedged.

2. Once undertaken, an organizational in-

vestment is not dropped at the point where "objective" costs outweigh benefits. Organizational stakes in adopted projects carry them quite beyond the loss point.

C. *Administrative Feasibility.* Adequate explanation, analysis, and prediction must include administrative feasibility as a major dimension. A considerable gap separates what leaders choose (or might rationally have chosen) and what organizations implement.

1. Organizations are blunt instruments. Projects that require several organizations to act with high degrees of precision and coordination are not likely to succeed.

2. Projects that demand that existing organizational units depart from their accustomed functions and perform previously unprogrammed tasks are rarely accomplished in their designed form.

3. Government leaders can expect that each organization will do its "part" in terms of what the organization knows how to do.

4. Government leaders can expect incomplete and distorted information from each organization concerning its part of the problem.

5. Where an assigned piece of a problem is contrary to the existing goals of an organization, resistance to implementation of that piece will be encountered.

V. *Specific Propositions.*

1. *Deterrence.* The probability of nuclear attack is less sensitive to balance and imbalance, or stability and instability (as these concepts are employed by Model I strategists) than it is to a number of organizational factors. Except for the special case in which the Soviet Union acquires a credible capability to destroy the U.S. with a disarming blow, U.S. superiority or inferiority affects the probability of a nuclear attack less than do a number of organizational factors.

First, if a nuclear attack occurs, it will result from organizational activity: the firing of rockets by members of a missile group. The enemy's *control system,* i.e., physical mechanisms and standard procedures which determine who can launch rockets when, is critical. Second, the enemy's programs for bringing his strategic forces to *alert status* determine probabilities of accidental firing and momentum. At the outbreak of World War I, if the Russian Tsar had understood the organizational processes which his order of full mobilization triggered, he would have realized that he had chosen war. Third, organizational repertoires fix the range of effective choice open to enemy leaders. The menu available to Tsar Nicholas in 1914 has two entrees: full mobilization and no mobilization. Partial mobilization was not an organizational option. Fourth, since organizational routines set the chessboard, the training and deployment of troops and nuclear weapons is crucial. Given that the outbreak of hostilities in Berlin is more probable than most scenarios for nuclear war, facts about deployment, training, and tactical nuclear equipment of Soviet troops stationed in East Germany—which will influence the face of the issue seen by Soviet leaders at the outbreak of hostilities and the manner in which choice is implemented—are as critical as the question of "balance."

2. *Soviet Force Posture.* Soviet force posture, i.e., the fact that certain weapons rather than others are procured and deployed, is determined by organizational factors such as the goals and procedures of existing military services and the goals and processes of research and design labs, within budgetary constraints that emerge from the government leader's choices. The frailty of the Soviet Air Force within the Soviet military establishment seems to have been a crucial element in the Soviet failure to acquire a large bomber force in the 1950s (thereby faulting American intelligence predictions of a "bomber gap"). The fact that missiles were controlled until 1960 in the Soviet Union by the Soviet Ground Forces, whose goals and procedures reflected no interest in an intercontinental mission, was not irrelevant to the slow Soviet buildup of ICBMs (thereby faulting U.S. intelligence predictions of a "missile gap"). These organizational factors (Soviet Ground Forces' control of missiles and that service's fixation with European scenarios) make the Soviet deployment of so many MRBMs that European targets could be destroyed three times over, more understandable. Recent weapon developments, e.g., the testing of a Fractional Orbital Bombardment System (FOBS) and multiple warheads for the SS-9, very likely reflect the activity and interests of a cluster of Soviet research and development organizations, rather than a decision by Soviet leaders to acquire a first strike weapon system. Careful attention to the organizational components of the Soviet military establishment (Strategic Rocket Forces, Navy, Air Force, Ground Forces, and National Air Defense), the missions and weapons systems to which each component is wedded (an independent weapon system assists survival as an independent service), and existing budgetary splits (which probably are relatively stable in the Soviet Union as they tend to be everywhere) offer potential improvements in medium and longer term predictions.

THE U.S. BLOCKADE OF CUBA: A SECOND CUT

Organizational Intelligence. At 7:00 P.M. on

October 22, 1962, President Kennedy disclosed the American discovery of the presence of Soviet strategic missiles in Cuba, declared a "strict quarantine on all offensive military equipment under shipment to Cuba," and demanded that "Chairman Khrushchev halt and eliminate this clandestine, reckless, and provocative threat to world peace."[46] This decision was reached at the pinnacle of the U.S. Government after a critical week of deliberation. What initiated that precious week were photographs of Soviet missile sites in Cuba taken on October 14. These pictures might not have been taken until a week later. In that case, the President speculated, "I don't think probably we would have chosen as prudently as we finally did."[47] U.S. leaders might have received this information three weeks earlier—if a U-2 had flown over San Cristobal in the last week of September.[48] What determined the context in which American leaders came to choose the blockade was the discovery of missiles on October 14.

There has been considerable debate over alleged American "intelligence failures" in the Cuban missile crisis.[49] But what both critics and defenders have neglected is the fact that the discovery took place on October 14, rather than three weeks earlier or a week later, as a consequence of the established routines and procedures of the organizations which constitute the U.S. intelligence community. These organizations were neither more nor less successful than they had been the previous month or were to be in the months to follow.[50]

The notorious "September estimate," approved by the United States Intelligence Board (USIB) on September 19, concluded that the Soviet Union would not introduce offensive missiles into Cuba.[51] No U-2 flight was directed over the western end of Cuba (after September 5) before October 4.[52] No U-2 flew over the western end of Cuba until the flight that discovered the Soviet missiles on October 14.[53] Can these "failures" be accounted for in organizational terms?

On September 19 when USIB met to consider the question of Cuba, the "system" contained the following information: (1) shipping intelligence had noted the arrival in Cuba of two large-hatch Soviet lumber ships, which were riding high in the water; (2) refugee reports of countless sightings of missiles, but also a report that Castro's private pilot, after a night of drinking in Havana, had boasted: "We will fight to the death and perhaps we can win because we have everything, including atomic weapons"; (3) a sighting by a CIA agent of the rear profile of a strategic missile; (4) U-2 photos produced by flights of August 29, September 5 and 17 showing the construction of a number of SAM sites and other defensive missiles.[54] Not all of this information was on the desk of the estimators, however. Shipping intelligence experts noted the fact that large-hatch ships were riding high in the water and spelled out the inference: the ships must be carrying "space consuming" cargo.[55] These facts were carefully included in the catalogue of intelligence concerning shipping. For experts sensitive to the Soviets' shortage of ships, however, these facts carried no special signal. The refugee report of Castro's private pilot's remark had been received at Opa Locka, Florida, along with vast reams of inaccurate reports generated by the refugee community. This report and a thousand others had to be checked and compared before being sent to Washington. The two weeks required for initial processing could have been shortened by a large increase in resources, but the yield of this source was already quite marginal. The CIA agent's sighting of the rear profile of a strategic missile had oc-

[55] The facts here are not entirely clear. This assertion is based on information from (1) "Department of Defense Briefing by the Honorable R. S. McNamara, Secretary of Defense, State Department Auditorium, 5:00 p.m., February 6, 1963." A verbatim transcript of a presentation actually made by General Carroll's assistant, John Hughes; and (2) Hilsman's statement, *op. cit.*, p. 186. But see R. Wohlstetter's interpretation, "Cuba and Pearl Harbor," 700.

curred on September 12; transmission time from agent sighting to arrival in Washington typically took 9 to 12 days. Shortening this transmission time would impose severe cost in terms of danger to sub-agents, agents, and communication networks.

On the information available, the intelligence chiefs who predicted that the Soviet Union would not introduce offensive missiles into Cuba made a reasonable and defensible judgment.[56] Moreover, in the light of the fact that these organizations were gathering intelligence not only about Cuba but about potential occurrences in all parts of the world, the informational base available to the estimators involved nothing out of the ordinary. Nor, from an organizational perspective, is there anything startling about the gradual accumulation of evidence that led to the formulation of the hypothesis that the Soviets were installing missiles in Cuba and the decision on October 4 to direct a special flight over western Cuba.

The ten-day delay between that decision and the flight is another organizational story.[57] At the October 4 meeting, the Defense Department took the opportunity to raise an issue important to its concerns. Given the increased danger that a U-2 would be downed, it would be better if the pilot were an officer in uniform rather than a CIA agent. Thus the Air Force should assume responsibility for U-2 flights over Cuba. To the contrary, the CIA argued that this was an intelligence operation and thus within the CIA's jurisdiction. Moreover, CIA U-2's had been modified in certain ways which gave them advantages over Air Force U-2's in averting Soviet SAM's. Five days passed while the State Department pressed for less risky alternatives such as drones and the Air Force (in Department of Defense guise) and CIA engaged in territorial disputes. On October 9 a flight plan over San Cristobal was approved by COMOR, but to the CIA's dismay, Air Force pilots rather than CIA agents would take charge of the mission. At this point details become sketchy, but several members of the intelligence community have speculated that an Air Force pilot in an Air Force U-2 attempted a high altitude overflight on October 9 that "flamed out", i.e., lost power, and thus had to descend in order to restart its engine. A second round between Air Force and CIA followed, as a result of which Air Force pilots were trained to fly CIA U-2's. A successful overflight took place on October 14.

This ten-day delay constitutes some form of "failure." In the face of well-founded suspicions concerning offensive Soviet missiles in Cuba that posed a critical threat to the United States' most vital interest, squabbling between organizations whose job it is to produce this information seems entirely inappropriate. But for each of these organizations, the question involved the issue: "*Whose* job was it to be?" Moreover, the issue was not simply, which organization would control U-2 flights over Cuba, but rather the broader issue of ownership of U-2 intelligence activities—a very long standing territorial dispute. Thus though this delay was in one sense a "failure," it was also a nearly inevitable consequence of two facts: many jobs do not fall neatly into precisely defined organizational jurisdictions; and vigorous organizations are imperialistic.

Organizational Options. Deliberations of leaders in ExCom meetings produced broad outlines of alternatives. Details of these alternatives and blueprints for their implementation had to be specified by the organizations that would perform these tasks. These organizational outputs answered the question: What, specifically, *could* be done?

Discussion in the ExCom quickly narrowed the live options to two: an air strike and a blockade. The choice of the blockade instead of the air strike turned on two points: (1) the argument from morality and tradition that the United States could not perpetrate a "Pearl Harbor in reverse"; (2) the belief that a "surgical" air strike was impossible.[58] Whether the United States *might* strike first was a question not of capability but of morality. Whether the United States *could* perform the surgical strike was a factual question concerning capabilities. The majority of the members of the ExCom, including the President, initially preferred the air strike.[59] What effectively foreclosed this option, however, was the fact that the air strike they wanted could not be chosen with high confidence of success.[60] After having tentatively chosen the course of prudence—given that the surgical air strike was not an option—Kennedy reconsidered. On Sunday morning, October 21, he called the Air Force experts to a special meeting in his living quarters where he probed once more for the option of a "*surgical*" air strike.[61] General

[61] *Ibid.*, pp. 694–697.

Walter C. Sweeny, Commander of Tactical Air Forces, asserted again that the Air Force could guarantee no higher than ninety percent effectiveness in a surgical air strike.[62] That "fact" was false.

The air strike alternative provides a classic case of military estimates. One of the alternatives outlined by the ExCom was named "air strike." Specification of the details of this alternative was delegated to the Air Force. Starting from an existing plan for massive U.S. military action against Cuba (prepared for contingencies like a response to a Soviet Berlin grab), Air Force estimators produced an attack to guarantee success.[63] This plan called for extensive bombardment of all missile sites, storage depots, airports, and, in deference to the Navy, the artillery batteries opposite the naval base at Guantanamo.[64] Members of the ExCom repeatedly expressed bewilderment at military estimates of the number of sorties required, likely casualties, and collateral damage. But the "surgical" air strike that the political leaders had in mind was never carefully examined during the first week of the crisis. Rather, this option was simply excluded on the grounds that since the Soviet MRBM's in Cuba were classified "mobile" in U.S. manuals, extensive bombing was required. During the second week of the crisis, careful examination revealed that the missiles were mobile, in the sense that small houses are mobile: that is, they could be moved and reassembled in 6 days. After the missiles were reclassified "movable" and detailed plans for surgical air strikes specified, this action was added to the list of live options for the end of the second week.

Organizational Implementation. Ex-Com members separated several types of blockade: offensive weapons only, all armaments, and all strategic goods including POL (petroleum, oil, and lubricants). But the *"details"* of the operation were left to the Navy. Before the President announced the blockade on Monday evening, the first stage of the Navy's blueprint was in motion, and a problem loomed on the horizon.[65] The Navy had a detailed plan for the blockade. The President had several less precise but equally determined notions concerning what should be done, when, and how. For the Navy the issue was one of effective implementation of the Navy's blockade—without the meddling and interference of political leaders. For the President, the problem was to pace and manage events in such a way that the Soviet leaders would have time to see, think, and blink.

A careful reading of available sources uncovers an instructive incident. On Tuesday the British Ambassador, Ormsby-Gore, after having attended a briefing on the details of the blockade, suggested to the President that the plan for intercepting Soviet ships far out of reach of Cuban jets did not facilitate Khrushchev's hard decision.[66] Why not make the interception much closer to Cuba and thus give the Russian leader more time? According to the public account and the recollection of a number of individuals involved, Kennedy "agreed immediately, called McNamara, and over emotional Navy protest, issued the appropriate instructions."[67] As Sorensen records, "in a sharp clash with the Navy, he made certain his will prevailed."[68] The Navy's plan for the blockade was thus changed by drawing the blockade much closer to Cuba.

A serious organizational orientation makes one suspicious of this account. More careful examination of the available evidence confirms these suspicions, though alternative accounts must be somewhat speculative. According to the public chronology, a quarantine drawn close to Cuba became effective on Wednesday morning, the first Soviet ship was contacted on Thursday morning, and the first boarding of a ship occurred on Friday. According to the statement by the Department of Defense, boarding of the *Marcula* by a party from the *John R. Pierce* "took place at 7:50 A.M., E.D.T., 180 miles northeast of Nassau."[69] The *Marcula* had been trailed since about 10:30 the previous evening.[70] Simple calculations suggest that the *Pierce* must have been stationed along the Navy's original arc which extended 500 miles out to sea from Cape Magsi, Cuba's eastern most tip.[71] The blockade line was *not* moved as the President ordered, and the accounts report.

What happened is not entirely clear. One can be certain, however, that Soviet ships passed through the line along which American destroyers had posted themselves before the official "first contact" with the Soviet ship. On October 26 a Soviet tanker arrived in Havana and was honored by a dockside rally for "running the blockade." Photographs of this vessel show the name *Vinnitsa* on the side of the vessel in

Cyrillic letters.[72] But according to the official U.S. position, the first tanker to pass through the blockade was the *Bucharest*, which was hailed by the Navy on the morning of October 25. Again simple mathematical calculation excludes the possibility that the *Bucharest* and the *Vinnitsa* were the same ship. It seems probable that the Navy's resistance to the President's order that the blockade be drawn in closer to Cuba forced him to allow one or several Soviet ships to pass through the blockade after it was officially operative.[73]

This attempt to leash the Navy's blockade had a price. On Wednesday morning, October 24, what the President had been awaiting occurred. The 18 dry cargo ships heading towards the quarantine stopped dead in the water. This was the occasion of Dean Rusk's remark, "We are eyeball to eyeball and I think the other fellow just blinked."[74] But the Navy had another interpretation. The ships had simply stopped to pick up Soviet submarine escorts. The President became quite concerned lest the Navy—already riled because of Presidential meddling in its affairs—blunder into an incident. Sensing the President's fears, McNamara became suspicious of the Navy's procedures and routines for making the first interception. Calling on the Chief of Naval Operations in the Navy's inner sanctum, the Navy Flag Plot, McNamara put his questions harshly.[75] Who would make the first interception? Were Russian-speaking officers on board? How would submarines be dealt with? At one point McNamara asked Anderson what he would do if a Soviet ship's captain refused to answer questions about his cargo. Picking up the Manual of Navy Regulations the Navy man waved it in McNamara's face and shouted, "It's all in there." To which McNamara replied, "I don't give a damn what John Paul Jones would have done; I want to know what you are going to do, now."[76] The encounter ended on Anderson's remark: "Now, Mr. Secretary, if you and your Deputy will go back to your office the Navy will run the blockade."[77]

MODEL III: BUREAUCRATIC POLITICS

The leaders who sit on top of organizations are not a monolithic group. Rather, each is, in his own right, a player in a central, competitive game. The name of the game is bureaucratic politics: bargaining along regularized channels among players positioned hierarchically within the government. Government behavior can thus be understood according to a third conceptual model not as organizational outputs, but as outcomes of bargaining games. In contrast with Model I, the bureaucratic politics model sees no unitary actor but rather many actors as players, who focus not on a single strategic issue but on many diverse intra-national problems as well, in terms of no consistent set of strategic objectives but rather according to various conceptions of national, organizational, and personal goals, making government decisions not by rational choice but by the pulling and hauling that is politics.

The apparatus of each national government constitutes a complex arena for the intra-national game. Political leaders at the top of this apparatus plus the men who occupy positions on top of the critical organizations form the circle of central players. Ascendancy to this circle assures some independent standing. The necessary decentralization of decisions required for action on the broad range of foreign policy problems guarantees that each player has considerable discretion. Thus power is shared.

The nature of problems of foreign policy permits fundamental disagreement among reasonable men concerning what ought to be done. Analyses yield conflicting recommendations. Separate responsibilities laid on the shoulders of individual personalities encourage differences in perceptions and priorities. But the issues are of first order importance. What the nation does really matters. A wrong choice could mean irreparable damage. Thus responsible men are obliged to fight for what they are convinced is right.

Men share power. Men differ concerning what must be done. The differences matter. This milieu necessitates that policy be resolved by politics. What the nation does is sometimes the result of the triumph of one group over others. More often, however, different groups pulling in different directions yield a resultant distinct from what anyone intended. What moves the chess pieces is not simply the reasons which support a course of action, nor the routines of organizations which enact an alternative, but the power and skill of proponents and opponents of the action in question.

This characterization captures the thrust of the bureaucratic politics orientation. If problems of foreign policy arose as discreet issues, and decisions were determined one game at a time, this

[72] *Facts on File*, Vol. XXII, 1962, p. 376, published by Facts on File, Inc., New York, yearly.

[73] This hypothesis would account for the mystery surrounding Kennedy's explosion at the leak of the stopping of the *Bucharest*. See Hilsman, *op. cit.*, p. 45.

[74] Abel, *op. cit.*, p. 153.

[75] See *ibid.*, pp. 154 ff.

[76] *Ibid.*, p. 156.

[77] *Ibid.*

account would suffice. But most "issues," e.g., Vietnam or the proliferation of nuclear weapons, emerge piecemeal, over time, one lump in one context, a second in another. Hundreds of issues compete for players' attention every day. Each player is forced to fix upon his issues for that day, fight them on their own terms, and rush on to the next. Thus the character of emerging issues and the pace at which the game is played converge to yield government "decisions" and "actions" as collages. Choices by one player, outcomes of minor games, outcomes of central games, and "foul-ups"—these pieces, when stuck to the same canvas, constitute government behavior relevant to an issue.

The concept of national security policy as political outcome contradicts both public imagery and academic orthodoxy. Issues vital to national security, it is said, are too important to be settled by political games. They must be "above" politics. To accuse someone of "playing politics with national security" is a most serious charge. What public conviction demands, the academic penchant for intellectual elegance reinforces. Internal politics is messy; moreover, according to prevailing doctrine, politicking lacks intellectual content. As such, it constitutes gossip for journalists rather than a subject for serious investigation. Occasional memoirs, anecdotes in historical accounts, and several detailed case studies to the contrary, most of the literature of foreign policy avoids bureaucratic politics. The gap between academic literature and the experience of participants in government is nowhere wider than at this point.

BUREAUCRATIC POLITICS PARADIGM[78]

I. Basic Unit of Analysis: Policy as Political Outcome

The decisions and actions of governments are essentially intra-national political outcomes: outcomes in the sense that what happens is not chosen as a solution to a problem but rather results from compromise, coalition, competition, and confusion among government officials who see different faces of an issue; political in the sense that the activity from which the outcomes emerge is best characterized as bargaining. Following Wittgenstein's use of the concept of a "game," national behavior in international affairs can be conceived as outcomes of intricate and subtle, simultaneous, overlapping games among players located in positions, the hierarchical arrangement of which constitutes the government.[79] These games proceed neither at random nor at leisure. Regular channels structure the game. Deadlines force issues to the attention of busy players. The moves in the chess game are thus to be explained in terms of the bargaining among players with separate and unequal power over particular pieces and with separable objectives in distinguishable subgames.

II. Organizing Concepts

A. *Players in Positions.* The actor is neither a unitary nation, nor a conglomerate of organizations, but rather a number of individual play-

[78] This paradigm relies upon the small group of analysts who have begun to fill the gap. My primary source is the model implicit in the work of Richard E. Neustadt, though his concentration on presidential action has been generalized to a concern with policy as the outcome of political bargaining among a number of independent players, the President amounting to no more than a "superpower" among many lesser but considerable powers. As Warner Schilling argues, the substantive problems are of such inordinate difficulty that uncertainties and differences with regard to goals, alternatives, and consequences are inevitable. This necessitates what Roger Hilsman describes as the process of conflict and consensus building. The techniques employed in this process often resemble those used in legislative assemblies, though Samuel Huntington's characterization of the process as "legislative" overemphasizes the equality of participants as opposed to the hierarchy which structures the game. Moreover, whereas for Huntington, foreign policy (in contrast to military policy) is set by the executive, this paradigm maintains that the activities which he describes as legislative are characteristic of the process by which foreign policy is made.

[79] The theatrical metaphor of stage, roles, and actors is more common than this metaphor of games, positions, and players. Nevertheless, the rigidity connotated by the concept of "role" both in the theatrical sense of actors reciting fixed lines and in the sociological sense of fixed responses to specified social situations makes the concept of games, positions, and players more useful for this analysis of active participants in the determination of national policy. Objections to the terminology on the grounds that "game" connotes non-serious play overlook the concept's application to most serious problems both in Wittgenstein's philosophy and in contemporary game theory. Game theory typically treats more precisely structured games, but Wittgenstein's examination of the "language game" wherein men use words to communicate is quite analogous to this analysis of the less specified game of bureaucratic politics. See Ludwig Wittgenstein, *Philosophical Investigations,* and Thomas Schelling, "What is Game Theory?" in James Charlesworth, *Contemporary Political Analysis.*

ers. Groups of these players constitute the agent for particular government decisions and actions. Players are men in jobs.

Individuals become players in the national security policy game by occupying a critical position in an administration. For example, in the U.S. government the players include "Chiefs": the President, Secretaries of State, Defense, and Treasury, Director of the CIA, Joint Chiefs of Staff, and, since 1961, the Special Assistant for National Security Affairs;[80] "Staffers": the immediate staff of each Chief; "Indians": the political appointees and permanent government officials within each of the departments and agencies; and *"Ad Hoc* Players": actors in the wider government game (especially "Congressional Influentials"), members of the press, spokesmen for important interest groups (especially the "bipartisan foreign policy establishment" in and out of Congress), and surrogates for each of these groups. Other members of the Congress, press, interest groups, and public form concentric circles around the central arena —circles which demarcate the permissive limits within which the game is played.

Positions define what players both may and must do. The advantages and handicaps with which each player can enter and play in various games stems from his position. So does a cluster of obligations for the performance of certain tasks. The two sides of this coin are illustrated by the position of the modern Secretary of State. First, in form and usually in fact, he is the primary repository of political judgment on the political-military issues that are the stuff of contemporary foreign policy; consequently, he is a senior personal advisor to the President. Second, he is the colleague of the President's other senior advisers on the problems of foreign policy, the Secretaries of Defense and Treasury, and the Special Assistant for National Security Affairs. Third, he is the ranking U.S. diplomat for serious negotiation. Fourth, he serves as an Administration voice to Congress, the country, and the world. Finally, he is "Mr. State Department" or "Mr. Foreign Office," "leader of officials, spokesman for their causes, guardian of their interests, judge of their disputes, superintendent of their work, master of their careers."[81] But he is not first one, and then the other. All of these obligations are his simultaneously. His performance in one affects his credit and power in the others. The perspective stemming from the daily work which he must oversee—the cable traffic by which his department maintains relations with other foreign offices—conflicts with the President's requirement that he serve as a generalist and coordinator of contrasting perspectives. The necessity that he be close to the President restricts the extent to which, and the force with which, he can front for his department. When he defers to the Secretary of Defense rather than fighting for his department's position—as he often must—he strains the loyalty of his officialdom. The Secretary's resolution of these conflicts depends not only upon the position, but also upon the player who occupies the position.

For players are also people. Men's metabolisms differ. The core of the bureaucratic politics mix is personality. How each man manages to stand the heat in his kitchen, each player's basic operating style, and the complementarity or contradiction among personalities and styles in the inner circles are irreducible pieces of the policy blend. Moreover, each person comes to his position with baggage in tow, including sensitivities to certain issues, commitments to various programs, and personal standing and debts with groups in the society.

B. *Parochial Priorities, Perceptions and Issues.* Answers to the questions: "What is the issue?" and "What must be done?" are colored by the position from which the questions are considered. For the factors which encourage organizational parochialism also influence the players who occupy positions on top of (or within) these organizations. To motivate members of his organization, a player must be sensitive to the organization's orientation. The games into which the player can enter and the advantages with which he plays enhance these pressures. Thus propensities of perception stemming from position permit reliable prediction about a player's stances in many cases. But these propensities are filtered through the baggage which players bring to positions. Sensitivity to both the pressures and the baggage is thus required for many predictions.

[80] Inclusion of the President's Special Assistant for National Security Affairs in the tier of "Chiefs" rather than among the "Staffers" involves a debatable choice. In fact he is both super-staffer and near-chief. His position has no statutory authority. He is especially dependent upon good relations with the President and the Secretaries of Defense and State. Nevertheless, he stands astride a genuine action-channel. The decision to include his position among the Chiefs reflects my judgment that the Bundy function is becoming institutionalized.

[81] Richard E. Neustadt, Testimony, United States Senate, Committee on Government Operations, Subcommittee on National Security Staffing, *Administration of National Security,* March 26, 1963, pp. 82–83.

C. *Interests, Stakes, and Power.* Games are played to determine outcomes. But outcomes advance and impede each player's conception of the national interest, specific programs to which he is committed, the welfare of his friends, and his personal interests. These overlapping interests constitute the stakes for which games are played. Each player's ability to play successfully depends upon his power. Power, i.e., effective influence on policy outcomes, is an elusive blend of at least three elements: bargaining advantages (drawn from formal authority and obligations, institutional backing, constituents, expertise, and status), skill and will in using bargaining advantages, and other players' perceptions of the first two ingredients. Power wisely invested yields an enhanced reputation for effectiveness. Unsuccessful investment depletes both the stock of capital and the reputation. Thus each player must pick the issues on which he can play with a reasonable probability of success. But no player's power is sufficient to guarantee satisfactory outcomes. Each player's needs and fears run to many other players. What ensues is the most intricate and subtle of games known to man.

D. *The Problem and the Problems.* "Solutions" to strategic problems are not derived by detached analysts focusing coolly on *the* problem. Instead, deadlines and events raise issues in games, and demand decisions of busy players in contexts that influence the face the issue wears. The problems for the players are both narrower and broader than *the* strategic problem. For each player focuses not on the total strategic problem but rather on the decision that must be made now. But each decision has critical consequences not only for the strategic problem but for each player's organizational, reputational, and personal stakes. Thus the gap between the problems the player was solving and the problem upon which the analyst focuses is often very wide.

E. *Action-Channels.* Bargaining games do not proceed randomly. Action-channels, i.e., regularized ways of producing action concerning types of issues, structure the game by pre-selecting the major players, determining their points of entrance into the game, and distributing particular advantages and disadvantages for each game. Most critically, channels determine "who's got the action," that is, which department's Indians actually do whatever is chosen. Weapon procurement decisions are made within the annual budgeting process; embassies' demands for action cables are answered according to routines of consultation and clearance from State to Defense and White House; requests for instructions from military groups (concerning assistance all the time, concerning operations during war) are composed by the military in consultation with the Office of the Secretary of Defense, State, and White House; crisis responses are debated among White House, State, Defense, CIA, and Ad Hoc players; major political speeches, especially by the President but also by other Chiefs, are cleared through established channels.

F. *Action as Politics.* Government decisions are made and government actions emerge neither as the calculated choice of a unified group, nor as a formal summary of leaders' preferences. Rather the context of shared power but separate judgments concerning important choices, determines that politics is the mechanism of choice. Note the *environment* in which the game is played: inordinate uncertainty about what must be done, the necessity that something be done, and crucial consequences of whatever is done. These features force responsible men to become active players. The *pace of the game*—hundreds of issues, numerous games, and multiple channels—compels players to fight to "get other's attention," to make them "see the facts," to assure that they "take the time to think seriously about the broader issue." The *structure of the game*—power shared by individuals with separate responsibilities—validates each player's feeling that "others don't see my problem," and "others must be persuaded to look at the issue from a less parochial perspective." The *rules of the game*—he who hesitates loses his chance to play at that point, and he who is uncertain about his recommendation is overpowered by others who are sure—pressures players to come down on one side of a 51–49 issue and play. The *rewards of the game*—effectiveness, i.e., impact on outcomes, as the immediate measure of performance—encourages hard play. Thus, most players come to fight to "make the government do what is right." The strategies and tactics employed are quite similar to those formalized by theorists of international relations.

G. *Streams of Outcomes.* Important government decisions or actions emerge as collages composed of individual acts, outcomes of minor and major games, and foul-ups. Outcomes which could never have been chosen by an actor and would never have emerged from bargaining in a single game over the issue are fabricated piece by piece. Understanding of the outcome requires that it be disaggregated.

III. Dominant Inference Pattern

If a nation performed an action, that action was the *outcome* of bargaining among individuals and groups within the government. That outcome included *results* achieved by groups

committed to a decision or action, *resultants* which emerged from bargaining among groups with quite different positions and *foul-ups*. Model III's explanatory power is achieved by revealing the pulling and hauling of various players, with different perceptions and priorities, focusing on separate problems, which yielded the outcomes that constitute the action in question.

IV. General Propositions

1. *Action and Intention.* Action does not presuppose intention. The sum of behavior of representatives of a government relevant to an issue was rarely intended by any individual or group. Rather separate individuals with different intentions contributed pieces which compose an outcome distinct from what anyone would have chosen.

2. *Where you stand depends on where you sit.*[82] Horizontally, the diverse demands upon each player shape his priorities, perceptions, and issues. For large classes of issues, e.g., budgets and procurement decisions, the stance of a particular player can be predicted with high reliability from information concerning his seat. In the notorious B-36 controversy, no one was surprised by Admiral Radford's testimony that "the B-36 under any theory of war, is a bad gamble with national security," as opposed to Air Force Secretary Symington's claim that "a B-36 with an A-bomb can destroy distant objectives which might require ground armies years to take."[83]

3. *Chiefs and Indians.* The aphorism "where you stand depends on where you sit" has vertical as well as horizontal application. Vertically, the demands upon the President, Chiefs, Staffers, and Indians are quite distinct.

The foreign policy issues with which the President can deal are limited primarily by his crowded schedule: the necessity of dealing first with what comes next. His problem is to probe the special face worn by issues that come to his attention, to preserve his leeway until time has clarified the uncertainties, and to assess the relevant risks.

Foreign policy Chiefs deal most often with the hottest issue *de jour*, though they can get the attention of the President and other members of the government for other issues which they judge important. What they cannot guarantee is that "the President will pay the price" or that "the others will get on board." They must build a coalition of the relevant powers that be. They must "give the President confidence" in the right course of action.

Most problems are framed, alternatives specified, and proposals pushed, however, by Indians. Indians fight with Indians of other departments; for example, struggles between International Security Affairs of the Department of Defense and Political-Military of the State Department are a microcosm of the action at higher levels. But the Indian's major problem is how to get the *attention* of Chiefs, how to get an issue decided, how to get the government "to do what is right."

In policy making then, the issue looking *down* is options: how to preserve my leeway until time clarifies uncertainties. The issue looking *sideways* is commitment: how to get others committed to my coalition. The issue looking *upwards* is confidence: how to give the boss confidence in doing what must be done. To paraphrase one of Neustadt's assertions which can be applied down the length of the ladder, the essence of a responsible official's task is to induce others to see that what needs to be done is what their own appraisal of their own responsibilities requires them to do in their own interests.

V. Specific Propositions

1. *Deterrence.* The probability of nuclear attack depends primarily on the probability of attack emerging as an outcome of the bureaucratic politics of the attacking government. First, which players can decide to launch an attack? Whether the effective power over action is controlled by an individual, a minor game, or the central game is critical. Second, though Model I's confidence in nuclear deterrence stems from an assertion that, in the end, governments will not commit suicide, Model III recalls historical precedents. Admiral Yamamoto, who designed the Japanese attack on Pearl Harbor, estimated accurately: "In the first six months to a year of war against the U.S. and England I will run wild, and I will show you an uninterrupted succession of victories; I must also tell you that, should the war be prolonged for two or three years, I have no confidence in our ultimate victory."[84] But Japan attacked. Thus, three questions might be considered. One: could any member of the government solve his problem by attack? What patterns of bargaining could yield attack as an outcome? The major difference between a stable balance of terror and a questionable balance may simply be that in the first case most members of the government

[82] This aphorism was stated first, I think, by Don K. Price.

[83] Paul Y. Hammond, "Super Carriers and B-36 Bombers," in Harold Stein (ed.), *American Civil-Military Decisions* (Birmingham, 1963).

[84] Roberta Wohlstetter, *Pearl Harbor* (Stanford, 1962), p. 350.

appreciate fully the consequences of attack and are thus on guard against the emergence of this outcome. Two: what stream of outcomes might lead to an attack? At what point in that stream is the potential attacker's politics? If members of the U.S. government had been sensitive to the stream of decisions from which the Japanese attack on Pearl Harbor emerged, they would have been aware of a considerable probability of that attack. Three: how might miscalculation and confusion generate foul-ups that yield attack as an outcome? For example, in a crisis or after the beginning of conventional war, what happens to the information available to, and the effective power of, members of the central game.

THE U.S. BLOCKADE OF CUBA: A THIRD CUT

The Politics of Discovery. A series of overlapping bargaining games determined both the *date* of the discovery of the Soviet missiles and the *impact* of this discovery on the Administration. An explanation of the politics of the discovery is consequently a considerable piece of the explanation of the U.S. blockade.

Cuba was the Kennedy Administration's "political Achilles' heel."[85] The months preceding the crisis were also months before the Congressional elections, and the Republican Senatorial and Congressional Campaign Committee had announced that Cuba would be "the dominant issue of the 1962 campaign."[86] What the administration billed as a "more positive and indirect approach of isolating Castro from developing, democratic Latin America," Senators Keating, Goldwater, Capehart, Thurmond, and others attacked as a "do-nothing" policy.[87] In statements on the floor of the House and Senate, campaign speeches across the country, and interviews and articles carried by national news media, Cuba—particularly the Soviet program of increased arms aid—served as a stick for stirring the domestic political scene.[88]

These attacks drew blood. Prudence demanded a vigorous reaction. The President decided to meet the issue head-on. The Administration mounted a forceful campaign of denial designed to discredit critics' claims. The President himself manned the front line of this offensive, though almost all Administration officials participated. In his news conference on August 19, President Kennedy attacked as "irresponsible" calls for an invasion of Cuba, stressing rather "the totality of our obligations" and promising to "watch what happens in Cuba with the closest attention."[89] On September 4, he issued a strong statement denying any provocative Soviet action in Cuba.[90] On September 13 he lashed out at "loose talk" calling for an invasion of Cuba.[91] The day before the flight of the U-2 which discovered the missiles, he campaigned in Capehart's Indiana against those "self-appointed generals and admirals who want to send someone else's sons to war."[92]

On Sunday, October 14, just as a U-2 was taking the first pictures of Soviet missiles, McGeorge Bundy was asserting:

> I *know* that there is no present evidence, and I think that there is no present likelihood that the Cuban government and the Soviet government would, in combination, attempt to install a major offensive capability.[93]

In this campaign to puncture the critics' charges, the Administration discovered that the public needed positive slogans. Thus, Kennedy fell into a tenuous semantic distinction between "offensive" and "defensive" weapons. This distinction originated in his September 4 statement that there was no evidence of "offensive ground to ground missiles" and warned "were it to be otherwise, the gravest issues would arise."[94] His September 13 statement turned on this distinction between "defensive" and "offensive" weapons and announced a firm commitment to action if the Soviet Union attempted to introduce the latter into Cuba.[95] Congressional committees elicited from administration officials testimony which read this distinction and the President's commitment into the *Congressional Record.*[96]

What the President least wanted to hear, the CIA was most hesitant to say plainly. On August 22 John McCone met privately with the President and voiced suspicions that the Soviets were preparing to introduce offensive missiles into Cuba.[97] Kennedy heard this as what it was: the suspicion of a hawk. McCone left

[97] Abel, *op. cit.,* pp. 17–18. According to McCone, he told Kennedy, "The only construction I can put on the material going into Cuba is that the Russians are preparing to introduce offensive missiles." See also Weintal and Bartlett, *op. cit.,* pp. 60–61.

Washington for a month's honeymoon on the Riviera. Fretting at Cap Ferrat, he bombarded his deputy, General Marshall Carter, with telegrams, but Carter, knowing that McCone had informed the President of his suspicions and received a cold reception, was reluctant to distribute these telegrams outside the CIA.[98] On September 9 a U-2 "on loan" to the Chinese Nationalists was downed over mainland China.[99] The Committee on Overhead Reconnaissance (COMOR) convened on September 10 with a sense of urgency.[100] Loss of another U-2 might incite world opinion to demand cancellation of U-2 flights. The President's campaign against those who asserted that the Soviets were acting provocatively in Cuba had begun. To risk downing a U-2 over Cuba was to risk chopping off the limb on which the President was sitting. That meeting decided to shy away from the western end of Cuba (where SAMs were becoming operational) and modify the flight pattern of the U-2s in order to reduce the probability that a U-2 would be lost.[101] USIB's unanimous approval of the September estimate reflects similar sensitivities. On September 13 the President had asserted that there were no Soviet offensive missiles in Cuba and committed his Administration to act if offensive missiles were discovered. Before Congressional committees, Administration officials were denying that there was any evidence whatever of offensive missiles in Cuba. The implications of a National Intelligence estimate which concluded that the Soviets were introducing offensive missiles into Cuba were not lost on the men who constituted America's highest intelligence assembly.

The October 4 COMOR decision to direct a flight over the western end of Cuba in effect "overturned" the September estimate, but without officially raising that issue. The decision represented McCone's victory for which he had lobbied with the President before the September 10 decision, in telegrams before the September 19 estimate, and in person after his return to Washington. Though the politics of the intelligence community is closely guarded, several pieces of the story can be told.[102] By September 27, Colonel Wright and others in DIA believed that the Soviet Union was placing missiles in the San Cristobal area.[103] This area was marked suspicious by the CIA on September 29 and certified top priority on October 3. By October 4 McCone had the evidence required to raise the issue officially. The members of COMOR heard McCone's argument, but were reluctant to make the hard decision he demanded. The significant probability that a U-2 would be downed made overflight of western Cuba a matter of real concern.[104]

The Politics of Issues. The U-2 photographs presented incontrovertible evidence of Soviet offensive missiles in Cuba. This revelation fell upon politicized players in a complex context. As one high official recalled, Khrushchev had caught us "with our pants down." What each of the central participants saw, and what each did to cover both his own and the Administration's nakedness, created the spectrum of issues and answers.

At approximately 9:00 A.M., Tuesday morning, October 16, McGeorge Bundy went to the President's living quarters with the message: "Mr. President, there is now hard photographic evidence that the Russians have offensive missiles in Cuba."[105] Much has been made of Kennedy's "expression of surprise,"[106] but "surprise" fails to capture the character of his initial reaction. Rather, it was one of startled anger, most adequately conveyed by the exclamation: "He can't do that to *me!*"[107] In terms of the President's attention and priorities at that moment, Khrushchev had chosen the most unhelpful act of all. Kennedy had staked his full Presidential authority on the assertion that the Soviets would not place offensive weapons in Cuba. Moreover, Khrushchev had assured the President through the most direct and personal channels that he was aware of the President's domestic political problem and that nothing would be done to exacerbate this problem. The Chairman had *lied* to the President. Kennedy's initial reaction entailed action. The missiles must be removed.[108] The alternatives of "doing nothing" or "taking a diplomatic approach" could not have been less relevant to *his* problem.

These two tracks—doing nothing and taking

a diplomatic approach—were the solutions advocated by two of his principal advisors. For Secretary of Defense McNamara, the missiles raised the spectre of nuclear war. He first framed the issue as a straightforward strategic problem. To understand the issue, one had to grasp two obvious but difficult points. First, the missiles represented an inevitable occurrence: narrowing of the missile gap. It simply happened sooner rather than later. Second, the United States could accept this occurrence since its consequences were minor: "seven-to-one missile 'superiority,' one-to-one missile 'equality,' one-to-seven missile 'inferiority'—the three postures are identical." McNamara's statement of this argument at the first meeting of the ExCom was summed up in the phrase, "a missile is a missile."[109] "It makes no great difference," he maintained, "whether you are killed by a missile from the Soviet Union or Cuba."[110] The implication was clear. The United States should not initiate a crisis with the Soviet Union, risking a significant probability of nuclear war over an occurrence which had such small strategic implications.

The perceptions of McGeorge Bundy, the President's Assistant for National Security Affairs, are the most difficult of all to reconstruct. There is no question that he initially argued for a diplomatic track.[111] But was Bundy laboring under his acknowledged burden of responsibility in Cuba I? Or was he playing the role of devil's advocate in order to make the President probe his own initial reaction and consider other options?

The President's brother, Robert Kennedy, saw most clearly the political wall against which Khrushchev had backed the President. But he, like McNamara, saw the prospect of nuclear doom. Was Khrushchev going to force the President to an insane act? At the first meeting of the ExCom, he scribbled a note, "Now I know how Tojo felt when he was planning Pearl Harbor."[112] From the outset he searched for an alternative that would prevent the air strike.

The initial reaction of Theodore Sorensen, the President's Special Counsel and "alter ego," fell somewhere between that of the President and his brother. Like the President, Sorensen felt the poignancy of betrayal. If the President had been the architect of the policy which the missiles punctured, Sorensen was the draftsman. Khrushchev's deceitful move demanded a strong counter-move. But like Robert Kennedy, Sorensen feared lest the shock and disgrace lead to disaster.

To the Joint Chiefs of Staff the issue was clear. *Now* was the time to do the job for which they had prepared contingency plans. Cuba I had been badly done; Cuba II would not be. The missiles provided the *occasion* to deal with the issue: cleansing the Western Hemisphere of Castro's Communism. As the President recalled on the day the crisis ended, "An invasion would have been a mistake—a wrong use of our power. But the military are mad. They wanted to do this. It's lucky for us that we have McNamara over there."[113]

McCone's perceptions flowed from his confirmed prediction. As the Cassandra of the incident, he argued forcefully that the Soviets had installed the missiles in a daring political probe which the United States must meet with force. The time for an air strike was now.[114]

The Politics of Choice. The process by which the blockade emerged is a story of the most subtle and intricate probing, pulling, and hauling; leading, guiding, and spurring. Reconstruction of this process can only be tentative. Initially the President and most of his advisers wanted the clean, surgical air strike. On the first day of the crisis, when informing Stevenson of the missiles, the President mentioned only two alternatives: "I suppose the alternatives are to go in by air and wipe them out, or to take other steps to render them inoperable."[115] At the end of the week a sizeable minority still favored an air strike. As Robert Kennedy recalled: "The fourteen people involved were very significant. . . . If six of them had been President of the U.S., I think that the world might have been blown up."[116] What prevented the air strike was a fortuitous coincidence of a number of factors—the absence of any one of which might have permitted that option to prevail.

First, McNamara's vision of holocaust set him firmly against the air strike. His initial attempt to frame the issue in strategic terms struck Kennedy as particularly inappropriate. Once McNamara realized that the name of the game was a strong response, however, he and his deputy Gilpatric chose the blockade as a fallback. When the Secretary of Defense—whose department had the action, whose reputation in the Cabinet was unequaled, in whom the President demonstrated full confidence—marshalled

[116] Interview, quoted by Ronald Steel, *New York Review of Books*, March 13, 1969, p. 22.

the arguments for the blockade and refused to be moved, the blockade became a formidable alternative.

Second, Robert Kennedy—the President's closest confidant—was unwilling to see his brother become a "Tojo." His arguments against the air strike on moral grounds struck a chord in the President. Moreover, once his brother had stated these arguments so forcefully, the President could not have chosen his initially preferred course without, in effect, agreeing to become what RFK had condemned.

The President learned of the missiles on Tuesday morning. On Wednesday morning, in order to mask our discovery from the Russians, the President flew to Connecticut to keep a campaign commitment, leaving RFK as the unofficial chairman of the group. By the time the President returned on Wednesday evening, a critical third piece had been added to the picture. McNamara had presented his argument for the blockade. Robert Kennedy and Sorensen had joined McNamara. A powerful coalition of the advisers in whom the President had the greatest confidence, and with whom his style was most compatible, had emerged.

Fourth, the coalition that had formed behind the President's initial preference gave him reason to pause. *Who* supported the air strike—the Chiefs, McCone, Rusk, Nitze, and Acheson—as much as *how* they supported it, counted. Fifth, a piece of inaccurate information, which no one probed, permitted the blockade advocates to fuel (potential) uncertainties in the President's mind. When the President returned to Washington Wednesday evening, RFK and Sorensen met him at the airport. Sorensen gave the President a four-page memorandum outlining the areas of agreement and disagreement. The strongest argument was that the air strike simply could not be surgical.[117] After a day of prodding and questioning, the Air Force had asserted that it could not guarantee the success of a surgical air strike limited to the missiles alone.

Thursday evening, the President convened the ExCom at the White House. He declared his tentative choice of the blockade and directed that preparations be made to put it into effect by Monday morning.[118] Though he raised a question about the possibility of a surgical air strike subsequently, he seems to have accepted the experts' opinion that this was no live option.[119] (Acceptance of this estimate suggests that he may have learned the lesson of the Bay of Pigs—"Never rely on experts"—less well than he supposed.)[120] But this information was incorrect. That no one probed this estimate during the first week of the crisis poses an interesting question for further investigation.

A coalition, including the President, thus emerged from the President's initial decision that something had to be done; McNamara, Robert Kennedy, and Sorensen's resistance to the air strike; incompatibility between the President and the air strike advocates; and an inaccurate piece of information.[121]

CONCLUSION

This essay has obviously bitten off more than it has chewed. For further developments and synthesis of these arguments the reader is referred to the larger study.[122] In spite of the limits of space, however, it would be inappropriate to stop without spelling out several implications of the argument and addressing the question of relations among the models and extensions of them to activity beyond explanation.

At a minimum, the intended implications of the argument presented here are four. First, formulation of alternative frames of reference and demonstration that different analysts, relying predominantly on different models, produce quite different explanations should encourage the analyst's self-consciousness about the nets he employs. The effect of these "spectacles" in sensitizing him to particular aspects of what is going on—framing the puzzle in one way rather than another, encouraging him to examine the problem in terms of certain categories rather than others, directing him to particular kinds of evidence, and relieving puzzlement by one procedure rather than another—must be recognized and explored.

Second, the argument implies a position on the problem of "the state of the art." While accepting the commonplace characterization of the present condition of foreign policy analysis—personalistic, non-cumulative, and sometimes insightful—this essay rejects both the counsel of despair's justification of this condition as a consequence of the character of the enterprise, and the "new frontiersmen's" demand for *a priori* theorizing on the frontiers and *ad hoc* appropriation of "new techniques."[123] What is re-

[122] *Bureaucracy and Policy* (forthcoming, 1969).

[123] Thus my position is quite distinct from both poles in the recent "great debate" about international relations. While many "traditionalists" of the sort Kaplan attacks adopt the first posture and

quired as a first step is non-casual examination of the present product: inspection of existing explanations, articulation of the conceptual models employed in producing them, formulation of the propositions relied upon, specification of the logic of the various intellectual enterprises, and reflection on the questions being asked. Though it is difficult to overemphasize the need for more systematic processing of more data, these preliminary matters of formulating questions with clarity and sensitivity to categories and assumptions so that fruitful acquisition of large quantities of data is possible are still a major hurdle in considering most important problems.

Third, the preliminary, partial paradigms presented here provide a basis for serious reexamination of many problems of foreign and military policy. Model II and Model III cuts at problems typically treated in Model I terms can permit significant improvements in explanation and prediction.[124] Full Model II and III analyses require large amounts of information. But even in cases where the information base is severely limited, improvements are possible. Consider the problem of predicting Soviet strategic forces. In the mid-1950s, Model I style calculations led to predictions that the Soviets would rapidly deploy large numbers of long-range bombers. From a Model II perspective, both the frailty of the Air Force within the Soviet military establishment and the budgetary implications of such a buildup, would have led analysts to hedge this prediction. Moreover, Model II would have pointed to a sure, visible indicator of such a buildup: noisy struggles among the Services over major budgetary shifts. In the late 1950s and early 1960s, Model I calculations led to the prediction of immediate, massive Soviet deployment of ICBMs. Again, a Model II cut would have reduced this number because, in the earlier period, strategic rockets were controlled by the Soviet Ground Forces rather than an independent Service, and in the later period, this would have necessitated massive shifts in budgetary splits. Today, Model I considerations lead many analysts both to recommend that an agreement not to deploy ABMs be a major American objective in upcoming strategic negotiations with the USSR, and to predict success. From a Model II vantage point, the existence of an ongoing Soviet ABM program, the strength of the organization (National Air Defense) that controls ABMs, and the fact that an agreement to stop ABM deployment would force the virtual dismantling of this organization, make a viable agreement of this sort much less likely. A Model III cut suggests that (a) there must be significant differences among perceptions and priorities of Soviet leaders over strategic negotiations, (b) any agreement will affect some players' power bases, and (c) agreements that do not require extensive cuts in the sources of some major players' power will prove easier to negotiate and more viable.

Fourth, the present formulation of paradigms is simply an initial step. As such it leaves a long list of critical questions unanswered. Given any action, an imaginative analyst should always be able to construct some rationale for the government's choice. By imposing, and relaxing, constraints on the parameters of rational choice (as in variants of Model I) analysts can construct a large number of accounts of any act as a rational choice. But does a statement of reasons why a rational actor would choose an action constitute an explanation of the *occurrence* of that action? How can Model I analysis be forced to make more systematic contributions to the question of the determinants of occurrences? Model II's explanation of t in terms of $t - 1$ is explanation. The world is contiguous. But governments sometimes make sharp departures. Can an organizational process model be modified to suggest where change is likely? Attention to organizational change should afford greater understanding of why particular programs and SOPs are maintained by identifiable types of organizations and also how a manager can improve organizational performance. Model III tells a fascinating "story." But its complexity is enormous, the information requirements are often overwhelming, and many of the details of the bargaining may be superfluous. How can such a model be made parsimonious? The three models are obviously not exclusive alternatives. Indeed, the paradigms highlight the partial emphasis of the framework—what each emphasizes and what it leaves out. Each concentrates on one class of variables, in effect, relegating other important factors to a *ceteris paribus* clause. Model I concentrates on "market factors:" pressures and incentives created by the "international strategic marketplace." Mod-

many "scientists" of the sort attacked by Bull adopt the second, this third posture is relatively neutral with respect to whatever is in substantive dispute. See Hedly Bull, "International Theory: The Case for a Classical Approach," *World Politics* (April, 1966); and Morton Kaplan, "The New Great Debate: Traditionalism vs. Science in International Relations," *World Politics* (October, 1966).

[124] A number of problems are now being examined in these terms both in the Bureaucracy Study Group on Bureaucracy and Policy of the Institute of Politics at Harvard University and at the Rand Corporation.

els II and III focus on the internal mechanism of the government that chooses in this environment. But can these relations be more fully specified? Adequate synthesis would require a typology of decisions and actions, some of which are more amenable to treatment in terms of one model and some to another. Government behavior is but one cluster of factors relevant to occurrences in foreign affairs. Most students of foreign policy adopt this focus (at least when explaining and predicting). Nevertheless, the dimensions of the chess board, the character of the pieces, and the rules of the game—factors considered by international systems theorists—constitute the context in which the pieces are moved. Can the major variables in the full function of determinants of foreign policy outcomes be identified?

Both the outline of a partial, *ad hoc* working synthesis of the models, and a sketch of their uses in activities other than explanation can be suggested by generating predictions in terms of each. Strategic surrender is an important problem of international relations and diplomatic history. War termination is a new, developing area of the strategic literature. Both of these interests lead scholars to address a central question: *Why* do nations surrender *when?* Whether implicit in explanations or more explicit in analysis, diplomatic historians and strategists rely upon propositions which can be turned forward to produce predictions. Thus at the risk of being timely—and in error—the present situation (August, 1968) offers an interesting test case: Why will North Vietnam surrender when?[125]

In a nutshell, analysis according to Model I asserts: nations quit when costs outweigh the benefits. North Vietnam will surrender when she realizes "that continued fighting can only generate additional costs without hope of compensating gains, this expectation being largely the consequence of the previous application of force by the dominant side."[126] U.S. actions can increase or decrease Hanoi's strategic costs. Bombing North Vietnam increases the pain and thus increases the probability of surrender. This proposition and prediction are not without meaning. That—"other things being equal"—nations are more likely to surrender when the strategic cost-benefit balance is negative, is true. Nations rarely surrender when they are winning. The proposition specifies a range within which nations surrender. But over this broad range, the relevant question is: why do nations surrender?

Models II and III focus upon the government machine through which this fact about the international strategic marketplace must be filtered to produce a surrender. These analysts are considerably less sanguine about the possibility of surrender *at the point* that the cost-benefit calculus turns negative. Never in history (i.e., in none of the five cases I have examined) have nations surrendered at that point. Surrender occurs sometime thereafter. *When* depends on process of organizations and politics of players within these governments—as they are affected by the opposing government. Moreover, the effects of the victorious power's action upon the surrendering nation cannot be adequately summarized as increasing or decreasing strategic costs. Imposing additional costs by bombing a nation may increase the probability of surrender. But it also may reduce it. An appreciation of the impact of the acts of one nation upon another thus requires some understanding of the machine which is being influenced. For more precise prediction, Models II and III require considerably more information about the organizations and politics of North Vietnam than is publicly available. On the basis of the limited public information, however, these models can be suggestive.

Model II examines two sub-problems. First, to have lost is not sufficient. The government must know that the strategic cost-benefit calculus is negative. But neither the categories, nor the indicators, of strategic costs and benefits are clear. And the sources of information about both are organizations whose parochial priorities and perceptions do not facilitate accurate information or estimation. Military evaluation of military performance, military estimates of factors like "enemy morale," and military predictions concerning when "the tide will turn" or "the corner will have been turned" are typically distorted. In cases of highly decentralized guerrilla operations, like Vietnam, these problems are exacerbated. Thus strategic costs will be underestimated. Only highly *visible* costs can have direct impact on leaders without being filtered through organizational channels. Second, since organizations define the details of options and execute actions, surrender (and negotiation) is likely to entail considerable bungling in the early stages. No organization can define options or prepare programs for this treasonous act. Thus, early overtures will be uncoordinated with

[125] In response to several readers' recommendations, what follows is reproduced *verbatim* from the paper delivered at the September, 1968 Association meetings (Rand P-3919). The discussion is heavily indebted to Ernest R. May.

[126] Richard Snyder, *Deterrence and Defense* (Princeton, 1961), p. 11. For a more general presentation of this position see Paul Kecskemeti, *Strategic Surrender* (New York, 1964).

the acts of other organizations, e.g., the fighting forces, creating contradictory "signals" to the victor.

Model III suggests that surrender will not come at the point that strategic costs outweigh benefits, but that it will not wait until the leadership group concludes that the war is lost. Rather the problem is better understood in terms of four additional propositions. First, strong advocates of the war effort, whose careers are closely identified with the war, rarely come to the conclusion that costs outweigh benefits. Second, quite often from the outset of a war, a number of members of the government (particularly those whose responsibilities sensitize them to problems other than war, e.g., economic planners or intelligence experts) are convinced that the war effort is futile. Third, surrender is likely to come as the result of a political shift that enhances the effective power of the latter group (and adds swing members to it). Fourth, the course of the war, particularly actions of the victor, can influence the advantages and disadvantages of players in the loser's government. Thus, North Vietnam will surrender not when its leaders have a change of heart, but when Hanoi has a change of leaders (or a change of effective power within the central circle). How U.S. bombing (or pause), threats, promises, or action in the South affect the game in Hanoi is subtle but nonetheless crucial.

That these three models could be applied to the surrender of governments other than North Vietnam should be obvious. But that exercise is left for the reader.

A TRANSACTIONAL THEORY OF POLITICAL INTEGRATION AND ARMS CONTROL*

RALPH M. GOLDMAN
San Francisco State College

Nominally, the English became a nation in the eighth century but did not achieve political integration until the seventeenth century, a thousand years later. During the millennium, the English "nation" was the scene of recurring internal wars, the last ending with the acceptance of the Bill of Rights by William III and Mary in 1688. What was the process leading to cessation in the use of armed conflict as a technique of domestic politics in England?

Nominally, Mexico was an independent nation in 1821 but did not see the end of its internal wars until the 1940's. What political process led to domestic "arms control" in Mexico?

Although taking place in different centuries and in nations with distinct political cultures, were there common elements in the two transitions to internal arms control? What were critical factors in the integrative process? May the same factors, or analogous ones, be identified and controlled in contemporary efforts related to regional and international arms control? What may be learned from the English, the Mexican, and other national cases that is generalizable to the problem of international political integration and arms control?

The present theory sketch views arms control as an aspect of the integration of political organizations. Political integration, in turn, is the consequence of a process of political transactions among principal political actors over time. In keeping with numerous contemporary conceptions of social transaction, political "things" of one kind or another are exchanged between actors when *both* (or more) parties perceive or anticipate a "profit," that is, applying their own individual criteria, see a net gain when measuring what is received against what is given up in the transaction. In order to quantify and relate these transactional events to the process leading to political integration, three types of "currency" are postulated: positional, decisional, and materiel currencies. These types are employed in the analysis of the content of each political transaction. The following general hypotheses are then proposed:

1. Successive transactions perceived as profitable by all parties tend to reinforce attitudes of trust among political transactors.
2. Trust among political transactors is positively correlated with sharp increases in the inclusion of decisional currencies among the content of transactions.
3. Increased trust is positively associated with the decline in political exchanges involving armaments (a sub-type of materiel currency), that is, increasing trust and decreasing violent warfare are positively correlated.
4. Transactional sequences that follow a trust-inducing pattern tend to be associated with successful transition from unintegrated to integrated states of political organization.[1]

[1] The distinction between "disarmament" and "arms control" is significant. Neither England nor Mexico, for example, is a domestically disarmed nation. Rather, as a consequence of the processes to be examined with this theory, each nation—as others that are politically integrated—has established a monopoly of its major means of internal violence. Domestic peace, that is, the cessation of internal wars, seems to be associated with conditions of arms *control* (involving decisional currency exchanges) rather than disarmament.

"Political development" and "political integration" are also troublesome terms that should not delay us long. Since World War II, the rubric "political development" has tended to be employed mainly to describe comparative studies of national modernization, particularly with respect to the growth of economic organization and governmental bureaucracies. Overviews of current usage are reported in Samuel P. Huntington, "Political Development and Political Decay," *World Politics*, 17 (April, 1965), 386–430; Fred W. Riggs, "The Theory of Political Development," in J. C. Charlesworth (ed.), *Contemporary Political Analysis* (New York: The Free Press 1967), pp. 317–349; Robert T. Holt and John E. Turner, *The Political Basis of Economic Development* (Princeton, N.J.: D. Van Nostrand, 1966). The approach described in this report is "developmental" simply in its search for recurring tendencies.

* This report is part of an investigation under contract between the Group Psychology Branch, Office of Naval Research, and the Frederic Burk Foundation for Education, San Francisco State College. (Contract Nonr-4722 (00), Project NR 177258). The author is indebted to Luigi Petrullo, Director, Psychological Sciences Division, ONR, and Abraham S. Levine, formerly of the Group Psychology Branch, for their advice and encouragement.

I. TRANSACTIONS, TRUST, AND ORGANIZATIONAL INTEGRATION

Warfare—whether international or domestic—is a "costly" activity. It is costly to be armed. It is costly to expend armaments in military conflicts. The cost may be measured in the usual economic sense; thus, the annual defense budget of the United States during the Korean War rose from $12 billions to $41 billions. The cost may be measured in lives; e.g., President Lyndon B. Johnson's comment, as he signed orders raising the troop commitments to Vietnam: ". . . If I retreated from Vietnam, I believe it would cost us more boys than it would to stay."[2] But history is replete with references to non-pecuniary, non-personnel costs of warfare. Reputedly, Joan of Arc feared bringing her military campaigns to an end lest it cost her the grace of God. Patrick Henry and other libertarians invariably perceive the loss of liberty as costlier than death during resistance; the contemporary version of "give me liberty or give me death" is presumably "better dead than Red."

Evidently cost units other than dollars and lives are critically relevant to political judgments about engaging in or avoiding warfare. One question may be put as follows: Under what conditions do political decision-makers consider the expenditure of military resources, in arms races or actual warfare, to be *too costly* for the political objectives they seek? Deterrence theorists will recognize the variation on a familiar problem: "How much power—military, economic, etc.—do *we* need to make an adversary see the risks and probable costs of *his* war-like acts?" The focus in deterrence theory is on the other decision-maker as *he* perceives and as *he* measures costs.

If cost judgments are at the heart of the choice between warfare and non-warfare, then the problem may be a political-economic one.[3] This is the view taken here. Political integration, and its concomitant arms control and cessation of violence, are viewed hypothetically as consequences of historic series of "political deals," or transactions, wherein adversary political decision-makers pass through a transitional stage beyond which they believe they may regularly get what they want from their dealings with each other by trading "political currencies" less costly than military resources and less risky than warfare. Certain characteristics of these series of political deals, it appears, are importantly related to attitudes of trust, another condition antecedent to the transition to arms control.

Specifically, a theory sketch about political transaction is set forth, in which a typology of political currencies is offered for *ex post facto* analysis of historic exchanges associated with processes of national political integration. Preliminary findings in English and Mexican case studies suggest that internal wars recur until a particular pattern of political transactions, to be described as "Pattern T" below, takes place.[4]

[2] Interview in *Newsweek*, August 2, 1965, p. 21.

[3] Current interest in political economy is surveyed by William C. Mitchell in "The Shape of Political Theory to Come; From Political Sociology to Political Economy," *American Behavioral Scientist*, 11 (November, 1967), 8–37, and in "The New Political Economy," *Social Research*, 35 (Spring, 1968), 76–110. See also, R. L. Curry, Jr., *A Theory of Political Exchange* (Englewood Cliffs, New Jersey: Prentice-Hall, 1969). Particular impetus has been provided by such works as Robert A. Dahl and Charles E. Lindblom, *Politics, Economics and Welfare* (New York: Harper, 1953), Anthony Downs, *An Economic Theory of Democracy* (New York: Harper, 1957), and James M. Buchanan and Gordon Tullock, *The Calculus of Consent* (Ann Arbor: University of Michigan Press, 1962).

[4] Some theoretical difficulties of the case study method of political inquiry are described in Harold Stein (ed.), *Public Administration and Policy Development; A Case Book* (New York: Harcourt, Brace & World, 1952), pp. xx-xxx; also, Bernard Berelson and G. A. Steiner, *Human Behavior* (New York: Harcourt, Brace & World, 1964), p. 27. The logical and empirical pitfalls of *ex post facto* research are succinctly stated in Fred N. Kerlinger, *Foundations of Behavioral Research* (New York: Holt, Rinehart and Winston, 1966), pp. 360 ff., whereas the more general requirements of scientific historiography are discussed in Ernest Nagel, *The Structure of Science* (New York: Harcourt, Brace & World, 1961), Chap. 15; Carl G. Hempel, "The Functions of General Laws in History," in Herbert Feigl and Wilfred Sellars (eds.), *Readings in Philosophical Analysis* (New York: Appleton-Century-Crofts, 1949), pp. 459–471; and Patrick Gardiner, *The Nature of Historical Explanation* (New York: Oxford University Press, 1952). To cope with some of the limitations of *ex post facto* tests of hypotheses, this project anticipates developing a simulation experiment which will presumably permit measurement of player behavior as related to currency transactions, attitudes of trust and suspicion, and other variables of the present theory. For an important attempt to replicate historical events through an experimental simulation, see Charles F. Hermann and Margaret G. Hermann,

The "political currencies" exchanged in the course of this transactional pattern tend to promote attitudes of trust among political transactors. These attitudes in turn facilitate a "critical transitional phase" in national evolution toward domestic arms control, disappearance of internal wars, and political integration.

Transaction Theory

Exchange, or transactional, explanations of political events and behavior have great antiquity. Plato, in discussing the essential activities of inhabitants of a state, observed that "they exchange with one another, and one gives and another receives, each under the idea that the exchange will be for his own good." Aristotle spoke of a conception of "distributive justice" according to which the offices of the state and the rights adhering to these offices are distributed to each citizen in proportion to his contribution to the ends of the state, that is, to a good quality of life. As persons A and B give to the state, in personal merit and personal contribution to its well-being, so A and B receive from the state, in office and honor. After describing this political exchange between citizen and state, Aristotle acknowledged the difficulties arising from different criteria for judging what constitutes a meritorious contribution. Each social class, he observed, tries to have its particular criterion, whether wealth, noble birth, personal goodness, greater numbers, or some other, prevail, thus leading to different forms of state and to the revolutions that change states from one form to another.[5]

A transaction between the citizen and his government is implied in Locke's "social contract." Adam Smith, David Hume, Jeremy Bentham, Thomas Malthus, and the later Utilitarians emphasized the place of each citizen's personal valuational yardstick in the political economy created by the state. James Madison applied a market-place perspective to his analysis of group and governmental relations. Edmund Burke declared:

> . . . All government, indeed every human benefit and enjoyment, every virtue, and every prudent act, is founded on compromise and barter. We balance inconveniences; we give and take; we remit some rights, that we may enjoy others. . . . In every arduous enterprise we consider what we are to lose, as well as what we are to gain. . . . Man acts from adequate motives relative to his interest and not on metaphysical speculation.[6]

The "broker" aspect of the politician's role was alluded to by Sir Henry Maine in his critique of democracy:

> . . . There is no doubt then, in popular government resting on a wide suffrage . . . the leader . . . will be the Wire-puller. The process of cutting up political power into petty fragments has in him its most remarkable product. The morsels of power are so small that men, if left to themselves, would not care to employ them . . . But the political chiffonnier who collects and utilizes the fragments is the Wire-puller.[7]

Lowell carried forward the notion that the politician is primarily a "broker" among group interests; democracy "requires a species of brokerage and one of the functions of politicians is that of brokers." Bentley, Lasswell, Dahl and Lindblom, Downs, and Buchanan and Tullock follow this tradition.[8]

For economists, the exchange concept is fairly well-defined. Together with production and consumption, exchange of goods is a core concern of economics. "Exchange" has been defined in economic theory as "a situation in which each of two parties provides some good(s) to the other." In the more traditional usage, the giving up of goods by one party is contingent upon receipt of goods from the other. A "transaction," then, is an exchange, along with the attendant bargaining or negotiations. There may be two or more parties involved in a transaction, and the parties may be either individuals or organizations.[9]

George C. Homans incorporated elements of classical economics and behavioral psychology

[9] One of the best behavioral formulations is found in Alfred Kuhn, *The Study of Society* (Homewood, Illinois: Irwin-Dorsey Press, 1963).

into his theory of social behavior as a form of exchange or transaction. Homans examines face-to-face contacts between individuals, viewing them as "an exchange of activity, tangible or intangible, and more or less rewarding or costly" to each individual.[10]

"Activity," according to Homans, is a comprehensively descriptive term referring not only to the transfer of objects and materials from one individual to another but also the emission of "sentiments" by one to the other. One person gives advice in exchange for "sentiments" of deference or affection from the other. Neighbors exchange attentions and favors. Members of a seminar exchange ideas. An activity emitted by one is rewarded or punished by an activity emitted by the other, regardless of the kinds of activity each emits.

Consistent with economic theory, Homans views a "cost" as a value foregone. The person who emits an activity must, by doing so, have foregone a *potentially* rewarding alternative activity; the activity foregone is a "cost." A friend who takes time to give advice instead of pursuing some other potential use of his time is incurring a "cost," that is, the foregone time. In exchange, he may, for example, expect affection or deference. If he receives derision or abuse instead, he is likely to consider further transactions with the other person "unprofitable." Further exchanges are likely to decline in frequency or cease.

In Homans' terms, the more costly an activity is to a person, the less often will he emit it. Psychic profit, therefore, is reward less cost. Again, as in traditional economic theory, no exchange of activity continues unless *both* parties believe they are profiting.

Homans illustrates his theory by drawing upon the findings of Blau's study of interpersonal behavior in a bureaucracy. Sixteen agents of a Federal law-enforcement agency were the subjects observed. These men held the same job title, but they varied in competence. The more skilled received more requests for advice and assistance from their co-workers. The recipients of the advice and assistance benefited, but nonetheless at a cost. The agent requesting help usually was rewarded by being enabled to do a better job. He paid the price of implicitly admitting his inferiority to a colleague who, by title, was supposedly his equal. On the other hand, the consultant gained prestige, at the same time incurring the cost of time taken from his own work.[11]

Each agent—advisee and adviser—netted "social profit" if his perceived reward from the interaction exceeded the personal costs. In other words, "social justice" was realized in this transaction if the rewards of both participants were proportional to their respective costs. The criterion of proportionality rests upon each participant's *own* normative expectation, derived though it may be from what he had learned about the nature of "fairness" and "justice" from his social environment.

Kuhn adds the concept "effective preference." The behavior of *each* party to a transaction must be analyzed in order to understand the combined behaviors of *both*. For this purpose, "effective preference" (EP) is "the degree of capacity to get some desired thing plus the will to get it rather than to satisfy conflicting desires." The EP of an individual is determined not only by his subjective desires, but also by his objective opportunities (availability of the goods, his resources for exchange, his capacity for deciding, etc.)[12]

Assume that person A desires good Y and has the resources to enable him to acquire Y, that is, Y lies with A's opportunity system. Whatever A must give up or forego in order to get Y will be called X; that is, X is the objective cost of good Y as far as A is concerned. The objective cost, however, is a poor basis for predicting whether A will incur X in order to obtain Y. His decision depends on the *relative valuation* that A places on X and Y. Let us, then, label his valuation of X as AX and of Y as AY. If, in A's value or preference system, AY is greater than AX, he will incur the cost X to get Good Y. If AY equals AX, he will be indifferent to the transaction, that is, he is equally likely to exchange as not to exchange. If AY is less than AX, person A will keep X and forget about obtaining good Y. In general, A's effective preference (EP) for Y is AY-AX.

Each transactor has his own subjective yardstick for measuring "profit" or "loss," although his membership in various groups may have some cultural influence upon the "units" he employs. Conceivably, it is possible to design an "Equity Scale" to help measure a decision-maker's own valuation of a transaction. An Equity Scale may be based upon an evaluative scale with polar values such as "very profitable for me" and "very costly to me" and a middle interval for "even exchange" or "fair deal." If what he receives (R) in a transaction is worth exactly as much to him as what he gives (G), the ratio between the two (R/G) equals one, or unity. An Equity Scale score of one could be

[10] *Social Behavior: Its Elementary Forms* (Boston: Harcourt, Brace & World, 1961).

[11] Peter M. Blau, *The Dynamics of Bureaucracy* (Chicago: University of Chicago Press, 1955.)

[12] Kuhn, *op. cit.*, pp. 319–20, Chap. 17 ff.

said to describe "a sense of equity." If R is worth more to him than G, then R/G is greater than one, and he presumably experiences a psychic "sense of profit." On the other hand, if R is worth less to him than G, then R/G is less than one, producing "a sense of loss." Such an Equity Scale as suggested here would be a simple ordinal scale that, in some respects, operationalizes Homan's notion of "distributive justice" and Kuhn's "effective preference." As far as the transactor is concerned, he will probably consummate an exchange if he has a sense of profit but refuse to exchange if he experiences a sense of loss. A sense of equity is likely to produce a 50–50 prospect of transaction, the kind of "satisfaction" that adversaries experience when they are about to compromise on each other's minimum terms. "Half a loaf is better than none" perhaps best describes "sense of equity."

However, a transaction is a decision process involving more than one person. Person B must therefore be added to the basic model. Assume that B possesses good Y and desires X for it. The general statement of B's EP is BX-BY. A transaction requires two decisions: A's decision to give up X for Y, and B's decision to give up Y for X.

The preference orderings of two persons must now be examined simultaneously. It will of course be necessary for both X and Y to be valued *somewhat* by A and B, otherwise neither transactor would be interested in keeping the good presently in his possession nor would he seek the good of the other.[13] On the other hand, for a transaction to ensue, some degree of opposite or divergent preference ordering must exist between A and B. Each must want the other's good at least a little more than his own. The possibilities are as follows:

(1) If A and B both prefer Y to X, then A will be willing to offer X for Y, but B will refuse. No transaction. (2) If both prefer X to Y, B will be willing to give Y for X, but A will refuse. No transaction. (3) If A prefers Y to X, and B prefers X to Y, then an exchange is possible. (4) Both A and B prefer Y over X, that is, have the same preference *ordering*, but A places a greater value, that is, would give up more, on Y than does B. Such a difference in relative valuation, even with the same preference orderings, may be sufficient to permit a transaction to take place.

In a bargainable transaction, each person's power to acquire what he desires depends, therefore, not only on his own but also on the other's EP. Only if there is *some minimal overlap* of transactor EPs can a transaction take place. This means that the parties must know about each other, want each other's goods, have information about the respective EPs. With all this having to transpire, very few social interactions would seem likely to end up as successful transactions. On the other hand, the notion of overlap of EPs helps make explicit the important function of marketplaces in bringing potential transactors together in some convenient and rational manner. If a prospective transactor wants to trade in wheat or bonds, for example, he knows exactly where to find persons with prospectively overlapping EPs, that is, in some appropriate marketplace in the United States.

Trust and Suspicion

Time is an important aspect of transactions.[14] The simplest transactions are those in which two parties transfer goods between themselves simultaneously. When the transfers take place at different times, anticipation and trust become significant elements in the situation. The local grocer will extend non-interest credit to a customer until pay-day, that is, he will exhibit an attitude of trust toward the customer in anticipation of a completion of the transaction at some fixed future time. A more complicated economic transaction occurs with the purchase of a house in which the buyer signs a mortgage contract to pay a price, say, $30,000, plus interest, in specific installments over a period of years. In this case, the mortgage company extends trust at an economically acceptable price (the going interest rate) if its investigations establish the trustworthiness (credit standing) of the buyer.

Social and political exchanges, as Blau points out, have somewhat different trust conditions in that they usually entail unspecified obligations. Business transactors can bargain over price and interest rate, but friends can hardly bargain over the expectation that an invitation to dinner will be reciprocated at some future time.[15] Another difference relates to the ambiguity or the

[13] A may of course be willing to exchange X for B's Y in order to facilitate getting C's Z later, but this is an elaboration of the basic model rather than a new model.

[14] ". . . Evolution of trust goes through phases brought on by a time-dependent cognitive reappraisal of the relationship," in the words of Marc Pilisuk, Paul Skolnick, Kenneth Thomas, and Reuben Chapman, "Boredom vs. Cognitive Reappraisal in the Development of Cooperative Strategy," *Journal of Conflict Resolution*, 9 (March, 1967), p. 116. Cf. processes taking place during "critical transition" in the present theory.

[15] Peter M. Blau, *Exchange and Power in Social Life* (New York: Wiley, 1964).

unquantified character of currency units usually involved in social and political exchanges. In Blau's study of Federal investigators, for example, what "units" can measure (1) the advice given by the more competent investigators and (2) the deference returned by the less competent?

Social and political exchanges, therefore, involve transfers that create diffuse rather than precisely specified future obligations and a return that cannot readily be bargained about but must be left to the discretion of the one who makes it. Since there is no way to assure an appropriate return for a social favor, social exchange particularly requires trusting others to discharge their obligations. Typically, according to Blau, exchange relations evolve as a slow process, usually starting with minor transactions requiring little trust as well as little risk. By discharging such obligations for goods or services received, individuals demonstrate their trustworthiness, leading to gradual expansion of mutually equitable exchanges, in turn leading to further growth of mutual trust. Examples readily come to mind; e.g., the borrower who repays a small loan promptly in order to establish his credit standing for a larger loan.

What if a transactor receiving goods fails to keep his promise to pay or leaves unfulfilled the arranged return of goods? In the usual economic transaction, "foreclosure" is a familiar response by the giving transactor. Non-payment of a mortgage at the scheduled rate leads to a forfeiture of "the stake," namely the house and all previous payments on it. Termination of a credit standing is a kind of foreclosure, that is, loss of the opportunity to possess goods in advance of cash payment. In social and political exchanges, unkept promises and unreturned obligations lead to the loss of such "stakes" as friendship, reputation, peace, honor, credibility, opportunities for affiliation, etc. Transaction relationships may become less trusting, transactors less attractive to each other, and grounds for cooperation or coalition less tenable. If enough suspicion is created, one of the transactors may, usually at some risk, try to take back the goods transferred in the first phase of the exchange. Thus, for political transactions in which transfers of currencies are spread over time rather than completed simultaneously, attitudes of trust or suspicion by the transactors toward each other become operative and influential.

A familiar example from American history may be drawn from the events following the Compromise of 1850. In the Congressional actions based upon the Compromise, the North succeeded in having California admitted as a non-slave state and having slave trade abolished in the District of Columbia. The South won a promise of enactment of stricter Federal statutes dealing with the return of runaway slave property. Although the promise was technically implemented by passage of a Fugitive Slave Act, the spirit of the Act, from the Southern point of view, was undermined by the Northern "underground railroad" for helping slaves escape and by other local interferences with Federal enforcement. The South perceived the latter activities as breach-of-promise and grounds for distrust of Northern intentions. All through the 1850's, of course, event after event broadened the distrust between the two sections.[16]

Organizational Integration

A nation, like any other group or organization, may become politically "integrated," a state of affairs whose parameters at best continue to be difficult to operationalize. Ake, for example, suggests several possible empirical indicators of political integration: (1) the extent to which the citizens of a state identify with the state as an embodiment of their interest and therefore concede that it deserves their loyalty and the authority to exercise certain powers

[16] Political scientists are becoming increasingly aware of the central importance of trust attitudes in political and social relations. Most of the work, however, continues to be done by sociologists and psychologists. The trust-suspicion factor is expounded and experimented with by the following: William A. Gamson, *Power and Discontent* (Homewood, Ill.: Dorsey Press, 1968), Chap. 3; M. Deutsch, "Trust and Suspicion," *Journal of Conflict Resolution,* 2 (December, 1958), 265–279, and "Some Considerations Relevant to National Policy," *Journal of Social Issues,* 17 (1961), 57–68; M. Deutsch and R. M. Krauss, "Studies in Interpersonal Bargaining," *Journal of Conflict Resolution,* 6 (March, 1962), 52–76; Harold Garfinkel, "A conception of, and Experiments with, 'Trust' as a Condition of Stable Concerted Actions," in O. J. Harvey (ed.), *Motivation and Social Interaction* (New York: Ronald Press, 1963), pp. 187–238; E. D. Hoedemaker, "Distrust and Aggression: An Interpersonal-International Analogy," *Journal of Conflict Resolution,* 12 (March, 1968), 69–81; B. Lieberman, "i-Trust: A Notion of Trust in Three-Person Games and International Affairs," *Journal of Conflict Resolution,* 8 (September, 1964), 271–280; Marc Pilisuk *et al.*, "Honesty, Deceit, and Timing in the Display of Intentions," *Behavioral Science,* 12 (May, 1967), 205–215; G. H. Shure and R. J. Meeker, "A Personality/Attitude Schedule for Use in Experimental Studies," *Journal of Psychology,* 65 (1967), 233–252.

over them; (2) the degree of preference political actors have for extraconstitutional rather than constitutional actions; (3) political violence as a special type of extraconstitutional behavior which, if frequent, suggests that the normative political culture is still in an embryonic stage; (4) the number of groups wishing to secede from the political system; (5) the extent to which major political groups, such as political parties, competing for control of the government draw their support from a diversity of regions and groups within the country; (6) the extent to which loyalty of members of the political system is focused on office rather than on charismatic appeal of the holder of an office; and (7) the availability of the state's coercive resources.[17]

Others write of "political integration" as a process involving such factors as: shifting loyalties and expectations; jurisdiction; a participant community; progressive reduction of cultural and regional tensions and discontinuities; and value consensus.[18]

Another conception of political integration could undoubtedly be derived from group and organization theory. According to most students of the subject, a human "group" comes into being when two or more persons engage in a minimum frequency of interaction in response to some shared attitude (or shared characteristic about which they have a common attitude) which produces among them specific uniformities of behavior. An "organization" has been defined as a system of consciously coordinated personal activities or forces that comes into being when (1) there are two or more persons able to communicate with each other (2) who are willing to contribute action (3) to accomplish a common purpose.[19]

All social transactions are a concomitant of group or organizational life. By definition, an exchange must be engaged in by two or more persons or groups. For each person to perceive a prospective exchange as profitable (a necessary condition for consummating the transaction), he, along with the other transactor, must attach some value to the thing or currency being negotiated. Each person's valuation of the currency may be different in degree, but each must to some degree value it. The more valuable a goal to the individual, the more effort he will put into group activities designed to achieve the goal. In transactional terms, a group is "integrated" when most of its members think it more costly to contribute effort and resources elsewhere than to the group. Affiliation and effort by a member continue so long as he thinks it is "worth doing business" with the particular group, according to whatever subjective valuational yardstick he may apply. When the members of a group prefer its goals, remain in communication with other members, contribute effort to implement these goals, and participate in group decision-making, the group may be described as "integrated." Conversely, "disintegration" is characterized by manifestations of goal-dissatisfaction, low morale, membership inertia, non-communication, or disaffiliation of members.

The durability of "group integration" is invariably a probabilistic condition; in the life of human groups, disintegration and demise are always a possibility. However, if most group members experience (a) a sense of profit during most transactions with the group, (b) reinforced attitudes of trust toward group leaders and fellow-members, and (c) increased transactional opportunity at declining subjective cost, then intra-group transactions may become "irrevocable."

The department store "clearance sale" is a familiar commercial example of an "irrevocable" transaction. The merchant interested in disposing of an inventory of goods, at the same time covering all costs, will announce a "clearance sale" in which prices are irreducibly low and all sales are declared "final." The latter requirement reflects the fact that the reduced prices leave him no margin for either risks or clerical overhead associated with returns of goods. On the other hand, buyers, just as interested in minimizing expenditures, will take special pains to examine goods prior to purchases, unless, of

[17] Claude Ake, *A Theory of Political Integration* (Homewood, Ill.: Dorsey Press, 1967), pp. 8–11.

[18] An excellent empirical study of political integration, employing a content analysis of the American colonial press, is Richard L. Merritt's *Symbols of American Community, 1735–1775* (New Haven: Yale University Press, 1966). For an outstanding attempt to cope with the logical and empirical issues of defining "integration," see Johan Galtung, "A Structural Theory of Integration," *Journal of Peace Research* (1968), No. 4, pp. 375–95. According to Galtung, integration is "the process whereby two or more actors form a new actor."

[19] For development of these definitions, David B. Truman, *The Governmental Process* (New York: Knopf, 1951); Chester Barnard, *The Functions of the Executive* (Cambridge: Harvard University Press, 1938); James G. March and Herbert A. Simon, *Organizations* (New York: Wiley, 1958); and Bertram M. Gross, *The Managing of Organizations* (New York: Free Press, 1964).

course, the merchant is a trusted seller in the community. Any attempt to reverse the transaction, that is, take back or return goods, would involve unwanted costs to both transactors. The transaction, in this cost-analysis sense, is then "irrevocable." The greater the number and significance of irrevocable transactions among members of a group, the more integrated the group presumably is.

"Irrevocable transaction," then, is another feature of organizational integration, including the integration of a nation or a world organization. In view of the constant search for "irrevocable" arms control arrangements in international politics, data about irrevocable transactions would undoubtedly be an important part of an *ex post facto* search into the transactional histories of nations.

II. BEHAVIORAL AND POLITICAL CURRENCIES: A TYPOLOGY

What is exchanged in a transaction? The economists, who have made the most extensive use of the "transaction" concept, have had perhaps the easiest task of identifying the objects exchanged, for they have been relatively material, observable, and quantifiable. Human commerce over the centuries has led to a specific identification of things transacted: goods, services, currencies, etc. For social exchanges, Homans added "sentiments" and "activities." For the purposes of the present theory, "transactable things" are called "currencies." A "currency" is any empirically observable object, action, or condition perceived as valuable by a particular set of interacting persons (or groups) and capable of being transferred or transmitted by one to the other in a transaction.

As suggested earlier, all social transactions are a concomitant of group and organizational life. Shared values are an essential element in the formation of human cooperative systems. Groups come into being when two or more persons hold in common at least one attitude about some goal. Each member of the group contributes effort toward the implementation of the goal in direct ratio to the worth he attaches to the goal. Among the principal behaviors generated in groups and organizations are those relating to (1) the performance of tasks intended to implement either the group goal or the group's response to a shared attitude; (2) the accomplishment of collective decisions, and (3) the utilization of material resources. These principal types of behavior, respectively, are theoretically exchangeable as *positional, decisional,* and *materiel* currencies. Thus, the present theory offers a general typology of behavioral and political "currencies" derived from theoretical characteristics of all groups and organizations.

Positional Currencies

To help in their immediate decisions and actions, the members of a group, or their leaders, will analyze the goal into specific tasks whose accomplishment is then delegated to particular individuals. These are "task expectations."[20] Sets of task-expectations comprise the "positions" in an organized group. The more a group believes that a particular set of tasks or skills will be instrumental in moving it to its goal, the more will that group esteem the position and reward its incumbents. A group position or incumbency therein, therefore, may be a valuable good or currency amenable to exchange in social transactions. The job patronage given by party leaders in exchange for party service is a well known example.

When organizations, including governments, are created, positions are also brought into being. Such positions are usually given (a) a name, (b) a set of tasks to perform, (c) conditions of investiture, according to which the group places into incumbency in the position some particular person, and (d) conditions of divestiture, according to which the group may remove an incumbent from a position. Each of these four aspects of *incumbency* may become negotiable and exchangeable sub-types, or "denominations," of currency in political transactions.

(a) *Position name.* If a position is created and named by a group, the naming may be part of a significant transaction. Should the executive head of the new Federal Union (in 1787) be called "king" or "president"? Should the chief executive office of the United Nations be called "president" or "secretary-general"? These naming questions may carry a number of implications for valued political symbolisms. "President" implies a republican government; "king" implies a monarchy; "chairman" suggests a committee form of executive leadership; etc.

(b) *Task specification.* The creation, assignment, and withdrawal of duties or task-expectations associated with an office may be another sub-type of incumbency currency. Task specification requires information and judgments about the following kinds of issues: What are the odds that particular tasks will produce particular events leading to the goal? What member talent is available that is most relevant to an adequate

[20] Defined in this author's "A Theory of Conflict Processes and Organizational Offices," *Journal of Conflict Resolution,* 10 (September, 1966), 331-334.

performance of the tasks expected? How are conflicting estimates of the success of particular instrumental activities—the fight over "means"—to be reconciled with job descriptions? How may the group compensate for inadequate performance by an irremovable incumbent? On each issue, the specification and allocation of tasks may become negotiable currency. For example: "If you let my group (because it knows so much about farming) influence the policies that tell the Secretary of Agriculture what he should be doing, we'll agree that your group (because it knows so much about business) influence what the Secretary of Commerce should be doing."

(c) *Legitimizing conditions.* The relationship between a person and a position when the former "fills" the latter is an "incumbency." When an organization prescribes the legitimizing conditions that signal a conclusive choice of incumbent for a position, the elements of that prescription become negotiable currency. The design of the Electoral College method for electing a president, for example, was the result of transactions in legitimizing conditions.

(d) *Divesting conditions.* To create a vacancy in a position is, in effect, to increase the number of incumbencies available for political transaction. For example, in the heyday of Federal post office patronage (1850–1890), tens of thousands of postmasters customarily resigned or failed to have their appointments renewed each time a different political party captured the Presidency. This made way for appointment of the loyal rank-and-file of the winning party. Sometimes, if divesting conditions are not specified or operable, the creation of a vacancy may become quite costly—as in the case of wars, revolutions, assassinations, or *coups d'état* aimed at removing incumbents from office.

Decisional Currencies

Groups, like individuals, must make choices. A group may delegate, by fiat or silent acquiescence, all of its decisional activity to a single individual, a familiar arrangement in dictatorships. At the opposite pole, a group may require the explicit and unanimous consent of all its members before adopting an alternative. Between these extremes are the countless other collective decision-making procedures invented by mankind, including such familiar types as the Quaker "sense of the meeting" and the "majority rule" voting arrangements of democratic representative assemblies.

Whether the group consists of only two persons, e.g., husband and wife, or millions of persons, e.g., the American presidential electorate, its decision-making is normally a matter of selecting one of two or more perceived and available alternatives of action. What is presumably decided is the action alternative most likely, in the minds of group members, to be instrumental in moving the group toward its goal. The greater a member's weight or *share* in the collective decision process, the more likely will *his* valuation of group goals and *his* interpretation of the best means for achieving those goals prevail. "Power" is generally viewed as a matter of sharing in or influencing collective decisions. It follows, then, that decisional units (*shares* in collective decision) may be a valuable currency.

Invariably, decision-making is an individual act or event. Group or collective decision-making, therefore, requires some "method" for summarizing relevant individual decisions in order to discover and act upon the group's choice of alternatives.[21] As a consequence, any arrangement for distributing or sharing collective decision-making prerogative requires a system of participation that may be analyzed into the following components: *Who* takes *what part* in deciding *what kinds of matters* and on *what occasions*? Each of the underscored components may be considered a sub-type, or denomination, of decisional or *shares* currency.

Politicians are conspicuously concerned about trading with shares of prerogative in the collective decisions of the community. To distribute shares of participation in collective decision-making is to establish an organized structure of power dispersion. This leads politicians to analyze and transact solutions to the question above. Political inventors over the centuries have produced a variety of arrangements dealing with each of the components of this question: (a) the attributes that identify "who"; (b) the units of participation that prescribe "what party"; and (d) the situational conditions that identify "occasions." *Prima facie* evidence of a formally arranged system of participation may usually be found in constitutions, statutes, treaties, and similar documents.

(a) *Personal attributes.* The identification of those who shall participate is a major negotiable shares currency. Historically, participation in collective decision-making was first extended to groups rather than to individuals. For example, the House of Lords and House of Commons, as organized groups in the early English Parliament, negotiated with the king for prerogatives in certain public decisions.

In designating different classes of participants, many political communities often indicate who shall be *excluded* from participation as well

[21] Buchanan and Tullock, *op. cit.*

as who shall be *included*. A partial list of the criteria of eligibility for candidacies or for suffrage privileges shows the range of categories that has developed: citizen status; a minimum age; residence or other geographical restrictions; registered party membership; nomination by a party; educational achievements and literacy skills; real or personal property ownership; membership in one or the other sex; payments of taxes or special fees; religious qualifications; mental or penal disqualifications; race, nationality, or belief requirements; oaths of loyalty; etc.

(b) *Units of participation*. What part a participant shall have in choice-making usually refers to his "weight" in voting units. Shall the vote of each participant weight equally with that of every other? Shall the "say" of certain participants weigh more heavily than others in the distribution of votes? These questions run through the history of voting and apportionment systems. Every plan of apportionment is controversial because some group inescapably gets more currency than others. One standard of equality among voting units may create a bias under some other standard, e.g., the equal representation of small and large states in the U. S. Senate.

(c) *Substantive topics*. Types of issues are another basis for parceling out participation. Usually, certain topics or issues may be included within the scope of decision of certain types of participants acting on behalf of the entire community. The Constitution, for example, has many such specifications: only Congress may declare war; only the House of Representatives may initiate tax measures; only the President may grant pardons.

Sometimes certain issues are *excluded* entirely from the decision prerogative of the collectivity, to be left entirely to the choice of individuals. Bills of rights are the most common place for such constraining specifications. Religious affiliation, for example, is subject only to individual, never collective, decision in the United States.

(d) *Situational conditions*. Kinds of occasions are a fourth denomination in the shares currency. These are certain types of situations, frequently identified in law or procedure, whose existence may trigger the exercise of shares. Specification of such situations may place important limits upon power dispersion. For example, in a parliamentary system, a legislative vote of "no confidence" in the incumbent ministry may trigger a general election, whereupon voter participation becomes operative. In war or national emergency situations, usually carefully described in law, the President is allowed to become a "constitutional dictator," with unusual prerogatives for deciding certain matters.

Materiel Currencies

This is perhaps the most familiar of the types of currencies. In economics it is usually referred to as "merchandise," wares," "commodities," "services," etc. The term "materiel," as employed here, pertains to things of physical matter: iron ore, houses, foodstuff, bombs, clothing, typewriters, etc. In ordinary commercial practice, most materiel currencies are assigned a price in monetary units, so that an automobile may be worth $2,000, a typewriter $200, or a loaf of bread 20 cents. Money has itself become a materiel commodity with fluctuating value; as every loan company knows, money is worth much more just before pay-day than just after.

A substantial portion of human activity is devoted to the acquisition, conversion, and utilization of the resources found in the environment, for example, into food to satisfy hunger, clothes to provide warmth, housing to give protection from the elements, vehicles to help move people and goods about, and so on. Civilization has, of course, elaborated these basic activities with advanced technologies.

Materiel currencies, like other currencies, are valued to the extent that they are perceived as instruments for the achievement of desired goals. Cultural influences are often crucial in establishing the valuableness of materiel; the aborigine is hardly a "ready" audience for televised toothpaste commercials.

An overwhelming proportion of what may be called governmental business is usually conducted with materiel, or *commodity*, currencies; so much so that Karl Marx and other political economists came to believe that economic considerations determine all operations of government. Even less ideological documents, such as party platforms, textbooks on public policy-making, etc., are largely discussions of demands for and allocations of government funds, services, goods, credit, and armaments.

(a) *Government funds*. Government funds are those monies collected into the public treasury through tax receipts and other revenue sources, to be re-allocated by public officials. A legislature may appropriate public funds for highway construction, but a public official must let the contract. For this reason, a political party may expend great resources to put its candidates into public office, for this office may determine which "friendly" contractors shall receive the construction work.

(b) *Government services*. Government services rendered by personnel under the direction of public officers and supported by government funds are frequently used as a barter type of

substitute for materiel or money e.g., the use of the services of military personnel in a disaster area to help rebuild a community. A Federal agency, the Coast Guard, for example, may render valuable service to port communities by providing emergency aid to private craft sailing in these areas for pleasure or business; for port communities this service is as good as money. Some government services are difficult to classify or measure as materiel currency. What, in dollar or materiel units, is an efficient traffic control service worth to the members of a community in "units" of physical safety, hours saved in transit, and orderly flow of daily business?

(c) *Government goods.* Many public agencies are producers of economic goods. There are "government goods" because of some special circumstance under which they are produced, processed, or sold. Government operated or controlled dams produce electricity. Government agencies purchase surplus agricultural products for resale or gift to foreign nations. Prisons are public agencies whose inmates may produce saleable goods.

(d) *Government credit.* A fourth denomination of materiel currencies is government credit. This has become increasingly prominent in American political transactions during recent decades. Low-interest loans to farmers or homeowners are now a well-established form of aid to these important contributers to the Nation's prosperity. Government credit is also extended in the granting of veteran loans and small business loans.

(e) *Armaments.* A somewhat special sub-type of material currency are weapons, or armaments. The dictionary definition of "armament" is a convenient point of departure: "equipment for hostile action." A hammer is a piece of materiel used as equipment in construction, that is, until it happens to be used as a piece of equipment for committing murder. In the latter situation, a "construction tool" is identified as a "murder weapon." Obviously, classification as "weapon" is contingent upon *purposive* and *situational* factors: the intention of the user; the weapon; the moral category into which the purpose is placed by society; perhaps the name assigned in conversation, e.g., "This hammer would make quite a *murder weapon,*" or "This hunting rifle can be used as a *revolutionary weapon.*"

A weapon, therefore, is a physical device intended to destroy, damage, or otherwise disrupt life and property. Such devices become weapons only among persons who (a) recognize the destructive potentiality of the device under circumstances of conflict and (b) place value upon particular lives and property. The aborigine who has never seen a gun can hardly be threatened with it until its effects are demonstrated and become important to him.

One distinctive characteristic of armaments is the significance of their *anticipated* use; that is, a gun may be as important as an unfired threat as it is when fired even though never used in violent exchanges. Also, armaments may *deny* rather than *give* the transactor things of value (life, property), in effect, reduce the negotiable and bargainable currencies available to the other transactor. To "trade shots" is the essence of a transaction involving armament currency.

Some may prefer to call armaments a "negative commodity," that is, materiel manufactured to destroy and be destroyed, in effect, wasted. But this is not entirely an accurate characterization. A tax dollar spent on guns is a tax dollar less for schools, but a railroad built for military transport may also serve as civilian transport. A pilot trained to fly bombers may also be employed by civilian airlines. In this sense, armaments are government commodities, sometimes totally expendable, sometimes convertible to non-destructive uses. It is the latter convertibility that produces the surprising affluence often associated with war-time economies; not all armament spending need be an economic "waste."

III. POLITICAL TRANSACTIONS RELEVANT TO ARMS CONTROL

The typology of general "behavioral currencies" proposed in this paradigm or sketch of a transactional theory, then, consists of three classes: *positional, decisional,* and *materiel.* The "political currencies" identified as counterparts or derivatives of these more comprehensive behavioral currencies consist of *incumbencies* (positional), *shares* (decisional), and *commodities* (materiel). While the definitions of the political currencies fall short of being well-operationalized at this time, the requirement is made that their referents be valuable, observable, and transferable in political transactions.

In an investigation reported elsewhere[22] this typology of political currencies was employed to code the content of political transactions occurring in seventeenth century England and twentieth century Mexico, more specifically, the period 1603–1708 in England and the period 1910–1940 in Mexico. In each case, long periods of recurrent internal war were followed by a cessation of internal wars, national political inte-

[22] See cited Final Technical Report entitled "A Transactional Theory of Political Integration and Arms Control" (November 1968), Office of Naval Research Project NR 177258, Contral Nonr-4722 (00).

gration, and domestic arms control. In the two cases, a common pattern of transacted political currencies was identified.

This pattern suggests the existence of three distinct stages in the development of integrated political communities: (1) an Unintegrated Stage, (2) a Critical Transition, and (3) an Integrated Stage, the latter including arms control arrangements. It was also found important to separate out the armament from the other denominations (sub-types) of commodities currency in order to reveal more clearly the trend concluding in arms control. Thus, the frequencies of four, rather than three, currency types were observed. The four included incumbencies, shares, non-armament commodities, and armament commodities.

In the two cases, the Unintegrated Stage saw a high frequency of *armament* exchanges and very few transacted *incumbencies*. This seemed to reflect the recurrence of internal wars, usually wars about who should sit on the throne or in the presidency; that is, incumbencies as such were not traded, but instead captured by force of arms. In contrast, the Integrated Stage was marked by highly frequent transactions in *incumbencies* and eventually none in *armaments*, the consequence, undoubtedly, of arrangements making *incumbencies* more available for political "deals" in the national marketplace.

The pattern through the three stages shows an over-all rise in transactions involving *shares* currencies. This rise goes up sharply during the Critical Transition, suggesting that *transactions in shares (decisional) currencies are the most important taking place during the Critical Transition*. This would seem to reflect intensive efforts to disperse, share, or otherwise re-arrange the collective decision prerogatives within the national organization. The pattern also suggests that, if shares transacted during the Critical Transition prove to be unprofitable to the major transactors, transactional activity reverts or "loops back" to the frequencies typifying the Unintegrated Stage. In the English and Mexican cases, the deals turned out to be "profitable," and the Critical Transition was successfully navigated into the Integrated Stage. Thus, in passing through the Critical Transition to national integration, *a rising frequency in shares transactions is associated with a sharp decline in violent exchanges of armament commodities.*

Finally, the Integrated Stage experiences a rising rate of incumbency and non-armament commodity transactions. This seems to reflect a regularization of non-violent means for gaining office, the practice of only temporarily controlling the government, as well as growth in relative numbers of governmental positions available for trading. The rising non-armament commodity transactions are, of course, a familiar indicator of peace. Prosperity tends to be growth of economic activity and resources under conditions of peace. This aspect of the transactional pattern may be seen as further confirmation of the proposition that, contrary to Marxist assumptions, peace, not war, is "good for business."

Impressionistic evidence derived from the two case studies indicates another factor appearing to correlate with the integrating pattern, namely, a trust-suspicion factor. Even though transactors reach a level of frequent transaction of shares currencies, previous violent armament exchanges between them are not likely to be conducive to attitudes of trust toward each other. In fact, the contrary has the greater probability; suspicion is the more probable attitude under the usual historical circumstances. *Creation of an environment of transactor trust appears to be the most important consequence of shares exchanges during the Critical Transition period.* Once trust is engendered, transactional activity involving non-armament currencies seems also to be facilitated.

Put another way, observation of transactional histories seems to isolate specific exchange conditions under which attitudes of trust or suspicion may be generated. Conditions leading to trust between transactors may facilitate the surmounting of bargaining hurdles during a Critical Transition period in national political integration. Conditions leading to suspicion, on the other hand, may heighten the negotiating and transactional hurdles to an insurmountable degree, returning the transactors to disintegrative patterns, particularly to armaments exchanges.

These findings may also be interpreted as describing part of the dynamics of evolving representative institutions, suggesting a theory of the development of systems of representation. Representation presumably disperses power (decisional currency) so as to assure comprehensive participation in collective decisions, which in turn promotes trust among transactors, commitment to the political organization, and reduction in the perceived need for armament expenditures. As Charles A. Beard and John D. Lewis note in their survey of "Representative Government in Evolution":

> . . . During the thousands of years which we call antiquity, monarchies, despotisms, dictatorships, tyrannies, democracies, and aristocracies, with numerous variants, rose, flourished, and fell; but nowhere, at no time, did representative institutions appear, at least on any impressive scale. . . .

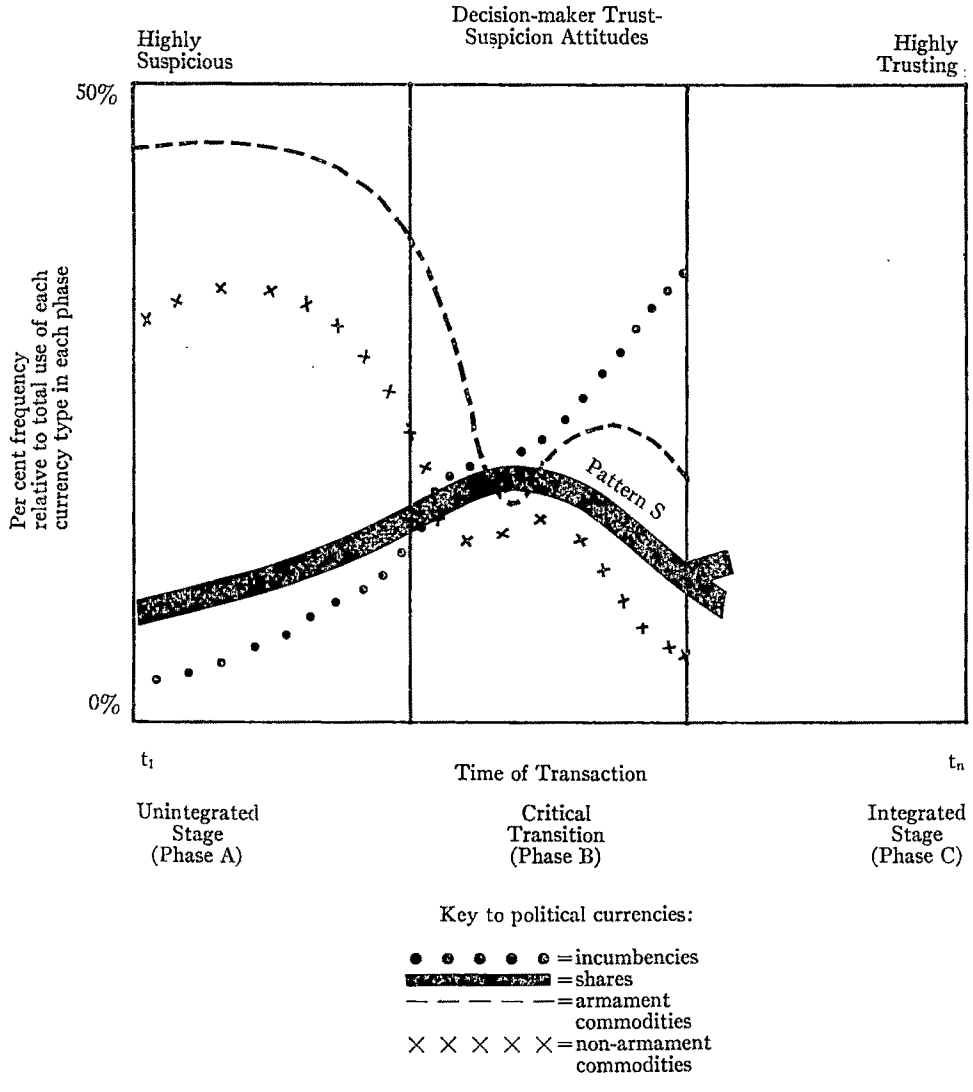

FIGURE 1. Political Currencies Transacted Over Time, Showing Hypothesized Suspicion-inducing Pattern (Pattern S).

The starting point of representative government on a national scale, then, is the Middle Ages in time, and the place is Europe. . . . The monarchs who first called representatives of communities or estates [shares] to grant money [commodities] were not thinking of democracy; they were concerned primarily with the conservation of the peace, the administration of lucrative justice, and the replenishment of their royal treasurier. . . .[23]

Insights provided by the English and Mexican case studies, therefore, suggest testing a relatively ancient political proposition: Dispersed and shared power (decisional currency) is a major contingent factor in promoting attitudes of trust associated with cessations in the use of means of violence (armament commodities) in political transactions. In such a test, the consummated political transactions would be observed, the content of these transactions would be classified as political currencies, that is, as incumbencies, shares, or commodities. The specific major hypotheses would probably be:

a. Rises in frequency of transacted shares (decisional) currencies are positively correlated with attitudinal shifts from suspicion to trust among political transactors.

b. Transactional sequences that follow the

[23] This REVIEW, 26 (April, 1932), 223–240.

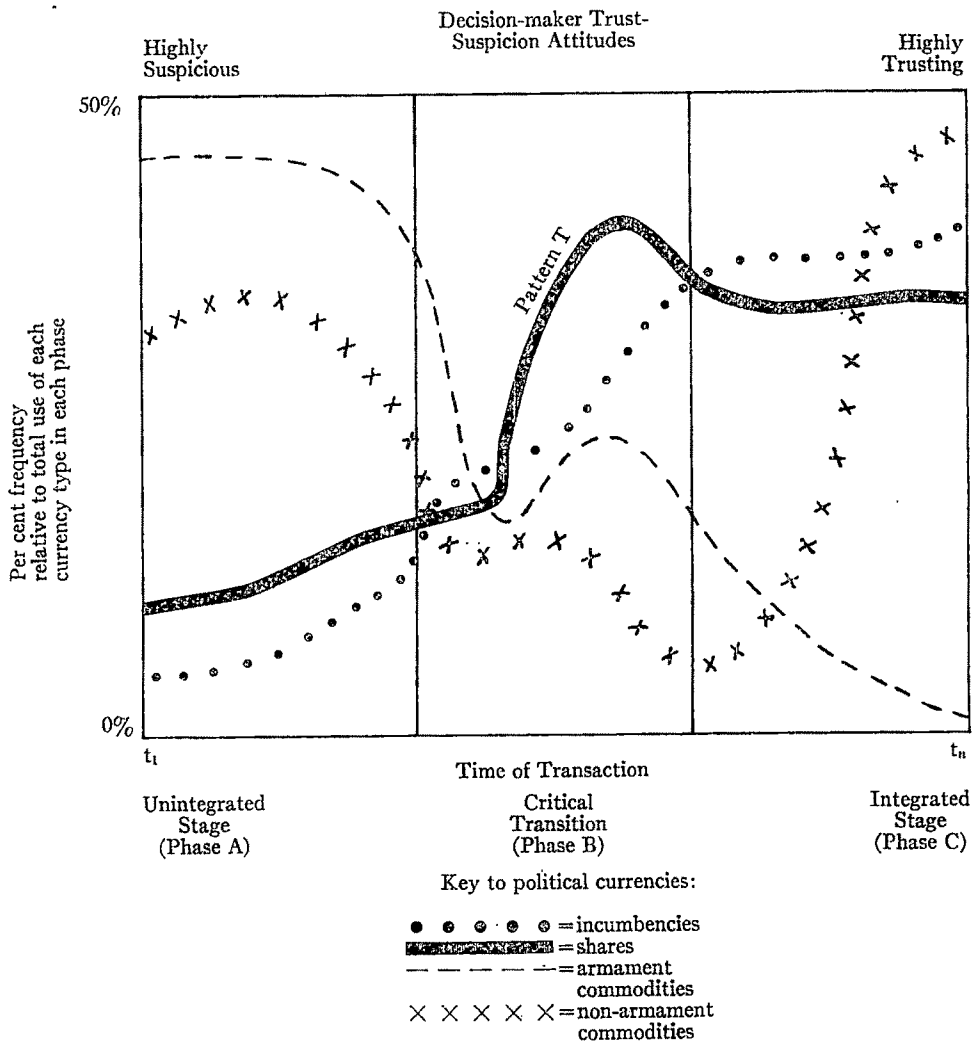

FIGURE 2. Political Currencies Transacted Over Time, Showing Hypothesized Trust-inducing Pattern (Pattern T)

trust-inducing Pattern T (see Figure 2) tend to be associated with successful transitions from unintegrated to integrated stages of political organization.

The transactional time-series that would test the hypothesis are set forth, hypothetically, in Figures 1 and 2.[24]

Briefly, the political currencies transacted during Phase A (Unintegrated Stage) are for the most part armaments. Phase B (Critical Transition) witnesses a rise in armaments transactions, a drop in non-armament commodity transactions (e.g., due to blockades, boycotts, etc.), some increase in incumbency transactions, and *either* Pattern T (sharp rise) *or* Pattern S (decline) in shares transactions. If there is a significant rise in the relative frequency of transactions involving shares currencies (Pattern T), this, hypothetically, will be accompanied by a rise in trusting attitudes and a successful transition to Phase C (Integrated Stage). However, if there is either no rise or a decline in shares transactions (Pattern S), then attitudes of suspicion remain, as in Phase A (as

[24] The mathematical and logical problems of measurement in such a time-series may be considered in the light of the excellent discussion by James S. Coleman, "The Mathematical Study of Change," in Hubert M. Blalock, Jr., and Ann B. Blalock (eds.), *Methodology in Social Research* (New York: McGraw-Hill, 1968), Chap. 11.

the leftward arrow at the end of Pattern S in Figure 1 suggests), and transactional activity returns to the Phase A state.

The theory sketch proposed here requires further formalization, particularly with respect to the operational definition of its principal variables. The predictive statements offered need to be submitted to more rigorous empirical tests than provided in the two cases studies employed for exploratory purposes thus far. Further *ex post facto* historical investigation and simulation experiments seem to hold greatest promise in the design of such tests, and are discussed elsewhere.[25] Either approach has important empirical limitations, yet both types afford challenging opportunities for political scientists wishing to test theoretical generalizations in "the laboratory of history."[26]

If the major hypotheses of this transactional approach are experimentally confirmed, the practical implications may be substantial in a variety of political circumstances, including those involving the design of strategies for advancing international arms control, advancing the political integration of new nations, and even settling violent outbreaks in contemporary urban communities. The strategies would presumably endeavor to promote trust-inducing Pattern T political transactions.

The military capacity to wage war successfully has traditionally been considered an instrument of foreign policy. This view is reflected in Clausewitz's classic definition of war as the continuation of diplomacy by other means. The same view also may be found in most contemporary approaches to "deterrence" of armed aggression through superiority of military forces. Yet, knowledge about the conditions and dynamics of *effective* deterrence continues to be more a matter of conventional wisdom than of validated theory.[27] How "hard" is the political knowledge, after all, that would provide answers to such transactionally stated questions as the following: What are the valuational yardsticks by which particular political transactors judge armament exchanges as "too costly" and transactions in other negotiable political currencies "profitable"? By what series of transactions may adversary decision-makers acquire attitudes of trust sufficient to facilitate arrangements for arms control and political integration? How may changes in valuation yardsticks, political "market-place" arrangements, and political currency denominations raise the probability that world integrating transactions may remain "irrevocable"?

[25] Final Technical Report, ONR Project NR 177258, *op. cit.*

[26] For further pertinent comment, Ole R. Holsti and Robert C. North, "History as a 'Laboratory of Conflict'," in Elton B. McNeil (ed.), *Social Science and Human Conflict* (Englewood Cliffs, N.J.: Prentice-Hall, 1965).

[27] Milton J. Rosenberg, in James N. Rosenau (ed.), *Domestic Sources of Foreign Policy* (New York: Free Press, 1967), for example, attempts to build new ways to reduce distrust between the United States and the Soviet Union from approaches suggested by validated psychological theories. One suggestion is to rely upon systematic "cross-trading," wherein the advantage in one interest conflict is given to one side, while the advantage in another conflict is given to the other side. Thus, adversary leaders may be conditioned away from the view that their relationship is an extended zero-sum game, and attitudes of distrust toward one another may be modified by overt transactional successes.

TOWARD A RATIONAL THEORY OF DECENTRALIZATION: SOME IMPLICATIONS OF A MATHEMATICAL APPROACH

MANFRED KOCHEN
University of Michigan

KARL W. DEUTSCH
Harvard University

This paper seeks to open for exploration the field of decentralization in politics and organizational design. As a first approach, it examines conditions under which decentralization is preferable from the viewpoint of rationality or cost-effectiveness. Our normative statements as to what would be best, or what should be done, are formulated first from the viewpoint of the subjects or clients, but they are expected to include the interest of the community in ensuring adequate service at low cost, and they also include the interest of the rulers, insofar as their power in the long run depends on their capacity to respond to the demands made upon them quickly enough and adequately enough to retain their political support.

The political theory underlying our study assumes that modern governments retain "their just powers by the consent of the governed," and hence that both their legitimacy and their power will depend at least in significant part on their ability to respond adequately to the popular demands made upon them. We do not deal in this study with other important criteria of preference, such as the psychological value which some of those who take the role of powerholders may put upon centralized control, or the contrary value which some of those who identify with their subjects may put upon power sharing and decentralization. We do hope to suggest, however, which side to the centralization-decentralization controversy is likely to be favored by the pressure of cost-effectiveness considerations, and under what conditions.

At this stage, we also assume ethnic, linguistic, cultural and social uniformity, as the conditions most likely to favor centralization. According to traditional theory, at least, strong centralization under non-uniform conditions usually would be more difficult.

We consider a situation where several identical and equally spaced facilities for decision making, information processing, or other operations perform services in response to requests from sources that are uniformly distributed in time and across varying distances. Such distances could be measured in terms of intervening decision points, switching points, waiting lines, or simple geographic space. As the simplest first approximation, we have analyzed this last type—service through communication and/or transport along a long thin spatial strip.

In the simplest models, the focus is on *costs*: the number of duplicated facilities is determined by setting the marginal increase in fixed costs equal to the marginal decrease in the costs of communication and transportation due to decentralization. In later models, the utility of *time* gained by more rapid service in response to requests is taken into account, and attention is given to the more dependable availability of service that comes with decentralization involving duplication of facilities. Throughout all these models the total *volume* of requests, and its ratio to the speed of communication and transport, turn out to be crucial.

As far as they go, the results of the present analysis suggest that the social, political and economic changes, which influence the rising volume of requests, may outweigh in many cases the effects of the technological changes that have speeded up communication and transport, and that societies which adopt the technological changes are likely to be societies that increase also—or even more—the volume of requests for service or responses. Where these conditions apply, current and future social, political and technical developments may increase, rather than decrease, conditions favoring decentralization.

More extended mathematical derivations and discussions are presented elsewhere.[1]

The present paper is the first of a projected series which is to investigate problems of centralization and decentralization by means of a series of models intended to be increasingly close to the actual variables and problems encountered in the practice of governments and other organizations. Problems of uneven distributions of messages or service requests, in space and time, questions of hierarchies among service or decision centers, and questions of lateral communications or interference among multiple facilities among several centers at the same level, will have to be investigated in such later papers.

[1] M. Kochen and K. W. Deutsch, "A Mathematical Model for a Study of Political Decentralization," submitted to *Operations Research*, September 1968.

I. DECENTRALIZATION AS A GENERAL PROBLEM

When the director of a research institute in which there are several independent investigators plans to provide computer-based information services, a choice presents itself. Should he provide each independent investigator with his own small computer? Should he install a large computer system everyone must share? Should he provide some mix of these two extremes?

When an architect plans a low-income housing project on a fixed budget, he faces a somewhat analogous choice. Should he provide one bathroom for each family but no swimming pool plus bathhouse for the project (assuming that the budget does not stretch to cover both) or should he provide 50% fewer bathrooms than families, thus making every two families share one, but providing a swimming pool plus bathhouse for use by all as well?

A university library system may comprise over a dozen branches plus departmental and special libraries. In planning the construction of new buildings and ordering library materials, should the university librarian favor the creation of branches and special libraries wherever they are wanted, supplying each with duplicate copies and each with a separate bibliographic control system? Or should he favor the creation of a central custodial unit where responsibility for bibliographic control is concentrated?

A school system may concentrate most of the effective control in the hands of a single board of education for an entire metropolitan area with several million inhabitants, or it may decentralize much or most of this control down to about three dozen neighborhood school boards, each serving a community of between 100,000 and 200,000 people. Apart from group demands and local power contests, which arrangement would be more rational? In what respects and on what grounds?

To what extent should the commander-in-chief delegate various battlefield responsibilities to local commanders and platoon sergeants? What are the consequences of too much or too little autonomy for the junior managers and foremen of a 100,000-employee industrial organization, as distinct from rigid control by a strong chief executive?

Are the customers of an industry better served by a single firm, or a single decision-making unit within a firm, or by several firms or several decision-making units?

Is the population of a territory best served by a single nation-state or government or a single administrative center within a nation, or by several states, governments, or administrative centers?

All these questions have a common core. It is the concept of the "degree of decentralization" of an organization or institution and its relation to the "performance" of the latter. The performance of every human organization includes crucially its *responses* to information received from its environment. Service organization, such as governmental housing or other public or private service agencies, health services, libraries, or computing centers, often appear passive in that they wait for requests from their potential clients or users, to which they then respond. Other public or private agencies appear more active in that they often initiate a sequence or transaction between themselves and some members of the public. Thus tax collection agencies, draft boards, truant officers, public health departments, and private sales organizations often take some initiative in this sense; and some organizations, such as legislatures, general administrative agencies, and police departments play a mixed role, initiating some transactions and also responding to messages from the outside.

Human organizations of all kinds, however, depend critically on the *feedback* of information from their environment in order to discover the results of their actions and to correct their errors.[2] It is in regard to this exchange of information, and often also of things and persons, with their environment, that the performance of more or less centralized or decentralized organizations is to be compared here, in a series of preliminary steps toward a theory of decentralization.

The approach proposed here would go somewhat deeper, therefore, than the familiar view that centralization is a matter of power—that the strong tend to centralize in their own hands as much power as they can, and concede to the weak only as much decentralization as they must. It is quite true that a powerful person, group or office often can concentrate a great many flows of information and of decision making responsibilities in their own hands, but it does not necessarily follow that they will be able to use this information effectively to produce timely and adequate responses.

The relation between power and communi-

[2] On the concept of feedback, see Norbert Wiener, *The Human Use of Human Beings*, (New York: Avon Books, 1967), ch. 1; K. W. Deutsch, *The Nerves of Government*, (2nd ed.; New York: Free Press, 1966), with references; and Robert A. Rosenthal and Robert S. Weiss, "Problems of Organizational Feedback Processes," in *Social Indicators*, Raymond A. Bauer (ed.), (Cambridge: M.I.T. Press, 1966), pp. 302–340.

cation is thus not a one-way process. Power can command communication, but communication and information-processing capacity may increase power or reduce it to the point of paralysis. Where power originally produced centralization, delays or failures in information-processing or responsiveness may then tend to shift both loyalties and power away from the centralized but unresponsive offices or places of command. The operational effectiveness of centralized or decentralized information-processing or decision-making centers, governmental agencies, business organizations and service facilities, is thus in each case a question intellectually distinct from the question of power, and worth considering in its own right.

Much of the well-known political and social theory on centralization and decentralization implies that centralization is preferable on the grounds of efficiency, and that modern technology, with its jet aircraft and electronic communication, has increased the pressures toward centralization.[3] Some theories also assert, however, that decentralization is better suited to protect the values of democracy, liberty, and popular participation in decision-making.[4] Some theorists point our that these different views balance to some extent, and that the optimal point on some more or less continuous centralization-decentralization scale must be discovered in each case; but they give little further indication as to how these discoveries are to be made.

For a start, we shall try to make explicit a few of the basic notions involved, leaving other aspects of the problem for later work. Thus we shall start from the feedbacks and transactions with the outside world, postponing for later analysis elsewhere the internal decision processes of organizations and their possible overloads which play such a large role in much of current organization theory.[5]

We stress in this paper the concern of the person with primary responsibility for the institutional organization rather than the concerns of the members of that organization. Further, we stress what he *should* be concerned with in terms of purposive rationality, rather than what may actually concern him most for personal, psychological, or sociological reasons. By "what he should be concerned with" we mean norms, related to the basic functions and the survival of the institution for which he is responsible; these norms are determined environmentally in terms of feedback processes that are decisive about the survival of the institution. Not that these neglected subjective aspects are unimportant. Far from it. They may well be the salient features of a viable theory of decentralization. So much more reason to treat them thoroughly, but separately, at a later stage.

There is surprisingly little published literature on which to base a formal explication of the decentralization concept.[6] Some of the

[3] See, e.g., Herbert A. Simon, Donald W. Smithburg, and Victor A. Thompson, *Public Administration* (New York: Knopf, 1956), pp. 272–279. For a related argument in international relations, see Albert Wohlstetter, "Illusions of Distance," *Foreign Affairs*, 46 (January 1968), p. 250.

[4] A qualified emphasis on decentralization is found in Joseph A. Litterer, *The Analysis of Organizations* (New York: John Wiley & Sons, 1965), pp. 378–393; and John M. Pfiffner and Frank P. Sherwood, *Administrative Organizations*, (Englewood Cliffs, N.J.: Prentice-Hall, 1960), pp. 440–462.

[5] For some important general approaches, see Herbert Kaufman, "Organization Theory and Political Theory," this REVIEW, 58 (1964), 5–14, esp. 7–8, 13–14; Mason Haire, *Organization Theory in Industrial Practice* (New York: John Wiley & Sons, Inc., 1962), pp. 6–7; Albert H. Rubenstein and Chadwick J. Haberstroh, *Some Theories of Organization* (Homewood, Illinois: Irwin and Dorsey, 1966).

[6] For examples of discussions of the political and social aspects of decentralization and the size of political units or areas, see Bernard H. Baum, *Decentralization in a Democracy*, (Englewood Cliffs, N.J.: Prentice Hall, 1961); Robert A. Dahl, "The City in the Future of Democracy," this REVIEW, 61 (1967), 953–970; James W. Fesler, *Area and Administration* (University, Ala.: University of Alabama Press, 1942); S. W. Hess, *et. al.*, "Non-Partisan Political Redistricting by Computer," *Operations Research*, 13 (1965), 998–1006; Philip Jacob and James V. Toscano (eds.), *The Integration of Political Communities*, (Philadelphia: Lippincott, 1964); Arthur W. Macmahon, *Delegation and Autonomy* (New York: Asia Publications and Taplinger, 1967); E.A.G. Robinson (ed.), *Economic Consequences of the Size of Nations* (New York: St. Martins Press, 1963). General studies of decentralization are relatively rare in political science. *The Cumulative Index to the American Political Science Review* (1906–1963) (ed.), (Evanston, Ill: Northwestern University Press, 1964) lists only one article for the 57 years covered, S. G. Lowrie's "Centralization versus Decentralization (Federalism)", which appeared in the REVIEW in 1922. During the same 57 years, three articles referring to their titles to the delegation of legislative powers appeared in 1908, 1926, and 1947, respectively.

operations research literature dealing with warehouse allocation problems[7] is relevant, as is some of the applied mathematical statistics literature on problems for determining the optimum number of machines or service facilities.[8] Generally, however, customers are assumed to arrive at the service facility, and the time for requests to pass from the customer's site to the facility and for responses to pass back to the customer is not taken into account. The conventional "warehouse-location" problem is to locate a specified number of warehouses and assign customers to each warehouse so that the sum of the squared distances between each customer and the warehouse closest to him is minimized. Actually, distance may not be best represented by its second power;[9] and the present paper will treat the best number of warehouses not as given but as to be computed. It is primarily in the analysis of information systems that such problems are encountered, and relatively little analytical study has been devoted to these.

In this paper we analyze the simplest of these mathematical problems which are, nonetheless, quite generic to a large class of situations in which centralization vs. decentralization is an issue.

II. MOVING PEOPLE, THINGS AND INFORMATION: THE LOGISTICS OF ORGANIZATION

Decentralization depends in large part on logistics, and all social organizations have problems of logistics. All of them must move messages from one place to another; many of them also must move people, such as field representatives, investigators, fire truck crews, riot squads, case workers or other agents of various kinds; and many must also move material objects, ranging from small samples or mail order items to bulky goods in mass production. Yet some organizations mostly depend in their functioning on the inflow and outflow of messages, as do telephone exchanges, while others depend most critically on the movement of material goods, as do factories. Still other organizations depend primarily on receiving information, such as orders or requests, and on responding to these by moving material objects or people, as do mail order houses and at higher rates of speed also fire departments and ambulance services.

The agencies of government and politics overlap these various types. Public school systems depend upon the movement both of people and of information. The long-run recruitment and maintenance of an army depends upon the movement of persons and supplies, but the short-run intervention of some of its forces may occur in response to an order or message. A law court requires the physical presence of the parties or their representatives, and a prison insists on the physical presence of its inmates. Administrative decisions, on the other hand, often are sent out as control signals or messages in response to information that was received at some earlier stage. Legislation consists from this point of view in a special class of messages issued in response not only to earlier messages but also in response to the physical movement of various spokesmen for interest groups at formal hearings, or more informally of lobbyists, and to the bodily movement of legislators and constituents between their respective constituencies and the capital.

A simple overview of such organizations classified into basic logistic types is shown in Table 1.

* Material objects and/or human bodies

Each entry in any cell in Table 1 refers to either a task to be performed ("medical examination and treatment") or to an institution which performs some task or tasks (e.g., "army," "hospital"). In some cases, such a task is performed only by relatively large institutions, while other tasks can be decentralized in their performance to the level of individual clients. Government and defense usually are concentrated in such larger institutions, but some physicians still visit patients in their homes. Even governments and armies, however, can decentralize their functions to a greater or lesser degree.

For a functional theory of decentralization, toward which the present paper is directed, the social tasks to be performed are more important than the historical institutions which currently happen to perform them. Though institutions have a great deal of persistence and tend to protect their own survival, they nonetheless do change. Some of these changes tend toward greater or lesser decentralization, and a functional analysis of the level of decentralization most appropriate to their chief task is essential in order to evaluate rationally the actual changes which occur in response to technological or political pressures.

We emphasize the distinction between the movement and storage of persons and materials on the one hand, and the transmission and storage of information on the other hand as most important from the viewpoint of logistics. Messages move more quickly by several orders of magnitude than do persons and materials, and unlike persons and materials they can be duplicated at low cost. All information, of course, depends on some material carrier or marker which bears it, much as a book depends on printer's ink and paper, but the ratio of amount of information to mass of carrier, say in bits per pound per hour, is very high and on a computer display terminal (e.g., teletypewriter or display screen), it is still higher. Our analysis will show that transmission speed is often critical for determining the optimum level of decentralization of a network of facilities and we may expect, therefore, to get different answers for systems depending primarily upon transport as against those depending primarily upon communication.

A simple exercise may illustrate these points. Here we idealize a special but prototypical problem to such an extent that we can analyze it mathematically. Our prototype model will deal with the supply of services from one or several storage facilities. This is not irrelevant. For politics and administration, government, administrative agencies, and law courts all can be thought of as storage places for memories, recorded in their files or carried in the minds of their specialized personnel, and as suppliers of decisions to their clients or constituents. The mathematical analysis of this simplified model may give us insights that a purely verbal analysis does not provide. Building on such a more precise and explicit foundation, we hope then to make some progress toward an edifice

of theory that explicates the core problems and proves helpful in explaining the success of various organizations and possibly also in advising decision-makers.

III. A PROTOTYPE MODEL

Imagine an institution existing to supply objects of value, e.g., books or mail-order items, to customers located in an elongated region from Boston to San Francisco in which the north-south dimension is treated as negligible.

Let D be the east-west distance of this region in miles or in terms of relay stations, traffic intersections, intervening opportunities or other conditions affecting the probability and costs of transmission or transport (Definition 1). Let us make the further assumption that the demand for these valuable objects is spread uniformly over the length of this strip. For example, suppose that ten requests per month originate from each mile along the strip.

Let L denote the total load, in requests per month (Definition 2). The total load, L, resulting from this demand requiring service, then would be $L=10D$ requests per month. Assume that we can control the way the institution is organized, and we wish to explore the consequences of various degrees of decentralization.

By the most centralized organization we mean a single service facility, say a warehouse, which maintains a large enough stock of the valuable objects to clear the demand at all times. (At this first stage of the analysis we assume that the time to forward and process requests is negligible.) It is obvious that the best location for this warehouse is in the middle of our stretched-out region, as shown in Figure 1.

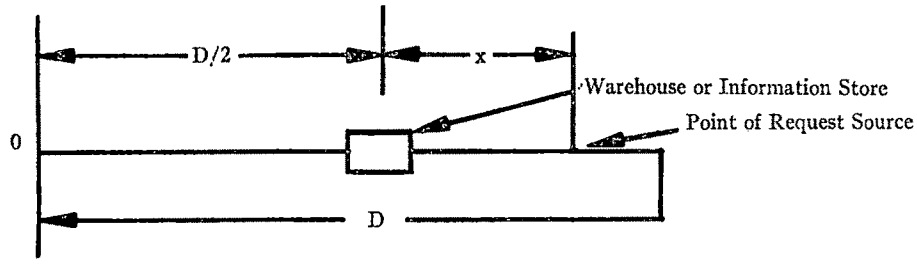

FIG. 1. A Centralized Organization

The manager of the organization is uncertain about the exact distance x between the service facility and the site from which a request (for an object) originates at any moment. When such a request is made, the manager must find the wanted object in the warehouse and transport it to that location.

We assume having a transportation medium which transports at a uniform speed of v miles per hour (Definition 3).

Then the delivery time to a point at a distance of x from the warehouse is x/v. Because the sites of requests are assumed to be uniformly distributed over the length D, the average distance between the site of a randomly selected request and the warehouse at the midpoint is D/4. Hence, the average delivery time for a request is D/4v.

By a slightly less centralized organization we mean two warehouses, with identical inventories (each containing a copy of each valuable object), located at the quarter points of our elongated region (see Figure 2).

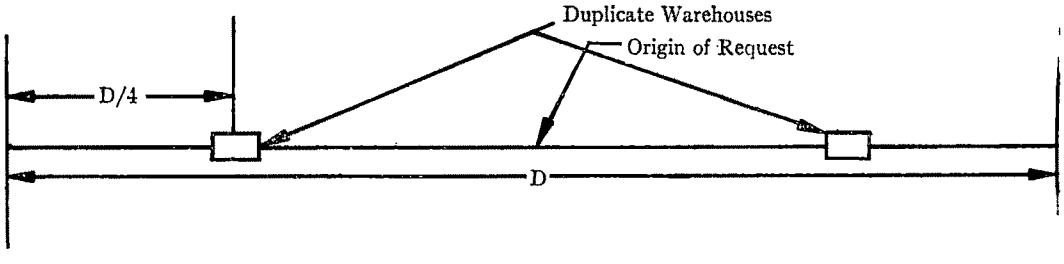

FIG. 2. A Two-Facility Organization

A request originating at any point is serviced by the warehouse nearest to it; requests from points equidistant from two facilities are serviced at random by either.

While for the single facility shown in Figure 1, the delivery time, averaged over many randomly originating requests, was D/4v, it is half of that, or D/8v, for the two facilities shown in Figure 2.

Let the dollar costs of operating a warehouse be \$C per month (Definition 4).

Then the fixed cost of operating the single repository organization of Figure 1 is C (including interest and amortization on its cost of installation) while that of the duplicated service in Figure 1 is 2C.

Let the dollar cost of delivering objects be c dollars per hour (Definition 5).

Then the total demand is L requests per month (with L/2 for each of the two warehouses in the organization of Figure 2), and the average delivery cost is cDL/4v dollars per month for Figure 1 and cDL/8v for Figure 2.

If we used three warehouses, we would arrange them as shown in Figure 3.

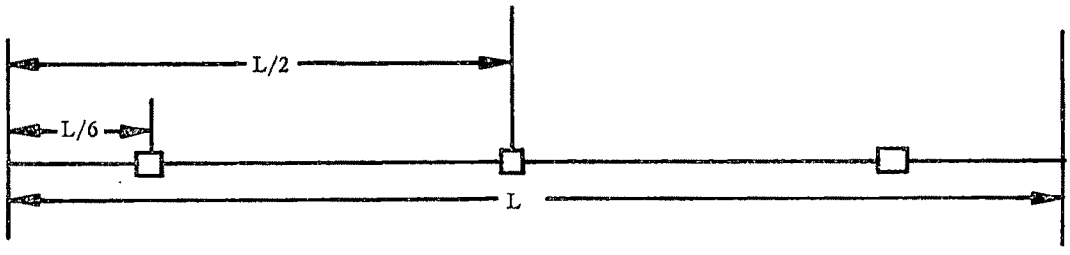

FIG. 3

The most primitive index of decentralization is n, the number of duplicate warehouses (Definition 6).

We would, in the general case, place the left-most warehouse at distance $D/2n$ miles from the left, and space $n-1$ warehouses D/n miles apart, the right-most warehouse being $D/2n$ miles from the right end. Each warehouse meets requests issuing from a distance of D/n or fewer miles to its right or left. Since a request, on the average, should originate $\frac{1}{2}$ $(D/2n)$ miles to the right or left of the warehouse, the average transport distance is $D/4n$. The average delivery time (in hours) is the average distance divided by transport speed (miles per hour) or $D/4vn$.

This first approximation neglects the internal cost of processing and servicing each request within each facility. It also neglects congestion effects and instead assumes *unobstructed* channels of transport and communication. That is, it assumes that the input load L, in requests per unit of time, has no effect on the transmission speed v, and that it has no effect on the throughput rate of the system.

The maximum throughput rate of the system is defined as its capacity, called here M for objects and B for information, respectively (Definition 7).

If the system were partially obstructed, the speed v of transport or transmission would decline with rising input loads; if the system were *overloaded*, its throughput rate would decline with increasing inputs, and it would fall increasingly below the system's capacities M or B. In reality, there often is an extended range of traffic loads L over which the speed v remains substantially unchanged. In the present prototype example, however, we are assuming that this range extends all the way to the maximum capacity point and beyond it, so that v is treated as independent from L at all times. More realistic congestion effects and other complicating possibilities must be left for later treatment.

Suppose time were of no value to users, and only costs mattered to them. Then it would pay to increase the number, n, of facilities until the marginal increase in fixed costs is equal to the marginal decrease in delivery costs.

Let C_n be the cost of operating an organization with n warehouses. Let us assume that $C_n = nC$, namely that it costs simply n times as much to operate an n-warehouse organization as it does to operate a single repository. That is, the marginal increase in fixed costs is $C_n + 1 - C_n$ or just $(n+1-n).C$; that is, it is simply equal to C and remains therefore constant.

We have shown earlier that the average delivery cost per month for a system of n facilities is $cDL/4vn$. An increase by 1 in the number of facilities reduces this cost to $cDL/4v(n+1)$, by a difference of

$$\frac{cDL}{4v}\left(\frac{1}{n}-\frac{1}{n+1}\right)$$

which is

$$\frac{cDL}{4v}\,\frac{1}{n(+1)}.$$

There is a point, therefore, where the savings from lower delivery costs will be just equal to or less than C, the increase in capital costs, and where it will no longer pay to increase n, the number of facilities, any further. We set C equal to

$$\frac{cDL}{4v}\,\frac{1}{n(n+1)}$$

and solve for n. The best number n of decentralized facilities thus would be the integer just larger than:

$$1/2\left(\sqrt{1+\frac{cDL}{Cv}}-1\right) \tag{1}$$

The average service cost per request, S, of this optimal service is given by:

$$s=\frac{nC}{L}+\frac{cD}{4nv} \tag{2}$$

Even these simple formulas have some interesting implications. Let us suppose the following possibilities, as in Table 2:

sensitive over a wide range to proportionate changes in c, D, L, C and v, but is more sensitive to changes in C and v where these values are very small. The table also shows that decentralization may decline as capital costs and/or delivery speeds increase, but that it may increase again at high levels of capital cost and delivery speeds, if the load of service requests and the costs of delivery have risen faster.

This result tends to modify the suggestion of Herbert Simon and his associates, that the introduction of long-distance or intercontinental telephones makes it "unnecessary" for governments "to allow (their) representatives much discretion in the choice of decisional premises." Generally, they stress that "improved methods of communication have made a much greater degree of centralization possible."[10] If we are to judge what is probable or rational, in addition to what is merely possible, we now may consider that a society which produces telephones also produces higher request rates, service demands, and decision loads for public and pri-

TABLE 2. SOME EXAMPLES OF OPTIMAL DECENTRALIZATION LEVELS

	Low Load, Low Delivery Cost		High Load, High Delivery Cost	
	low capital cost, low speed	high capital cost, medium speed	high capital cost, high speed	very high capital cost, very high speed
	A	B	C	D
1. Distance D (miles)	3,000	3,000	3×10^3	3×10^3
2. Load (requests per month) L	3×10^4	3×10^4	3×10^6	3×10^6
3. Costs of delivery c ($ per hour)	0.10	0.10	10.–	10.–
4. Capital cost C ($ per month)	10^2	10^4	10^4	10^5
5. Velocity of transport v (miles per hour)	10	10^2	10^3	10^4
cDL	9×10^6	9×10^8	9×10^{10}	9×10^{10}
Hence Cv	10^3	10^6	10^7	10^9
Then optimum number of facilities N	47	1	47	5
Distance among facilities	64	—	64	600
Cost of service, S, in dollars per request	.32	1.08	.32	.32

This simple exercise demonstrates—as does, of course, the formula

$$\frac{1}{2}\left(\sqrt{1+\frac{cDL}{Cv}}-1\right)$$

given earlier—that this simple model is equally

[10] Simon, Smithburg, & Thompson, *op. cit.*, pp. 275, 279. Simon's thoughtful comments on the various tendencies making for actual, rather than merely possible, centralization are wholly compatible with our analysis. The latter merely adds some emphasis on several no less real tendencies which may work in the opposite direction.

vate agencies, and that they may become more affluent in regard to capital costs, so that the optimum degree of decentralized facilities may increase.

The optimum level of decentralization emerges as a systems property in response to changes, not in one parameter, but in the configuration of several critical parameters. Such a configuration may favor the excellent telephone service and considerable political decentralization of present-day Switzerland rather than the slow messenger service and the much greater political centralization of ancient Egypt or Tokugawa Japan.[11] Even under the simplified assumptions of our prototype model, growth of the capitalization and performance of service organizations of all kinds, including governments, may rationally lead to decentralization or to centralization, depending on which of the relevant parameters grow at a greater rate.

IV. TRANSPORTATION VS. TRANSMISSION: THE BULK OF OBJECTS AND THE LENGTH OF MESSAGES

Whether or not to service requests with a centralized or decentralized deployment of facilities depends to some extent on what is being requested: materials or information. Both are transmitted through channels in which they would move at characteristic primary speeds if the channels were unobstructed. In each case, however, these channels have limited capacities. They can, and usually do, become overloaded and obstructed with a resulting decline in the effective rate of flow. Thus, congested roads may cut the effective speed of traffic flow from 60 to 15 miles per hour; congested airports may cut the effective speed of downtown-to-downtown jet air travel from 600 miles per hour to 300 miles per hour for airport-to-airport speed and 100 m.p.h. for downtown-to-downtown speeds. Similarly, overloaded switchboards and relays reduce the effective speed of electronic transmission from the theoretical limit of the speed of light (186,000 miles per second, or over .67 billion miles per hour, making light from the sun take about nine minutes to reach the earth) to an average effective speed varying from 1,000 to 10,000 miles per hour. Even when delayed in this manner, however, electronically-optically transmitted information will tend to move on the average about 100 times as fast as would bulky material objects. Communication thus differs from transport by several orders of magnitude in regard to the degree of centralization or decentralization which it makes relatively optimal.

At this point it becomes desirable to consider the bulk or weight of objects, measured in pounds or tons, and the length of messages, measured in bits of information. (Actually, we shall be more concerned here with orders of magnitude than with precise measurements.) The cost variable previously introduced measured the cost of "delivering an object" in response to a request, in dollars per hour. But c depends not only on the speed but on the nature of the object as well. It costs more to deliver a massive object than a light one. It costs more to deliver a voluminous message that requires wider and costlier communication channels than to deliver a brief message.

As to the average volume of transmission per request, we shall call it m for material objects and measure it in pounds or tons; and we shall call it b when referring to the transmission of information, which is measured conventionally in "bits." (A bit is a single yes-or-no decision, such as the on-or-off position of a switch, or a dot or dash in the Morse code, or a black or white point on a television screen. A single digit number corresponds to about four bits, a teletype letter six bits, an average English word about thirty bits, a printed page in a book about 10,000 bits, a 300-page book three megabits, i.e., three million bits, and over twenty megabits for one second's picture on a normal television screen.) The capacity of a transportation channel then is the amount of mass M it can move times the velocity v (i.e., distance/time) at which it can do so under the best traffic conditions. The formula for this is Mv for the overall capacity of the channel and mv for its effective capacity in regard to the size and speed of transmitting and/or servicing the average request. Both Mv and mv are formally analogous to the concept of momentum in mechanics. As it takes force to change momentum in mechanics, so it takes innovation—in the form of visible investment in capital equipment and/or invisible investment in new technology—to change capacity in a

[11] On centralization and communication at earlier levels of technology, Lewis Mumford comments: "Action at a distance, through scribes and swift messengers, was one of the identifying marks of the new megamachine (the centralized state) . . . 'The scribe, he directeth every work that is in this land,' an Egyptian New Kingdom composition tells us . . . They made possible the constant 'report to political headquarters' essential for a centralized organization": *The Myth of the Machine* (New York: Harcourt Brace, 1967), p. 192. Cf. also Harold A. Innis, *Empire and Communication*, (Oxford: Oxford University Press, 1950).

transport channel (e.g., to a supersonic transport aircraft). The change in capacity Mv is then a possible measure of the effect (or "force") of innovation in respect to the overall capacity of a channel, and the change in mv similarly would measure its effect in regard to the servicing of average sized requests.

Decentralization often depends critically on the effective service capacities of the available transport and communication channels, and changes in the optimum level of decentralization for a given organization, government or service.

The following table may clarify some of the relations between capacities, rates and the different conditions examined so far.

munication, though, of course, the cost differs. These channels differ mainly in their capacity, in how many bits, or bv, similar to v per second of information, mv for materials. In the communication processes, therefore, the number of duplicated facilities does not depend very much on geography with respect to saving message delivery time. The distribution of overall channel capacities, B (bits per second), and data transmission rates B', in place of bv (i.e., message speed times message length), plays a much more central role in this regard. A low value of B is about 2,000 bits per second for voice-grade telephone lines, and a high value about 200,000 bits per second for wireless transmission, such as radio telephony or tele-

TABLE 3. SUMMARY OF KEY VARIABLES

3a. Basic Variables

D = length of strip, in miles, typically 3,000 for a big country, 300 for little one

L = total load, in requests per month, about 30,000 for heavy demand, 3,000 for low demand

C = fixed cost for one facility, in dollars per month, about 10,000 for an expensive facility and 100 for a cheap one

v = average transport speed under actual traffic conditions, in miles per hour, about 1,000 for jet speeds and 10 to 100 for ground passenger speeds

m = mass or bulk of items to be transported in response to requests, in pounds, about 100 for massive objects to 1 for light ones

b = amount of information in an average message delivered in response to a request, in bits, from 10 megabits for a second's worth of TV to 10,000 for a printed page's worth

B' = rates of information transmission under channel conditions, in bits/second, from 10^7 for video to 2,000 for digital telephone

3b. Parameters	*Unit Transport Cost*	*Average Cost To Service Request*	*Assumption*
Simplest Model ($m=0$)	c_v, dollars per hour, for transport at a speed-capacity of v miles per hour	$c_v \cdot \frac{D}{4nv}$	$v=V$
Bulk Taken Into Account	c_{MV}', dollars per pound per hour, for transport characterized by speed-bulk capacity of MV pound-miles per hour	$c_{MV}' \cdot m \frac{D}{4nv}$	$mv=MV$
Digital	c_B'', dollars per mile per hour, for communication characterized by a capacity of B bits per second	$c_B'' \frac{D}{4n} \frac{1}{3600} \frac{b}{B'}$	$B'=B$

Actual rather than maximum transmission speeds, however, are very nearly the same for a person-to-person call over a distance of thirty miles than over a distance of 3,000 miles and what really counts is not the velocity in miles per hour but the capacity in bits per second. The value of v for telephone, telegraph, wireless via radio or television, etc., is substantially the same for local as for long-distance com-

graphy, and at least one hundred times this amount for television.

These considerations permit us to make our notion of current transport costs somewhat more realistic. Let us begin with the case of bulk movements, such as mail, freight, or personnel. We have previously considered c, or more precisely, c_V, as the transport cost in dollars per hour depending only on speed

capacity, but regardless of the bulk to be moved. Now let us consider, instead, $c'MV$ as the transport cost in dollars per pound transported per hour for a carrier with capacity MV. Here it costs more to move the same bulk of freight more quickly, as airmail and airfreight cost more than do slower services, but it also still costs more to move a larger number of pounds at unchanged speeds. The average transport cost per request is simply $c'MV$ times m times D/v. The optimal number of facilities can therefore be calculated with these refined assumptions by the formula:

$$\frac{1}{2}\left(\sqrt{1+\frac{c'_{MV}DLm}{Cv}}-1\right) \qquad (3)$$

The average cost of service S' per request of average shipment weight m then becomes:

$$S' = \frac{nC}{L} + \frac{c'Dm}{4nv} \qquad (4)$$

and the total cost of service $S'' = S'L$ (Formula 4a).

In order to take into account in these formulas the weight of the average shipment, we had to replace c/C by c'/C and D/v by mD/v, while the total load of requests, L, has remained unchanged. If $c'_{MV} = m$, the cost of transporting the shipments of average weight m, equals c_V, the average transport cost of filling a request, then the weight of the average shipment would make no difference for the optimum level of decentralization, and the results of Table 2 would remain unchanged. If, however, an increase in the average weight of shipment would bring about an increase in the transport cost, then the optimum number of facilities would increase, in proportion to the square root of the change: a 100-fold increase in average shipment weight (and cost) would then require approximately a 10-fold increase in the most efficient number of facilities.

Let us assume that an administrative agency has to consult a file on each case on which it has to make a decision. Servicing a case would then require either transporting, on the average, one pound of documents from the repository to the site of the request, or else transmitting the information in those documents over a long distance computer channel. The file to be transmitted is assumed to contain the equivalent of a 200-page book, that is, about 4 million bits, or 4 megabits.[12] According to formula (3), the optimal number of facilities for electronic transmission under the above assumptions is now sixteen. This is more than three times as many as in the earlier case presented in column D of Table 2, where the transmission costs depended only on speeds and not on the amount of information being transmitted to service the average request.

Had we sent our four megabits by express messenger service at the rate of $c' = \$.04$ per pound-hour, then the optimal number of facilities, according to formula (2), would be three. In other words, *under the assumptions of our example, a slower service based on messengers or mail delivery could be much more highly centralized than a fast service based on a computer-based or satellite-based communication net.*

It might be interesting to compare the total costs for these two kinds of service. Let us recall that each of them would have to cope with 3 million requests per month, each request requiring transmission of four megabits. The cost of servicing requests by digital telephone—called "dataphone"—transmission would be $1.05 per request, compared with $.20 per request for service by mail or express messenger. *The five-fold increase in cost,* however, *here would buy a sixty-fold increase in speed.* The dataphone replies would be available within little more than half an hour, in contrast to the thirty hours response time required for the more highly centralized service based on messengers or mail.

The situation is similar in some respects to the transmission of messages through communication channels. Here c_B'' is the cost of transmission for a channel with a capacity (maximum rate) of B bits per second, in dollars per hour per mile. The average cost of servicing a request would then be $c_B''/3600 \cdot b/B \cdot D/4n$, because $D/4n$ is the average distance from a request to its nearest service facility when there are n such facilities. The actual cost of telephone transmission does not increase in *direct* proportion to distance; it increases by less for large distances than it does for small distances, but this will be neglected for the purpose of this paper. The cost c_B'' for long distance telephone is about $.02 per mile per hour for ordinary long-distance transmission. (This would amount to $3.00 for a three-minute business-hour call from Boston to San Francisco and $1.00 for a similar Boston-

[12] This calculation assumes roughly the usual average of 6 bits per character, 80 characters per line, and 42 lines per page. For further discussion, see Manfred Kochen (ed.), *The Growth of Knowledge* (New York: John Wiley & Sons, Inc., 1967); also Manfred Kochen, "Newer Techniques for Processing Bibliographic Information," in F. Kilgour (ed.), *Proceedings of the Symposium on Data Processing in University Libraries* (Philadelphia: Drexel Institute of Technology, 1968).

Chicago call.) Such a channel is characterized by a capacity of $B=2000$ bits per second.

The formula for computing the optimal number of facilities in this case is therefore

$$\frac{1}{2}\left(\sqrt{1+\frac{c_B''}{C}\cdot\frac{1}{3600}\cdot\frac{b}{B}\cdot D\cdot L}-1\right). \quad (5)$$

Note that we have replaced c/C and D/v in formula (1), or c'/C and Dm/v in formula (2) by c_B''/C and $1/3600\cdot b/B$ respectively.

V. THE VALUE OF TIME: A FIRST APPROACH THROUGH OPTIMIZATION

In the primitive model treated so far, no value was assigned to time. Users were assumed not to care how long they had to wait for service. In fact, however, users find service with smaller delivery time more valuable than service with high delivery time. Similarly, clients or constituents of a governmental agency often request decisions which are to be acceptable to them in substance but which are valued more highly if they are prompt in time. In some other studies, the probability that a government, or a governmental agency, will produce within an acceptable time an acceptable response to the average demand upon it has been called the *responsiveness* of that agency.[13] Responsiveness and mean response time thus may be included among the highly relevant performance indicators of governments and their agencies. This section of our inquiry will attempt to make explicit some possible relationships between response time, the utility of time to the average user, and the degree of decentralization.

As a first step, let us assume a single "representative user" with the properties of both the average and the median users of the service, who are assumed to be identical. (We assume at this point uniform distribution of locations and utilities for all users.)

The net worth, W, of the institution is its utility to the user minus the cost to operate it. Figure 4 shows a possible relation between utility and communication speed, compared with approximate current rates for sending a brief message across 1000 miles in the United States.

It is difficult to infer even very roughly the shape of the demand curve of the American people for speed of transmission of their messages. It is illuminating, however, to plot the rates for the transmission of messages by telephone, telegraph, and mail (air and regular). All these rates have been set by complex processes. These are at least partially responsive to the political demand generated by the population in their roles as interest groups and citizens. Since these rates have remained relatively stable and have not aroused intense opposition, they can serve as indicators of acceptability. Fitting a curve to these data suggests a monotonically decreasing function of rate versus delivery time such as shown in this figure.

Let us first consider the case of a society which can afford to back up its utilities completely with actual purchasing power representing all the required resources. Such a society might then consider increasing the number of decentralized facilities n so long as this increases the net worth to the society. It would stop increasing only when the marginal increase in net worth with n duplicated centers is zero. This enables us to derive a formula for n, which depends on the utility of time. The higher the utility of time, the more we shall be willing to pay for higher speeds of response or of service.

The utility of time will be large in a society that has urgent needs to save time or that puts great cultural value on speed (which some critics of contemporary Western culture might call impatience), or whose members have many attractive alternative opportunities for occupying, so that the opportunity cost of time to them is raised sometimes to an oppressive degree.[14] Our R may reflect a combination of all these pressures. The same cultural factors of urgency and impatience would be reflected to an even greater extent in the shape of a curve describing the variation of utility with response time. The greater the society's concern with speed, the steeper the curve will be.

In the case just presented, the optimal degree of decentralization would be to make n as large as possible if the value of time is larger than the increase in total cost. If the opposite condition

[13] On the concept of responsiveness, see K. W. Deutsch, S. A. Burrell, *et. al.*, *Political Community and the North Atlantic Area*, (Princeton: Princeton University Press, 1957, 1968), pp. 40–41, 199–200; Bruce M. Russett, *Community and Contention: Britain and America in the Twentieth Century*, (Cambridge: M.I.T. Press, 1963), pp. 29–30; Dean Y. Pruitt, "Definition of the Situation as a Determinant of International Action," in Herbert C. Kelman (ed.), *International Behavior: A Social-Psychological Analysis* (New York: Holt, Rinehart and Winston, 1965), pp. 397–399.

[14] On the general problem of the "quality of life," which is connected with our growing lack of and need for time, compare John Kenneth Galbraith, *The Affluent Society* (New York: Houghton-Mifflin, 1958) and *The New Industrial State* (New York: Houghton-Mifflin, 1967).

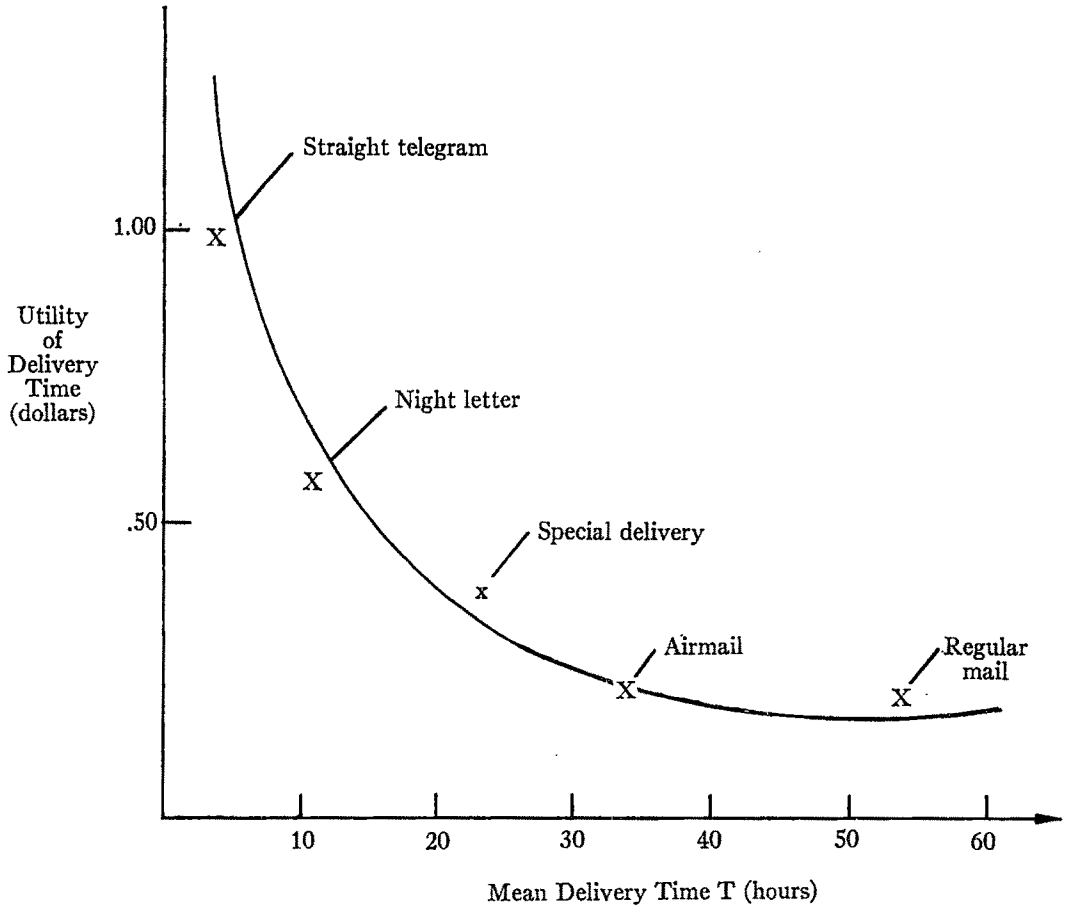

FIGURE 4

holds and increases in the speed of response on service are valued less highly than the increases in cost resulting from increases in decentralization, then the optimum number for n is 1; that is, complete centralization. A society as rich and as pressed for time, therefore, as we assumed it to be in this example would tend to go to one extreme or the other: complete centralization or decentralization. The tendencies toward substituting in many parts of the United States individual transportation by personal automobile instead of public transportation may resemble in some ways the second of these trends—up to the point, at least, where mutual interference among automobiles on congested streets and highways becomes critical.

MORE REFINED MODELS: REDUNDANCY AND FLUCTUATIONS IN DEMAND

Using multiple facilities for more dependable service. In the models analyzed so far, we assumed that if there are n duplicated facilities any one of which could have serviced all the L requests per month, then each facility is used only $1/n$th of the time. Each is to some degree redundant, therefore, for each now services only L/n requests per month. For a decentralized organization, with large n, the utilization percentage is quite low and redundancy is high. If low response time has very high utility —i.e., the value of R is high—and transmission costs are high but fixed costs are not too high, then such low utilization is tolerable. The unused portion of the time, however, has considerable potential value in:

(a) insurance against the effects of breakdown;
(b) smoothing losses due to fluctuating demands and busy local facilities;
(c) control of errors.

Clearly this average delivery time increases with the probability of breakdown in one parti-

cular facility, but in proportion to n. As we decentralize, we gain more side benefits in reduced mean time loss due to failure. The greater the transmission speed v, the greater the effect of this time saving. Technical progress may confront designers with a choice between increasing the speed or the reliability of their equipment. Decentralization and redundancy, at higher cost but at the same level of technology, may permit them to have both.

Total response time and fluctuations in demand. Instead of mean delivery time $\overline{T}_n$, it would be more realistic to consider the total response time Q_n. This is the total time lapse between the epoch the request originates and the epoch the information or item requested is received by the requestor at the site where it originated. It is this turn-around time which matters to the originator of a request. This is the sum of three terms:

$$Q_n = F_n + S_n + T_n \tag{6}$$

Here F_n is the time to transmit and forward the request from its source to the nearest station able to service it.

It is the run-around time, which the customer does not notice, apart from the turn-around time.

Next, we let Sn be the time it takes to service the request at that station, including the time at the other stations which had to decide whether to pass it on and to do so.

Finally, T_n is the time to transmit or transport the results back to the source, as defined before.

Since we can calculate $\overline{T}_n$, we can do likewise for $\overline{F}_n$ and $\overline{S}_n$. The latter term, the internal service time S_n, includes the time needed for decision-making and the possible delays resulting from the overloading of the decision-making and the possible delays resulting from the overloading of the decision-making capabilities of the service organization or bureaucratic agency. This aspect of the problem has received a good deal of attention in the literature of organization theory and management science.[15]

If the total demand is L' requests per hour, then each of n stations has to service L'/n requests per hour under the assumption of uniformity over length D of the strip. If we assume 10×30 or 300 hours per month, then $L = 300\ L'$ where L is the load in requests per month, as previously defined. If one service could handle the total demand, its service time must be $S=1/L'$ hours per request. Thus n replicated facilities offering this service could handle n times this total demand or each be utilized only a fraction $1/n$ of the time. On the other hand, slower services, with service time $S_n=n/L'$, could be used to handle the same demand, and these would be utilized one-hundred-per-cent.

Of course, the cost of such a slower service with service time n/L' hours per request should not be C, the cost of a service with $S=1/L'$ hours per request; it should be lower. Since many identical such services are required, their fixed cost C_n might be lowered still further, at least in regard to those components that could be produced in quantity.

If the demand is not constant in time, but fluctuates randomly, and if the capacity of each facility is only equal to the average demand, then there will be times when a request cannot be serviced by the nearest server because it is busy. In that event, the request is forwarded according to the same pattern used for routing when the nearest server was down. If the request has to be rerouted several times, $\overline{F}_n$ becomes a "run-around time," comparable to the possibly longer or shorter waiting time in a queue or single centralized facility. In either case, the effective waiting time may exceed the waiting capacity or tolerance of the client, as in the case of emergency patients for hospitals, or of emergency responses in military or police systems, or in urgent local or national political decisions.

The formulas and calculations involved even in this simplified model would permit us to derive conditions on R and optimal n in many additional pages of more complex mathematics. For this reason, as well as for reason of the greater flexibility in modeling more realistic systems, it seems desirable for future work to obtain these quantities by computer, either by evaluating complex formulas or by Monte-Carlo simulation.

In this more realistic and complex analysis, we suppose that the service time, s, per server varies with the percentage u "he" is utilized. That is, u is the percentage of time a facility is utilized.

If u is small, $s(u)$ is high. He is slow because he is out of practice, because start-up time causes delays, etc. If u is close to 100%, $s(u)$ is also high. He is slow again, this time because he is overloaded. Some services don't get done at all if the server is too overloaded, and this may be far more costly than under-utilizing him; this is especially true when the value of the service is high, as in cases where the server is a highly paid executive. For intermediate values of u, $s(u)$ is moderate. A curve like $s(u)=s_0$

[15] See references in notes 2–6, above.

$(u-u_0)^2+s_{00}$ might represent the general shape of the curve.

VII. SOME IMPLICATIONS FOR ORGANIZATION THEORY AND POLITICS: SOME SECULAR CHANGES IN KEY VARIABLES

Our crude models suggested that a greater number of multiple service facilities, n, and hence a higher degree of decentralization, becomes rational with an increase in the load or volume of services demanded. Also, a higher degree of decentralization becomes desirable with an increase in the value of time, and in those portions of service costs which are related to time and/or distance.

Our models further suggested that this optimal degree of decentralization increases with a decrease in the proportion of the fixed capital costs of the service among its total costs; and they suggest that the optimum degree of decentralization also increases with any decrease in the margins of error and of breakdown that are considered acceptable in the performance of the service.

All these decentralization-promoting conditions will tend to increase with economic growth and technological development. Let us first consider changes in direct costs. If other things remain equal, then the optimal number of decentralized facilities for a service increases in proportion to the square root of the ratio of its time-distance costs c to its capital costs C. Secular trends toward highly advanced levels of economic and technological development make human labor more expensive, and they make capital goods relatively cheaper. Thus they may tend to increase this ratio, and hence the desirable degree of decentralization. Some economic data suggest that this may have happened, both in Communist and non-Communist countries. An increase in real wages normally represents an increase in the price of labor relative to the price of goods, including capital goods, and hence also an increase in the c/C ratio. In many advanced countries of the world during recent decades, real wages have tended to grow on the average at about three per cent per year, thus doubling every twenty-three years. If real wages should grow fourfold in the course of a half-century, while capital costs would not, then at the end of such a period the optimal number of decentralized facilities for a wide variety of services may well have as much as doubled during the same time. If capital costs should grow somewhat but less than real wages, there would still be a net tendency toward some decentralization, albeit to a lesser extent.

Demographic, economic and technological growth in many countries in recent decades, very roughly speaking, has proceeded at annual rates of about 2 per cent and 3 per cent, respectively, adding up to about annual 5 per cent increase in the demands for many services, and doubling about every 14 years the load upon many of the public or private centers that have to supply them. Such increases in loads include the volume of demands for many political, administrative, judicial and quasi-judicial decisions and responses, as well as for many services and for the communication and transportation they imply.[16] Moreover, as

[16] In the 1950s, the average rate of per capita income growth in 68 countries, comprising 86 per cent of the world's population, was about 3 per cent, while the average rate of population growth in 111 countries, with 97 per cent of mankind was 2.3 per cent. (B. M. Russett, *et. al.*, *World Handbook of Political and Social Indicators*, New Haven: Yale University Press, 1964, pp. 46–48, 160–161.) More recently, in 1960–66, world population increased at an annual rate of 1.9 per cent. During the last two decades, total GNP in many countries may have been rising, therefore, at about 5 per cent per year, and thus doubling every 14 years. Request loads and service loads in many fields, including governments may have grown at about the same rate as GNP. *United Nations Demographic Yearbook*, 1966 (New York: 1967), p. 95. During the same years, 1960–66, the population of the United States increased at the rate of 1.4 per cent, while its gross national product in constant 1958 prices grew at 4.8 per cent. Murders and non-negligent homicides grew at 2.3 per cent, all accidents at 2.8 per cent, domestic mail at 3.5 per cent, and daily telephone conversations at 5.0 per cent, and automobile thefts at about 7 per cent. In contrast to this, the average speed of motor vehicles increased only at 1.4 per cent a year, and about the same low rate held for the 1945–66 period. The average speed of aircraft on scheduled domestic air carrier routes increased at about 3.5 per cent for 1950–67 period, but rose more quickly, at 5.0 per cent, during the years 1960–67, and the speed of aircraft on international flights in 1960–67 increased at about 7 per cent per year. (Approximate rates, computed from data in the *Statistical Abstract of the United States 1967*, pp. 58, 86, 505, 508–509, 561 and 586; and *ibid.*, 1968, pp. 6, 550 and 573; and *Uniform Crime Reports for the United States*, 1960, p. 2, and *ibid.*, 1965, p. 3.) These figures exclude, however, the delays caused by getting to and from the airports, and the delays by traffic congestion on the ground, and in the air above many airports. If these delays are taken into account, it seems plausible that many activities,

technological progress speeds up transport and communication, it increases the opportunity cost of time, since more things now could be done or experienced in each unit of time than had been the case earlier. Finally, highly modernized and automated technologies may require higher levels of accuracy and reliability of service. Thus they may need more redundancy of facilities as an insurance against error and breakdown.

Perhaps most importantly, the growing need for greater precision and adaptability of responses to the increasingly complex, diverse and changing needs of people will require in many cases more frequent dialogs and feedback cycles of back-and-forth communication between service centers and customers, agencies and clients, administrators and constituents, the rulers and the ruled. This will multiply the effective distance D (regardless of whether it is measured in rules, switching points, or intervening obstacles or opportunities); it will multiply it by the average number of feedback cycles of communication, travel or transport required to ensure an acceptable fit between each specific demand and the particular response to it. The current demands for more popular participation, initiative and communication "from below," if heeded, would have similar effects: it would increase the average number of feedback cycles needed, and hence often the importance of distance and proximity. Each of these changes makes for an increase in the degree of desirable decentralization.

Under the assumptions of our models it seems quite possible, therefore, that many of the highly modernized and automated societies and nations which we may find by the end of this century will by then require a much greater degree of decentralization in public and private services than the one to which we are accustomed now. Doubtless some of these assumptions will have to be replaced by more realistic ones. In particular, refining our simple concept of decentralization, introducing the notion of hierarchies of facilities, and revising the assumption of uniform distribution of demand in space and time, all may well modify some of our findings. The present paper already may suggest, however, that the naive images of a future of ever increasing centralization in business organizations, public services, national governments, and the international political systems may have to be revised.

---

calling for public service, now may be growing faster than does our effective speed in moving persons and goods in daily practice. Something similar may apply to telephone communications: a telephone call from Washington to San Francisco during business hours does not get through much more quickly to the individual we want to reach in a busy office than it did in 1945.

THE DEVELOPMENT OF POLITICAL IDEOLOGY: A FRAMEWORK FOR THE ANALYSIS OF POLITICAL SOCIALIZATION*

RICHARD M. MERELMAN
University of Wisconsin

"Myself, I get confused. The President tells ya that he don't want no war, it's peace. You pick up a paper, they're bombing children. And television, the guys being interviewed, talking about peace, and the picture shows where the women and children are being bombed and slaughtered and murdered. How long if I think that way and I have had a bad feeling, how long will other people that their mentality's not strong enough, to separate the cause of it? Fear. What's gonna happen to our kids, our grandchildren?

"Lotta them are afraid of their jobs, losing their jobs. Because the government's maybe got some contract with some company. For example, we got one fellow here works with the government, with this here carbonic gas or whatever it is. If he opens his mouth up too much, he can lose his job. And the senators or congressmen, they personally don't take interest in their own country, right here, what's going on.

"The colored. We had a tavern on 61st and State, three and a half years, Negro neighborhood. I tell you I never was insulted no place by not a Negro person over there. They respected me highly. It took a white fella to come in and insult me because I wouldn't serve him beer, he was too drunk. And if it wasn't for these poor Negro fellas, I'd a probably killed this man. (Laughs) Because he called me a dirty name."

Eva Barnes, 56, citizen of Chicago.[1]

I. FOUR THEORIES ABOUT THE SOURCES OF IDEOLOGY

Mrs. Barnes is trying to understand the political world, but she suffers from a common problem. She has no intellectual handle on it. She blames the government for acting inconsistently, but she herself is inconsistent. She deplores war and its slaughter; yet she can imagine herself killing a man who has merely called her "a dirty name." She rambles from war to governmental control of employment to the problem of race. There are no explicit intellectual links in this chain. Rather, her choice of topics seems almost randomly martialed. For example, "them" in the first sentence of the second paragraph has no clear referent; therefore, we have no way of knowing the logic that led her from war to the involvement of government in employment. And, of course, she speaks primarily from and about personal experiences, which she uses to illustrate her generalizations. There is the "fellow . . . (who) works with the government," and the incident in the barroom. Each single case must support by itself the general principle. Finally, her remarks include no familiar political concepts by which we can connect one observation to the next. We can understand why Mrs. Barnes yearns for "the cause of it."

Is Mrs. Barnes atypical? Yes, but in an unexpected way. She has been a political activist. She helped unionize the Chicago stockyards under conditions which might well have made her reflective about her political world.[2] The vast majority of her fellow citizens have never done anything as political as union organizing. Consequently, their conversations about politics might be even more fragmented than hers.

Although Mrs. Barnes' discussion of politics evidences a desire to understand, it is uninformed by any basic ideational framework which would permit comprehension. This framework may be called ideology. It is by now a commonplace that the mass of Americans do not have a sophisticated conceptual organization by which politics may be understood. Perhaps the aptest description of this situation is contained in Philip E. Converse's "The Nature of Belief Systems in Mass Publics."[3] Converse defines political ideologies as belief systems characterized by high constraint, great range, and a centrality of political items.[4] These belief systems provide conceptual and terminological canals into which the flood of political events which overwhelms Mrs. Barnes can be diverted and managed.

Political scientists have emphasized different components of ideology. The concept of con-

*I wish to thank Fred Greenstein for his comments on an earlier version of this piece. He is absolved of any responsibility for what follows.

[2] *Ibid.*, pp. 61–62.

[3] In *Ideology and Discontent*, ed., David E. Apter (New York: The Free Press of Glencoe, 1964), pp. 206–262. For an interesting attempt to rebut Converse, see Norman R. Luttberg, "The Structure of Beliefs among Leaders and the Public," *Public Opinion Quarterly*, 32 (Fall, 1968), 398–410.

[4] Converse, *loc. cit.*, pp. 207–213.

straint is vital to Converse's analysis. Constraint "may be taken to mean the success we would have in predicting, given initial knowledge that an individual holds a specified attitude, that he holds certain further ideas and attitudes."[5] But ideologies also provide standards by which political events may be evaluated, allowing a person to approve some and deplore others. While Converse's discussion of ideology stresses cognition, Lane's definition of ideology emphasizes evaluation. To Lane, ideologies "are normative, ethical, moral in tone and content."[6]

My understanding of ideology encompasses both panels of this picture. Let us think of ideology as involving: 1) a considerable number of constrained political ideas. By "constraint" let us mean, with Converse, that if one idea changes, those others related to it in the ideology will change as well. 2) An evaluational and prescriptive system. The ideology sets forth a statement of political preferences. 3) Persistence. An ideology must have some arbitrary, but considerable, duration in order for us to distinguish its components from passing whims. 4) Global standards. The judgments applied to any sub-category of political events within the ideology are exhaustive and consistent. 5) Boundaries. Political events which fall into different sub-categories within the ideology are sharply distinguished from each other and are, therefore, judged differently by and within the ideology. 6) Deductive consistency. Given inherently non-logical premises, deductions must occur in accordance with the rules of logic. For example, if a person, because of some views of individual morality, favors a balanced budget, he cannot, at the same time, believe in extra-budgetary social welfare payments to his own group. In short, ideological prescriptions must not produce logical absurdities. 7) Activist directives. Political ideologies do not produce apathy.

According to Converse, no more than 2½% of Americans meet our qualifications as ideologues.[7] There is no clear understanding among political scientists as to why so few Americans think ideologically. After all, our society is characterized by the largest percentages of college students and graduates in the world, great affluence, and instant contact with political events through the mass media. Shouldn't these things help to produce more ideologues? Four attempted explanations of this paradox exist, but, as we shall see, none is successful.

A favorite hypothesis notes a relationship between political activity and the development of political ideologies. More generally, the argument may be formulated as follows: The greater his proximity to politics at any time, the greater is the likelihood that a person will become an ideologue. Few people participate; therefore, few are ideologues.[8] According to this hypothesis, the more active a person is in politics, the more familiar with political life he becomes. His familiarity leads him to forge the informational links between political events which encourage and sustain the growth of a political ideology. Furthermore, the more active he becomes, the more he associates with others who speak in terms of and group themselves around political ideologies, such as liberalism or conservatism. These are only a sample of the supporting arguments for the hypothesis, but they suffice for our purposes.

No one doubts the high correlation between sustained political activity and the existence of political ideologies.[9] But even if all the ideologues so defined by Converse were political "gladiators,"[10] many other political participants would not be included. Nor in reality should we expect that all ideologues engage in sustained political activity. In short, many political gladiators are no doubt able to function without the benefit of tightly knit political ideologies; and some ideologues do not become regular political participants.

The hypothesis may also be attacked even when we take the case most favorable to it. We would certainly expect, under the terms of the argument, that the sons and daughters of the politically active would be themselves especially likely to become both politically active and ideological. Politics becomes proximate to them at particularly early ages, and they, surrounded as they are by political influences and having a set of ready-made contacts, should naturally fall into a political life. However, the process is neither so simple nor so encompassing as it seems, for we can observe many sons and daughters of politicians who resist the political siren. No compelling political ideology pushes them into politics. On the other hand, there are many people from backgrounds of political apathy who, moved by motives divorced from the proximity of

[6] Robert E. Lane, *Political Ideology* (New York: The Free Press of Glencoe, 1962), p. 15. The uses of the term "ideology" are legion. Therefore, we have defined the term in our own way. For further elucidation, see *Ibid.*, pp. 13–17.

[7] Converse, *op. cit.*, p. 218.

[8] For a thoroughly tangled statement of the interrelationships of participation and cognition, see Lester W. Milbrath, *Political Participation* (Chicago: Rand-McNally, 1965), pp. 62–66ff.

[9] *Ibid.*

[10] *Ibid.*, p. 21.

political decisions, enter into political careers. Indeed, it is often those from the most unpromising backgrounds who become the most ideologically deviant and politically militant in their society. For all these reasons, it would appear that the proximal politics hypothesis is insufficient. It can not tell us why the proximity of politics is not sufficient for ideological development among all the politically active. It can not tell us why some children of politicians become active themselves and others do not. It can not tell us why some people from backgrounds in which politics is only dimly perceived become political ideologues. Nor can it tell us why some ideologues do not engage in sustained political activity.

A second, weaker hypothesis concentrates on sociological factors. This argument asserts that the development of political ideologies is associated with particular positions in the social structure. For example, as Converse and others stress, ideology is closely related to educational level.[11] It also appears that extremist ideologies often originate in social positions which are exposed to sociological discontinuities, such as, for example, status inconsistency.[12] People experiencing status inconsistency are accepted by society in some respects and rejected in others. A case in point, in terms of European society, involves the early marginal status of the Nazi ideologues, numbers of whom felt themselves worthy of respect as ex-soldiers and German patriots, but could find no place in the Weimar Republic. In addition, many of the early Nazi leaders came from geographically marginal areas of the Reich.[13] Another European case involves the many middle class Jewish ideologues, such as Karl Marx, whose financial standing was more than respectable, but whose religion set them apart.

Unfortunately, these sociological hypotheses suffer from the same difficulties encountered in our earlier discussion of the proximal politics argument. For example, there are many more people in positions of status inconsistency, particularly in an upwardly mobile, highly fluid society such as ours, than there are ideologues. Furthermore, a respectable body of sociological theory suggests that the modal response to status inconsistency and cross-pressures is withdrawal rather than activism.[14] There are, of course, many more educated men than there are political ideologues. We are forced to conclude that while this theory may provide clues to help us discover those positions in society where ideologues are most likely to cluster, it can do little more. It does not explain the existence of ideology any more than the arrival of clouds explains the consequent rain.

A third suggested explanation is also heavily sociological, though it is not so well defined as the previous two arguments examined. It may, therefore, be dealt with more rapidly. Some observers feel that while ideology in the United States and Western Europe once flourished, fed by the class antagonisms of stratified industrial societies, the age of ideology has come to a close.[15] The social basis of ideological thought has simply disintegrated under the impact of widespread affluence and the lowering of class barriers. This position may be faulted on two counts. It assumes that ideological thought was more characteristic of nineteenth century than twentieth century America, an assumption for which it is impossible to gain reliable evidence. But, in addition, it implies that contemporary American politics is not marked by ideological divisions. Yet we are living in a comparatively rich time for the generation of ideology. Black Power, Student Power, New Left Radicalism, and their conservative counterparts fill the news and shape the nation's politics. Furthermore, the segment of our population most indulged by our affluence—college students—has been disproportionately responsible for the development of these new ideologies. For these reasons, the end of ideology hypothesis is unpersuasive.

Finally, we may take brief note of an hypothesis which attributes the absence of large numbers of American ideologues to the American "national character."[16] Americans are alleged to be "pragmatic" people whose instincts do not

[11] Converse, *op. cit.*, p. 213. See also Angus Campbell *et al., The American Voter* (New York: Wiley, 1960), p. 476.

[12] See, for example, the pieces by Seymour Lipset and Richard Hofstader in *The Radical Right*, ed., Daniel Bell (Garden City: Doubleday Anchor Books, 1964); and Joseph R. Gusfield, *Symbolic Crusade* (Urbana: University of Illinois Press, 1963). For an early statement of the theory underlying these formulations, see Gerhard Lenski, "Status Crystallization: A Non-Vertical Dimension of Social Status," *American Sociological Review*, 19 (August, 1954), 405–413.

[13] Daniel Lerner, *The Nazi Elite* (Stanford: Stanford University Press, 1951), p. 85.

[14] For a review and empirical test of the two theories, see Richard M. Merelman, "Intimate Environments and Political Behavior," *Midwest Journal of Political Science*, 12 (August, 1968), 382–400. A case study of the same phenomenon is E. Franklin Frazier, *Black Bourgeoisie* (New York: Collier Books, 1962).

[15] The fullest statement of this position may be found in Daniel Bell, *The End of Ideology* (New York: Collier Books, 1961), pp. 393–407.

[16] For one of the best national character treatments of Americans, see Max Lerner, *America as a*

lead them into the airy realms of ideology. We can see immediately that this position is no explanation; it is, rather, another way of saying the same thing. Even if true, it does not tell us *why* Americans are the way they are. Therefore, the national character hypothesis is of no use for our discussion.

If none of these attempted explanations is sufficient, where can we turn? The answer is simple. The four arguments fail primarily because they are unable to account for the development of an ideology in some people and not in others. The key word, in this formulation, is *development*. A person must be psychologically capable of ideological thought. We must uncover and describe both those developmental patterns which produce ideologues and those which hinder the growth of ideology. Our definition of ideology tells us where to begin the search for these patterns. To become an ideologue, a person must: 1) have cognitive skills which allow him to see linkages between ideas and events. Such linkages determine the amount of constraint in his belief system. 2) Have a developed morality which allows him to evaluate consistently the ethical meanings of political events. In order, therefore, to explain the development of political ideologies, we must explore the course of cognitive and moral development. So far, this developmental process and the literature which studies it is largely uncodified and unintegrated into the study of both political science as a whole and of political socialization in particular. This omission is particularly important for the latter area, because political socialization is the branch of our discipline most concerned with human development. Indeed, as we shall see, knowledge about the development of moral and cognitive skills not only enlightens us about the question of ideology but also has broader import for the entire study of poliitcal socialization. Therefore, let us see if we can understand and describe the growth of those cognitive and moral skills which are prerequisites for ideological thought.

II. A MODEL OF IDEOLOGY FORMATION

We will begin by sketching an ideal-typical psychological development culminating in the ability to think ideologically. The pattern is characterized by a passage through a series of psychological stages. It is true that psychological theories relying upon developmental stages are subject to Bandura and Walter's criticism that "Stage theories have at best specified only vaguely the conditions that lead to changes in behavior from one level to another."[17] However deficient though such theories are, their division of a complex process of growth into distinct phases does provide an unusually clear model against which real-world development may be compared.

Let us first turn to the cognitive side of ideological development. As Adelson and O'Neil put it, ". . . the growth of cognitive capacity allows *the birth of ideology* [italics theirs]. . . . What passes for ideology in . . . younger respondents is a raggle-taggle array of sentiments. . . . When younger subjects are cross-questioned, however gently, they are ready to reverse themselves even on issues they seem to feel strongly about."[18] But what are the specific components of "cognitive capacity" which become the building blocks of ideology?

One of the cognitive skills indispensable for ideological thought is the ability to think causally. In order for a political ideology to grow, the individual must be able not only to see the interrelations of social events and personalities, but also to arrange such events and personalities in meaningful causal sequences. Otherwise, few ideas in his repertory will exhibit constraint. Secondly, the individual must believe that the political world is malleable, for otherwise there is no motivational basis for an activating political ideology. Finally, the person's understanding of events, his scheme of political causation, must be at least partially capable of communication to others. Developed political ideologies, such as liberalism and conservatism, are *shared*. They are based upon principles of causation which have been communicated and understood consensually. To sum up, the individual must be able to reason from cause to effect. The causes of effects in the political world must seem partially and/or potentially under human control, and the principles by which causes and effects are linked must be transmissible.

An examination of the reasoning processes of young children indicates clearly how much learning and maturation must transpire before these requirements can be met. According to Piaget and his followers, the young child is incapable of causal thought as we have described it.[19]

Civilization (New York: Simon and Schuster, 1957).

[18] Joseph Adelson and Robert P. O'Neil, "The Growth of Political Ideas in Adolescence: The Sense of Community," unpublished, n. d., 29.

[19] The most important sources for this aspect of Piaget's thought are Barbel Inhelder and Jean Piaget, *The Growth of Logical Thinking*, trans. Anne Parsons and Stanley Milgram (New York: Basic Books, 1958); and Jean Piaget, *The Language and*

Instead, the child reasons precausally until the ages of 10–13. What are the characteristics of precausal thought? Laurendeau and Pinard have isolated and examined four major forms of this childish reasoning: realism, artificialism, dynamism, and animism.[20]

According to Kohlberg, realism is "the confusion of subjective phenomena with objective things."[21] For example, young children who are asked the origins and spatial placement of such subjective phenomena as dreams report that "the events that occur in the dream have an origin external to the dreamer and also take place in front of him. . . ."[22] The child does not understand that he has created the objects he sees in the dream. The implications of this thought process are important. Because every child has a somewhat idiosyncratic subjective world, each child also has a different "real" world. Therefore, children are unable to communicate consensually enough to develop shared ideologies. Furthermore, because all phenomena are viewed as objective, the child finds it difficult to realize that some events need not be imposed upon him. He has no sense of the effects his own efforts or his own ideas might have on the world. Because it is unalterable by human effort, the world has no place for the judgments that human beings might make to change it.

In addition, the child attributes much natural and social phenomena to artifical and supernatural, hence unalterable, forces. For example, the child explains that the coming of night is not a natural, but a supernatural process.[23] The child also states that the clouds are pushed by God.[24] Unseen supernatural forces with human-like personalities manipulate the world. This childish attribution of causation to supernatural forces functions to remove many matters of choice from human control and to render the construction of a political ideology virtually impossible. Furthermore, inevitably, complex interactions of events are reduced to short and distorted sequences. The many subtleties of the transition from day to night are eliminated by invoking a personalized supernatural actor.

But the child is inconsistent. Laurendeau and Pinard also report that children often consider the movement of inorganic objects to be self-generating.[25] Why? Because movement or dynamism is taken as a sign of life. Therefore, when objects change their state, they are either directly propelled by God or by their own unregulated desires. Causation is either wholly supernatural or wholly personal. It is never natural or social. Even some college students mistake the movement of an object for a sign of life. Dennis found that many college students in his sample believed that the sea is a living organism because it moves.[26] A belief in the personal autonomy of objects and individuals except when they are subject to God's will is incompatible with the knowledge that political processes can alter events.

The unifying and summarizing principle of these precausal tendencies may be called *animism,* the tendency for the child to explain all things anthropomorphically. As Laurendeau and Pinard explain, the child attributes some form of life to virtually all phenomena.[27] Even inanimate objects have unique personalities which are peculiarly free of physical limitations or laws. Furthermore, his beliefs about the behavior of individuals become the child's tools for explaining the actions of social institutions. Adelson and O'Neil note that young children, unable to conceptualize such impersonal terms as "government" and "society," reduce such abstractions to imaginary persons able to determine their own destinies.[28] In a world in which people and things are either entirely free or entirely subjected to divine control, no intervention based on personal conviction or understanding is possible. There are no natural or social cause-effect linkages. Consequently, there exists no cognitive base on which political ideologies can be constructed.

Precausal thought in the child is accompanied by what Piaget calls egocentrism. As Piaget describes it, childish egocentrism takes two interrelated forms, personal and logical. Personal egocentrism is well illustrated by Piaget's description of childhood argumentation. The youn-

ger the child involved in debate, the more likely he is merely to assert and reassert his own position. Rarely does he confront and deal with the views of his opponent. Nor does he attempt to prove his own contentions or to probe his opponent's logic. The child is encased in his own world[29] Such egocentrism in discussion may be traced to an even earlier tendency. Piaget observes that very young children go through a prolonged period of egocentric play and speech before any habits of cooperation arise. Although several children may be playing in the same area with the same toys, they generally remain relatively unconscious of each other. Nor are they able or disposed to adopt a common play pattern.[30] The expectation of cooperation, of abiding by rules of conduct, and of observing rules of thought is slow in arriving. Childhood play, talk, and debate are variants of a single monologue.

Egocentric logic is defined by Piaget in the following way:

"Egocentric logic is more intuitive, more 'syncretistic' than deductive, i.e., its reasoning is not made explicit. The mind leaps from premise to conclusion at a single bound, without stopping on the way. . . . Little value is attached to proving, or even checking propositions. The vision of the whole brings about a state of belief and a feeling of security far more rapidly than if each step in the argument were made explicit. . . . Personal schemas of analogy are made use of. . . . Visual schemas also play an important part. . . ."[31]

In short, the child intuits the meaning of things without ever laying bare to others or to himself the principles by which his meanings are derived. It is, therefore, not surprising that he should make the sorts of logical and causal errors which hinder the development of political ideologies. Furthermore, his personal egocentrism prevents him from gaining consensual validation for his logic, faulty though it be. His thought, consequently, remains unexamined, defective, and idiosyncratic.

To be capable of ideological thought the child must surmount egocentrism and precausality. He must develop a consensually validated sense of logic and an ability to reason from social cause to social effect. Furthermore, growing ideologically necessitates his recognition that the world of human events is contingent on the behavior of men and social forces, neither of which is entirely beyond human control. Because the earliest stages of human thought are not conducive to such ideological development, it seems fair to speculate, accepting the Freudian position on the psychological dominance of earliest modes of thought, that adult political ideologies always rest on an unstable base. We shall explore the implications of this conclusion shortly.

Many of the principles of cognitive development which we have described apply, with some modifications, to the course of moral development. While in the area of cognition the child views the world as given and unalterable by human intervention, in the moral realm he finds it impossible to account for the origins of rules, regulations, or moral standards except by reference to history. When, for example, Piaget asked his youthful subjects to explain the origins of the rules which govern the game of marbles, the children replied that the rules had existed from time immemorial and were simply passed on unchanged from one generation to the next. The children could not imagine the possibility of their or anyone else's changing the rules.[32] It is easy to see what function is performed by attributing all rules and judgments to historical figures or processes. The rules, having weathered the test of time and having been sanctified by parental transmission, need not be questioned. Therefore, there exists no impulse to the formulation of political ideologies.

Because the moral standards which govern the world are given, he who violates them, regardless of motivation, is guilty. Young children evaluate rule breaking primarily in terms of the objective material effects of violation, rather than in terms of the motivation of the lawbreaker or his relation to the law. It is the degree of injury done, not the motivation of the lawbreaker or the facts of the case, which determines the extent of punishment. The world is viewed as a sort of moral machine in delicate equilibrium which, if disturbed, must be set right by the proper amount of retribution and expiation. "An eye for an eye" is the principle which insures the moral order of the world.[33]

But how is this tribute to be exacted? Again, we find in the child's answer to this question a method of removing from human agencies the necessity to make a choice and justify the choice one made. Human beings do not exercise retribution; rather, the rules themselves and the objects which they protect become the agents of punishment. The child's credo is "immanent jus-

[33] It is this tendency on the part of the child which Piaget has labeled "moral realism." *Ibid.*, pp. 109–197.

tice," which may be defined as a belief in "the existence of automatic punishments which emanate from things themselves."[34] Piaget, for example, discovered that children explained accidents to people who had earlier violated a rule by attributing the accident to the violation.[35] All disruptions of the law produce their own remedies, much as in classical Greek tragedy the Furies seek out and punish any man who presumes to challenge the natural order. The child is a great *aficionado* of the "deus ex machina."

This view of the moral world, which lifts the burden of choice from the child, is based upon a belief that laws and moral codes are objective.[36] The child conceives that moral regulations are set down clearly and unalterably within the world itself and, further, are understood consensually by all. There can be no conflict of interpretation nor failure of understanding. Therefore, if an individual violates the law he cannot defend himself by citing mitigating or idiosyncratic circumstances. The child has no sense of the relationship between his own mind and the law, nor does he see that rules are the creation of individuals and, therefore, can be modified by individuals.

It may be conjectured that the child's belief in the invariance and immanent justice of the moral order is caused by his total dependence on his parents. The human child is much more dependent on parents for a longer time than are the offspring of other species. In some primitive way, the child may compensate for this vulnerability by proclaiming the ultimate rectitude of those who control him and who are, at the same time, the symbols of history and rules—his parents. This universal tendency may become exaggerated, however. Piaget postulates that the child's natural glorification of history may be reenforced by parental resort to arbitrary commands.[37] I shall have more to say about this problem momentarily.

As maturation proceeds, the child emerges from his early conception of morality. He acquires a more subjective, more contingent view of rules, morality and transgression. This new position requires him both to investigate the motives of those who do not conform to the law and to vary his judgments accordingly. His early emphasis on punishment is replaced by a consideration of equity. Retribution and expiation give way to distributive justice. By adolescence rules are accepted only in relation to the purposes for which they are intended. For example, the adolescent understands that the rules which govern the game of marbles can be manipulated for the transitory enjoyment of the players.[38] Curiously enough, this transition may be illustrated especially well by the deviant case of psychopaths. Stephenson discovered that adolescent psychopaths, who had obviously been retarded in development, were actually *more* punitive in their judgments of other people's transgressions than were normal adolescents.[39]

Not only does the child develop a relativistic sense of morality, but he also gradually internalizes his own moral norms. The apparent inconsistency between these two processes can be dispelled quickly. The child's reliance upon sacred authority or history as the source of morality and rules, coupled with his belief that moral standards are automatically enforced, relieves him of any need to develop a conscience of his own. Conscience, on the other hand, grows only when the child desires an internal compass for the evaluation of a newly complex, contingent world. Indeed, the child's early belief in the external regulation of the moral order actually frees him to indulge in erratic behavior and inconsistent judgment. As Piaget reports, echoing Converse's observations about the political statements of non-ideologues, "It may even happen that one and the same child judges sometimes one way, sometimes the other."[40] Because the world is itself reliable and can substitute its own controls, the child does not need the judgmental consistency which conscience provides him. But once the world is seen as morally contigent and risky, the child must formulate his own rules and be able to defend them against other people's standards. The child thus moves from a "punishment and obedience orientation" to a "morality of individual principles of conscience."[41]

Cognitive and moral development are closely linked. Cognitive growth produces the realization that there are controllable human and social forces which have effects. Neither willful inanimate objects nor an invariant divine order determines the character of events. These discoveries enable the child to recognize the existence of moral variety and situational contingency. In turn, these latter realizations provide

the impulse for the development of his own moral standards. On the other hand, the child's newfound desire to internalize his own sense of morality motivates him to inquire into the actual causal structure of events. Before he can make his own judgments about human behavior, he must understand the motivations and social forces which underlie that behavior. Therefore, the development of cognitive skills and the construction of a conscience are reenforcing processes. Laying the groundwork for ideology is all of a piece.[42]

As the citations in this section indicate, much of the theory upon which we have based our description of cognitive and moral development is traceable to Jean Piaget.[43] Before leaving this discussion, therefore, it is important to point out briefly some of the shortcomings of the Piagetian stage-developmental approach. A number of criticisms have been leveled at Piaget's theories and, as a result, some important modifications have already been or are in the process of being made.

Students of child development since Piaget have become well aware of his methodological errors. His theories, which he describes as being universally applicable, are now known to suffer from cultural bias.[44] In addition, not only are his samples all Swiss, but they overrepresent the working class.[45] Nor are their sizes sufficient to generate much confidence.

There is also uncertainty about the fate of those stages through which the child has passed. Some authors hold that new stages replace and erase old, while other authors, such as Sullivan,[46] contend that new stages are terraced on old. If this latter conception is true, no stage would ever be entirely surmounted. Earlier stages would simply remain in a latent form, capable of reinstated impact under special conditions. Piaget was himself inconsistent in his formulations on the subject. At some points he implies that early stages crumble entirely under advanced phases of development, while at other times he argues that stages are only statistical tendencies and never disappear entirely.[47] The implications of this ambiguity will concern us shortly.

There is, finally, much uncertainty about the relative importance of genetic and environmental factors in Piaget's developmental scheme. Piaget attempts to recognize the importance of environment. He argues that aging forces the child into increasingly demanding social relationships, and it is these relationships which are the major intervening variables in the developmental process.[48] But he assumes that the social relationships themselves are constant at every level for every child. Such an argument implies that *all* children, excluding those who have physical and mental defects, should, as adults, manifest

[42] Parenthetically, it is striking the extent to which the development of the child, as outlined in this theory, resembles historical developments over whole eras. For example, we have talked much about the child's shift from an external, but wholly dictatorial form of morality to an internalized conscience. This shift seems to parallel what many scholars believe to be the difference between late Old Testament Judaism and early Christianity. Many scholars have commented upon the emphasis on legalism and expiation in Old Testament Judaism, and the disintegration of codification thereafter. We have no wish to argue seriously that ontogeny does recapitulate phylogeny. We only wish to indicate the parallelism. The young child's belief in ritualism, supernaturalism, the deus ex machina, etc., remind one, however, of the thought processes of "primitive" people. To develop this argument so as to make it more palatable to the reader would require knowledge and space not available to the author. The general idea seems worth pursuing, however.

[43] Piaget's immense corpus of work is only now having a major impact in the United States. For an enjoyable introduction to his thought, see David Elkind, "Giant in the Nursery—Jean Piaget," *New York Times Magazine*, May 26, 1968.

[44] See Urie Bronfenbrenner, "The Role of Age, Sex, Class, and Culture in Studies of Moral Development," *Religious Education* (Research Supplement), 62 (July-August, 1962), S-3, S-5, S-18. For contrasts between American and English children, see E. M. and M. Eppel, *Adolescents and Morality* (London: Routledge and Kegan Paul, 1966), pp. 157–170. For interesting comparative studies on Senegalese children, see Jerome S. Brunner *et al., Studies in Cognitive Growth* (New York: Wiley, 1966), chaps. 11–13. A well known study which also indicates Piaget's cultural bias is Gustav Jahoda, "Children's Concepts of Nationality: A Critical Study of Piaget's Stages," *Child Development*, 35 (December, 1964), 1081–1092.

[45] Bronfenbrenner, *loc. cit.* For the first empirical study to touch this deficiency, see M. R. Harrower, "Social Status and Moral Development," *British Journal of Educational Psychology*, 5 (1935), 75–95.

[46] For an overview of Sullivan's work, see Patrick Mullahy (ed.), *The Contributions of Harry Stack Sullivan* (New York: Hermitage House, 1952), chaps. 1–2.

[47] For example, Piaget sets only a percentage boundary on thought categories; he also admits that a particular child may evidence thought characteristic of a variety of levels at once. Piaget, *The Moral Judgment . . . , passim.*

[48] *Ibid.*, chap. 3.

similar levels of cognitive and moral development. To accept such a contention would be to undercut the major theoretical problem of this article, the widespread absence of ideology. In fact, of course, adults have widely different patterns of cognition and morality. Therefore, they evidence disparate capacities for ideological thought. Piaget's theory is probably understood best as an ideal type. People must pass through the stages he describes if they are to think ideologically, but most people do not succeed in making the passage. What are the factors which determine whether the process will be completed or not? It is these intervening factors, responsible for inhibiting the maturation process and producing different levels of ideological development, to which we now turn.

III. FACTORS PRODUCING DIFFERENT LEVELS OF IDEOLOGICAL DEVELOPMENT

The major factors which affect the course of ideological development are of two sorts: those relevant to identification and child rearing practices, and those involving the many and complex components of morality and cognition. We will investigate each sort in turn.

Of course, both psychological and psychoanalytic theory have long focused on the character of a child's identification with his parents. Theories about the identification process would not be germane to this paper, however, were it not for evidence indicating a link between positive identification and the development of moral and cognitive skills.[49] It now appears that a positive form of identification encourages the growth of political ideology.[50]

Suggestive recent evidence indicating the interrelationships of identification and ideological development may be found by turning to Keniston's studies of college students. Keniston reports that his alienated and politically apathetic Harvard students felt themselves to be rebelling against their parents and, particularly, struggling to surmount the demands placed on them by their mothers.[51] Elsewhere, Keniston discovers that the majority of campus activists identify strongly with parental authority.[52] He finds that activists are not only more likely than the other students to respect their parents, but also generally enjoy the support of their parents in their political activities. Lipset and Altbach claim that most campus activists are actually following a line of political activity gratefully in imitation of their parents.[53] Clearly, therefore, close identification with parents, at least for these primarily middle class students, forges an important link in the chain of ideological development.

We know that the structure of the family affects the likelihood of successful identification. There is considerable evidence which indicates, for example, that the children of husbands and wives who value the same things are more likely than are other children to identify with their parents.[54] This finding is easily interpretable. It is unlikely that there will be much tension in homes where the parents approve of each other. Furthermore, parents who profess the same values will present a fairly consistent picture of themselves to their children, and will also display a single set of ideals for emulation. In short, parents who approve of each other minimize cognitive and moral confusion in their children.

Unfortunately, however, the effects of most

[49] See the review and codification of the relevant literature in Robert F. Winch, *Identification and Its Familial Determinants* (Indianapolis: Bobbs-Merrill, 1962).

[50] This formulation should not be taken to imply that identification has an unambiguous meaning. Lazowick, for example, has specified at least three major definitions which seem currently in use: 1) acting as if the subject were the same person as his model; 2) imitating the model; 3) introjecting the model's norms and values. Lionel M. Lazowick, "On the Nature of Identification," *Journal of Abnormal and Social Psychology,* 51 (September, 1955), 175–184, 175–176. Bronfenbrenner specifies yet a fourth meaning, i.e., acting in terms of an ideal image of the model rather than on the basis of his actual behavior. Urie Bronfenbrenner, "The Study of Identification through Interpersonal Perception," in *Person Perception and Interpersonal Behavior,* eds., Renato Tagiuri and Luigi Petrullo (Stanford: Stanford University Press, 1958), pp. 110–131, 123. Despite their importance for psychology, these definitional ambiguities do not affect the basic argument of this paper.

family structure characteristics on identification remain obscure. This is true particularly of such factors as father absence.[55] Consensus comes nearest to existing only on the matter of child rearing patterns as they affect identification.

Within the bounds of psychological theory there have been two major schools of thought about patterns of child rearing in the identification process. One school, populated largely by Freudians, has postulated that identification is the result of a childhood defensive reaction against a highly punitive and physical parental environment. The child, supposedly fearing his severe parents, fantasizes himself retaliating against them. But his retaliation fantasies, because they would bring abnormally severe retribution if acted out, are even more disturbing than the parental environment itself. Therefore, the child tries to repress his rebellion. But his repression can succeed only if he internalizes the values of his parents. The process ends with the child identifying with the agressors, his parents.[56]

Anaclitic theories of identification, which comprise the second school, dispute the truth of these assertions. According to the anaclitic theorists, successful identification is most likely to occur in a warm, tightly knit, relatively permissive family atmosphere. Discipline in such a family proceeds primarily through threats to withdraw love rather than through the imposition of physical sanctions. Anaclitic theorists claim that love and succor encourage the child to reflect on his own behavior and internalize those standards which will prevent withdrawal. Also, according to Hoffman, parents who do not punish their child physically provide him with a model of restraint that he is motivated to emulate.[57] The behavior of parents who discipline by physical aggression, however, encourages the child to believe that internal controls are unnecessary. Therefore, physical sanctions actually encourage rebellion. Anaclitic theorists also claim that physical punishment breeds the primitive, expiatory form of morality which we have described, rather than an internalized set of values.

Students of identification also differ over the autonomy-supervision dimension in child rearing. Theorists of defensive identification argue that the imposition of close parental supervision is necessary for the growth of identification. The anaclitic theorist Robert Sears claims, however, that identification is dependent upon parental willingness to grant the child a measure of autonomy to develop his own personality.[58] The child must be expected to adhere to certain standards, but the parent should not remain hovering over him monitoring his behavior and correcting minor faults.

As the debate indicates, interpreting the effects of varying child rearing patterns on identification has not been easy. Nor has the dialogue been as clear on terms and hypotheses as one might desire. For example, the control relationship between parent and child—as most parents and virtually all children realize—is both multidimensional and subtle. A parent who is demanding in one phase of his child's life may be permissive or uninterested entirely in another. Measures of identification and control capable of dealing with these subtleties have been noticeable mainly by their absence. Not surprisingly, therefore, research linking child rearing practices to identification is not entirely consistent or reliable. However, there seems to be a growing consensus along three dimensions. These dimensions are the mode of punishing children, the warmth of the relationship between parent and child, and the age at which responsible behavior on the part of the child is first expected. Let us investigate these three dimensions as they affect identification, cognitive development, and moral development.

As Hoffman puts it, summarizing the research on punishment and moral development, "The relatively frequent use of discipline that makes some sort of appeal to the child's inner need seems to foster the development of an internalized moral orientation, especially as reflected in

[55] For concise statements of opposing positions, see Winch, *op. cit.*, p. 35, and Joan McCord, William McCord, and Emily Thurber, "Some Effects of Paternal Absence on Male Children," in *Studies in Adolescence,* ed., Robert E. Grinder (New York: Macmillan, 1963), 118–133. For studies indicating the possible importance of father absence to both identification and political ideology, see Keniston, *The Uncommitted . . .* , esp. 113–118; and Dean Jaros, Herbert Hirsch, and Frederic J. Fleron, Jr., "The Malevolent Leader: Political Socialization in an American Sub-Culture," this REVIEW, 62 (June, 1968), 564–578, 573.

[56] Morton Deutsch and Robert M. Krauss, *Theories in Social Psychology* (New York: Basic Books, 1965), p. 158.

[57] For a review of these theories, see Martin L. Hoffman, "The Role of the Parent in the Child's Moral Growth," *Religious Education* (Research Supplement), 57 (July-August, 1962), S-18 through S-33, S-22.

[58] Robert R. Sears, "Identification as a Form of Behavioral Development," *The Concept of Development,* ed., Dale B. Harris (Minneapolis: University of Minnesota Press, 1957), pp. 149–162, 160.

the child's reactions to his own transgressions. The use of coercive measures that openly confront the child with the parent's power, on the other hand, apparently contributes to a moral orientation based on the fear of authority."[59] According to available evidence, the parent who resorts to physical punishment not only provides an aggressive model for his child, but also demonstrates vividly to him the unbridgeable gulf between his own standards and those of the child. Such a parent makes no appeal to the child's own latent moral sense. The use of psychological punishment, such as threatened love-withdrawal, assumes a standard shared equally by the child and his parents. Such a technique accustoms the child to think through and judge the behavior which has disappointed his parents. Physical sanctions also appear to suggest to the child that merely his willingness to absorb pain provides an expiation for wrongdoing. Moral rectitude does not require his own set of values. The child who is, implicitly, treated as an adult temporarily unable to meet shared standards learns to evaluate himself; but the child who is not taken into his parents' confidence and who is punished physically begins to expect society to judge him. An internalized conscience, obviously, is the moral base from which ideological preferences grow. Reliance on external authorities to define what is proper builds no stable moral framework within which political events can be arrayed.

There is also evidence that parental warmth toward children stimulates the growth of a consistent, internalized moral orientation.[60] Of course, an affectionate environment may be viewed partly as an off-shoot of certain discipline techniques, but the warmth of family relationships seems to have its own independent effect. The same principles operating in the punishment dimension seem to obtain here. In addition, however, unlike the children of punitive and distant parents, the children of affectionate parents have good reason to feel conflicted about violating parental standards. The kindness of parents may well seem to demand better repayment. Tensions of this kind may force children to evaluate their own behavior carefully. The habit of self-evaluation is certainly a major requirement for the growth of a stable, internalized moral orientation.

Finally, the time at which responsibility is first expected of the child seems related to the growth of a moral sense. Studies by Grinder[61] and by Whiting and Child[62] show that the child's early assumption of responsibility results in a propensity to feel guilt and to experience remorse after transgression. The principle may be illustrated simply. When, for example, the child is given early responsibility for his own toilet and cleanliness, he is, in effect, on notice that he is to be held responsible for an important part of his behavior. This sense of responsibility encourages him to make autonomous decisions and to think for himself.

To sum up, the optimal child rearing pattern for the growth of conscience appears to combine rapid shouldering of responsibility, the use of psychological discipline, and continuing parental warmth. This pattern is found rarely, with two factors primarily responsible. First, many parents believe that warmth, affection, and "permissiveness" are incompatible with the child's early assumption of responsibilities. They construe permissiveness broadly so as to make it require late and relatively lax training in fundamental areas. Second, many parents who do attempt early toilet training find it difficult to remain affectionate toward their children when errors occur. Their punitive response often sets a continuing pattern. Hence, early training may well become associated with physical punishment, relatively cold parent-child relations, and considerable anxiety on all sides.

We have less evidence about the effects of differing child rearing styles on the growth of cognitive capabilities than we have of their influence on moral development. However, some experimental findings permit speculation. Solley and Murphy report that punishment by the use of electric shock disrupts the ability of experimental subjects to distinguish between figure and ground.[63] Such findings suggest that large doses of physical punishment may disorient the conceptual apparatus which permits the individual to make the elementary perceptual distinctions necessary for ideological thought. Physical punishment concentrates the subject's mind on only those of his acts which have painful consequences, thereby depriving him of varied sensory stimulation. The subject focuses primarily on his suffering, rather than on the world around him. This sensory deprivation effect may be thought of as a kind of psychological "tunnel

vision." As Solley and Murphy indicate, sensory deprivation may become associated with autism, the pathological rejection of environmental stimuli.[64] The autistic person finds the world dull, undifferentiated and, ultimately, unworthy of attention. In short, the excessive use of physical punishment may reduce both the desire and the ability to view the outer world in all its richness. In non-experimental contexts, such as concentration camps, observers have noted similar effects.[65] The relevance of this discussion both to child rearing and to the growth of ideological thought needs no elaboration.

We referred earlier to the debate over whether child development proceeds via a substitution of entirely new phases for old or by a terracing of new stages over latently powerful older, more "primitive" stages. If we assume that the former process operates, non-adoption of the optimum child rearing process which we have described may fixate the child at a particular stage of development. But if we assume that development proceeds regardless, imposition of punishment or threat may still cause at least temporary regression to a more primitive behavioral stage. In the latter case, we would also expect that an adult whose early development had been disrupted by faulty child rearing would be especially prone to regress under imposition of punishments identical or symbolically equivalent to those he experienced as a child. Experiments on both humans and lower animals provide some interesting illustrations.[66]

Let us examine the fixation effect first. Kleemier reports that rats who have been frustrated by the use of electric shock develop severe response rigidity. Not only do they find it difficult to respond to new demands, but even after shock is removed so as to open up new options, the rats cleave to old behavioral patterns which will not reward them.[67] Frustration induced by severe punishment glues them to a particular developmental level. Comparable behavioral and perceptual rigidity in humans would cut down the range of attention necessary to interpret the political world ideologically.

Frustration, no matter what its source, has its own fixation properties. Maier reports on a variety of experiments which indicate that frustrated rats and humans settle on a few patterns of behavior, often the ones least functional, and remain with them. Rats, for example, resort to "symbol stereotypy," an invariant but unrewarded response to a specific sign.[68] Their behavior becomes almost purely ritualistic. Lawson and Marx show that frustration retards perceptual acuity, problem solving abilities, and learning.[69] In short, both excessive physical punishment and frustration rigidify behavior and retard cognitive development. These effects persist even after the cessation of frustration and physical punishment. They inhibit the growth of an ideological framework responsive and alert to new pieces of information.[70]

The psychodynamic process by which fixation occurs may have as its core the experience of anxiety. Sullivan, for one, believes that the onset of anxiety can be traced either to psychological distance from the mother or to excessive punishment. He also claims that anxiety inhibits moral and cognitive development.[71] Odier describes the close relationship between the experience of anxiety and consequent primitive, magical, and animistic interpretations of events.[72] The obsessive, repetitive, ritualistic thought patterns of anxious people are similar to, though more elaborate than, the early forms of thought in the

[64] *Ibid.*, p. 62.

[66] Some may question this introduction of data drawn from studies conducted on lower animals. I have used this material not because I think it definitive (I would not even argue the point), but precisely because it is illustrative. Were I to attempt a definitive argument on this point, I would naturally rely wholly on studies of humans. It is, however, possible that the same reactions which exhibit themselves in purity with lower animals also occur in humans, but are masked or distorted. We ought not to assume that the responses of lower animals and humans are incomparable. They may be different in expression, but not in substance.

[72] Charles Odier, *Anxiety and Magic Thinking*, trans., Marie-Louise Schoelly and Mary Jane Sherfey (New York: International Universities Press, 1956), pp. 52–53. Odier's work is one of the few attempts to bring together Piaget's and Freud's perspectives on human development.

child as Piaget and his followers have described them.

If we prefer the terracing rather than the substitution theory of development, we can also marshal illustrative evidence showing that frustration, physical punishment, and anxiety may cause behavior to regress, at least temporarily, to a primitive stage. In a famous experiment, Barker, Dembo, and Lewis found that children who were permitted to see but were forcibly prevented from playing a second time with some desirable toys regressed. Specifically, their behavior became disorganized and their physical movements undifferentiated.[73] Barthol and Ku demonstrated that college students reacted to task-induced frustration by returning to their first learned successful task behavior, even when such behavior was no longer appropriate.[74] Adelson and O'Neil discovered that when children became angry or anxious, there was a "momentary cognitive regression, expressing itself in a loss of abstractness, and a reversion to personalized modes of discourse."[75] The terracing theory would predict that even persons normally capable of expressing a political ideology would, under stress, regress cognitively and morally, becoming at least temporarily unable to think ideologically. Any such reversion, as Odier points out, is likely to be characterized by special attention to the symbolic aspects of experience rather than to the factual, by a disposition to make absolute, rather than contingent, judgments about events, and by a willingness to rely heavily upon supernatural "signs."[76]

To sum up, the frustrations and anxieties which inadequate child rearing methods produce may inhibit the identification process and prevent the growth of cognitive and evaluational skills sufficient for the development of political ideology. Furthermore, the imposition of excessive physical punishment and frustration on normally ideological people may induce a regression to less ideological conceptual frameworks. These remarks have obvious implications for understanding the paranoic and disorganized behavior of individuals during political crises.[77]

The second class of variables which influences ideological development includes the components of the moral and cognitive dimensions themselves. Two such components are the sense of time and the ability to handle language. To think ideologically requires the capacity to link present trends to preferred future states or past experiences. Therefore, the character of political cognition is partly determined by the experience of time. Although little is known about the development and stability of the consciousness of time, Ames discovered that the younger the child the less likely he is to have a conception either of past or future.[78] The very young child lives in an eternal present, attaining a sense of future by age three and a sense of past only by age three and a half.[79] The most natural and earliest mode of viewing the world is in the present. Child rearing patterns which fixate or cause regression might restrict the child to the incomplete experience of time evident in the early months of life. The effects of traumatic events may alter even the adult's consciousness of time.

Nor is the sense of time important only for cognition. Mischel discovered that children who prefer immediate small reinforcements to delayed larger reinforcements, when compared to children with an expanded time orientation, scored extremely low on a scale of social responsibility.[80] Grim, Kohlberg and White claim that ". . . there is substantial evidence relating indexes of moral character to ego-strength factors such as . . . anticipation of future events. . . ."[81]

We would also expect to find in language a second cognitive component relevant to ideological thought. Traditionally, and Ames seconds this conclusion,[82] we have assumed that children first use language concretely and then ab-

stractly. If this were true, we might postulate that the abstract language ability necessary for ideological thought rests on as unstable a developmental base as does the sense of time. However, Roger Brown disputes Ames' position by arguing that, "The child's vocabulary is more immediately determined by the naming practices of adults."[83] In some cases, as Brown shows, language development may proceed from abstract conceptions to more precise differentiations within such conceptions. At present it only seems safe to conclude, with Brown, that "The vocabulary of a child is not a very direct index of his cognitive preferences."[84] Language development may be sufficiently idiosyncratic to defy generalizations about its relation to ideological thought.

While cognitive and moral development depend on a complete sense of time and an ability to abstract, the actual character of cognitive and moral judgments presents its own problems. Let us use as an example the development of morality, about which we have expended so much effort. Piaget assumed that morality was a unidimensional quality which could be measured accurately by asking children about their likely behavior in situations which presumably tempted them to violate their sense of rightness. However, verbal responses to hypothetical temptations expose only one aspect of the moral sense. Investigators of moral development have utilized at least three other designs. Some researchers have examined the actual behavior of children in situations where they have been tempted to violate moral injunctions. The earliest and most influential studies of this sort were conducted by Hartshorne and his associates.[85] Other researchers have investigated the extent to which children express guilt after transgression. Yet others have asked children to imagine their likely reactions to hypothetical situations in which they are supposed to have transgressed.

Interestingly enough, MacRae shows that intercorrelations along these four dimensions are far from perfect.[86] Consequently, there is reason to believe that conscience is a multidimensional collection of attributes. Complete moral development in a person might be characterized by high correlations between moral dimensions; in fact, high correlations might serve as an operational *definition* of complete moral growth. But such development is hindered by the fact that at least four complex moral dimensions must be mastered and integrated. The child must learn to resist actual temptation, feel remorseful after transgression, resist his own imaginary temptations, and imagine his guilt after fantasized transgressions. Development along these dimensions apparently does not proceed at parallel speeds with identical end-points.

The complexity of cognition and moral judgment raises the chances of cognitive and moral instability. The more capacities to be mastered, the less likely it is that there will be consistency along any single dimension. Evidence confirms the suspicion. The Hartshornes discovered that children who cheated at one time refrained at another, despite the fact that objective circumstances had not changed.[87] More recently, Durkin found that the same child judges instances of a single class of reciprocity problems differently with no apparent rule tying the judgments together.[88] These findings parallel exactly Converse's discovery that as one proceeds from more to less informed publics, persons judge the same political events and objects differently within relatively short periods.[89] Perhaps the explanation of Converse's finding inheres in the complexity and fluidity of those moral and cognitive skills which underlie political judgment. Converse's finding, in other words, becomes less perplexing when we recognize that, for many, political perceptions are underpinned by unstable moral and cognitive senses.

These remarks are not intended to suggest any inadequacy in the picture of development Piaget and his followers have sketched. All we have meant to stress is that both the multidimensionality of moral and cognitive maturation

and the rarity of optimal child rearing techniques make development problematic. It is therefore not surprising to discover that so few individuals develop into political ideologues.

IV. POLITICAL SOCIALIZATION AND THE DEVELOPMENT OF IDEOLOGY

While this paper's focus has been on the developmental roots of political ideology, it should by now be apparent why I feel that the theory it explicates also has applicability to the political socialization literature. Indeed, we have already considered a few findings in the socialization area which are interpretable in terms of the developmental factors we have outlined. More data on political socialization can be integrated into this general framework, thereby providing some conceptual unification for a field which, currently, may well be accused of vulgar empiricism.[90] Let us briefly review some socialization literature which our framework subsumes and illuminates.

Two classes of socialization findings fit into our discussion. One set may be understood primarily by means of the developmental sequence presented in Part II of this paper, the other in terms of the retardation or facilitation factors discussed in Part III.

The developmental sequence helps account not only for the growth of political ideology, but also for the oft-noted "authoritarianism" of the child. We can now see that the child's authoritarian view of politics is only an extension of, first, his natural tendency to idealize history and authority; second, his belief in the inability of humans to alter the world; and third, his conception of justice as a self-regulating, mechanical, expiational process. Similarly, the "benevolent leader" syndrome[91] by which the child links himself to the polity may be explained partly by his inability to reason abstractly, to be self-conscious about his thinking, or to relate concrete judgments to general rules. Because the child reasons intuitively and syncretically, he reaches the personal application side of thought very rapidly. Reliance on a benevolent leader is both the outcome and the symbolic representation of a syncretic rather than analytic thought process. The "benevolent leader" syndrome, in other words, is an elliptical and condensed expression[92] of syncretic, personalized, unself-conscious thought. As Adelson, Siegel, and Piaget agree, not until the crucial 11–14 age range do children gain the capacity to reason abstractly and thereby arrange their relationship with the political system on different terms.

The intervening factors which determine the outcome of the developmental process illuminate a second set of socialization findings. We have argued that failures in cognitive and moral development seem uniquely linked to the psychological process of identification. This contention has already permitted us to interpret the perhaps puzzling discovery that student rebels and ideologues are *not*, by and large, also rebels against their parents. This generalization may be extended now to other kinds of political leadership. For example, Malcolm X in his *Autobiography* speaks in glowing and sympathetic terms of his mother, whose tribulations apparently sparked a latent political interest in him.[93] Nor should it be surprising that the children of clergymen seem to be especially prone to political activism.[94] These children, more than others, must incorporate moral norms in order to identify successfully with their parents.

The modalities of intergenerational transmission of party identification—at the heart of much socialization literature[95]—also become more understandable by use of the framework. We can explain why such transmission is easiest in the child's early years, because it is then that the child views the parent as the embodiment of a stable moral order. But we would also predict that when the conditions for identification between parents and children are weakened, the transmission process will similarly be endangered. Jennings and Niemi find, for example, that transmission of party identification from

[90] For a recent article which evidences realization of this problem, see Jack Dennis, "Major Problems of Political Socialization Research," *Midwest Journal of Political Science,* 12 (February, 1968), 85–115.

Torney, *The Development of Political Attitudes in Children* (Chicago: Alldine, 1967), chaps. 2–3; Jaros, Hirsch, and Fleron, *op. cit.*; and Jaros, *op. cit.*

[92] These aspects of childish thought seem similar to "dreamwork" in the psychoanalytic theory of dreams.

[93] *The Autobiography of Malcolm X* (New York: Grove Press, 1964), chap. 1.

[94] The names of Woodrow Wilson, Harriet Beecher Stowe, Martin Luther King, Jr., and Malcolm X come most readily to mind.

[95] See Herbert Hyman, *Political Socialization* (Glencoe: The Free Press, 1959), pp. 69–85; Greenstein, *op. cit.,* chap. 4; Hess and Torney, *op. cit.,* chap. 9; Campbell *et al., op. cit.,* chap. 6; and M. Kent Jennings and Richard G. Niemi, "The Transmission of Political Values from Parent to Child," this REVIEW, 52 (March, 1968), 169–185, 172–174.

parent to child is considerably less successful today than it appears to have been a generation ago.[96] How can this change be explained? It is no secret that the present generation of American families is more plagued by divorce than were its predecessors. In most cases, divorce results in family disintegration, bitterness, and a breakdown of communication between the generations. Children viewing the breakup of their parents' marriage can seize on more than enough reasons not to identify with those parents. Obviously, divorce is not the only factor at work in weakening the identification process; I have used it merely as an illustration. Those many aspects of contemporary life which are responsible for the celebrated "generation gap" no doubt contribute as well.

Of course, a framework's analytic utility should be judged not only by the existing findings it interprets, but also by the originality of the hypotheses it yields. Does our framework pass this test? Let me indicate three kinds of nonobvious questions which our framework leads us to investigate. I shall start with a relatively low-level hypothesis, move through a middle range question, and continue on to what might be called a systemically relevant problem.

First, though I have indicated the importance of identification to the acquisition of a political ideology and have specified some factors which affect the identification process, the specification is incomplete. For example, identification might be related to birth order because, as Stephenson points out, ". . . the higher the birth order of the child, the more time will the parents be able to spend with the child."[97] Assuming Stephenson is correct, we would predict that firstborn children would be especially likely to become political ideologues. But we should also expand and qualify this hypothesis somewhat. It is proverbial that not only first but also last-born children get heavy doses of parental attention. It is true that for a time the oldest child has exclusive claim to parental interest and, often, to parental hopes, but the last child, normally coming relatively late in the reproduction cycle, often receives a tenderness and warmth not afforded his brothers and sisters. To his parents he may seem nature's going-away present. Therefore, intermediate children may be less likely to identify with parents and, consequently, less likely to become political ideologues.

A middle range hypothesis takes up the differing and inconsistent moral standards evidenced by most children. We have already noted the relationship of these findings to the adult ideological inconsistencies uncovered by Converse. This parallelism indicates the need for a searching inquiry into the variety of moral standards people employ in their perceptions of political events. Are different standards applied to different classes of events, institutions, or personalities? Are there ways of predicting or describing the standard in use for any particular perception? Until now, most investigations of public opinion have generally assumed, very superficially, that people employ a single judgmental dimension in evaluating politics. Only Lane's work has described fully the many moral standards applied to politics.[98] Our framework leads us to hypothesize that single moral standards and judgmental consistency will be applied primarily by people whose parents were warm to them, accorded them responsibility early, and disciplined them psychologically. Other child rearing patterns will lead to a fragmented view of the political world.

Finally, at the systemic level, we may investigate the intertwining of moral and cognitive development. I argued that moral and cognitive progress reinforced each other. The need to evaluate the world gives rise to the desire to uncover the causal patterns *in* the world, and vice versa. I also implied that impairment of development affects cognition and evaluation equally. But there are certainly *uneven* rates of moral and cognitive development. What might be the outcome if, for some reason, a person's cognitive development proceeded faster and more smoothly than his moral development? Though there is currently no way by which to explain such aberrant processes, we can at least hypothesize about effects. For example, we might predict differing occupational patterns for people with different balances of moral and cognitive abilities. Children whose moral development exceeds their cognitive development might be attracted to occupations where moral questions are central. Such people might enter religious

[96] Compare *ibid.* with Hyman, *op. cit.*, p. 74.

[97] Stephenson, *op. cit.*, p. 112. For evidence indicating the superiority of first-born children over middle children in two other spheres—occupational and educational achievement, see Peter M. Blau and Otis Dudley Duncan, *The American Occupational Structure* (New York: Wiley, 1968), pp. 307–308.

[98] Lane, *op. cit.* For an excellent empirical description of one kind of ideological structure, with moral standards at the forefront of the discussion, see Leonard Berkowitz and Kenneth G. Lutterman, "The Traditionally Socially Responsible Personality," *Public Opinion Quarterly*, 32 (Summer, 1968), 169–186.

careers. On the other hand, children whose cognitive capacities outstrip their moral faculties might be attracted to occupations requiring advanced cognitive skills but little moral judgment. Might this be true of mathematicians? Finally, what mix of moral and cognitive development will lead a child to the political life, and might this mix differ from culture to culture?

So much for the organizing and heuristic values of this framework. The argument developed here has several specific implications for the understanding both of political structures and of ideology—implications which I wish to highlight in conclusion. Assuming, as I have, that early learning and conceptualization processes have lasting impacts, the sequence of development favors some political movements and regimes over others. Specifically, movements of the left rest on a less secure psychological base than do movements of the right. Left movements, in their call for innovation and their emphasis upon the secular over the sacred and equity over expiation, appeal to high levels of moral and cognitive development. Movements of the right stress the need to respect authority, tradition, and punitive law. In so doing, they appeal to the earliest inculcated and most "natural" forms of thought. Therefore, more people are capable of reaction than reform.

For these reasons the revolutionary cycle from reform to reaction, which Brinton describes in structural terms,[99] may also be understood as a psychological problem. It is difficult for the mass of people to sustain commitments to left movements. Therefore, after such movements have succeeded in redistributing wealth or property, the less ideologically sophisticated adherents become apathetic or even antagonistic. As a consequence, leadership passes from agitators to colorless administrators or ruthless pragmatists. The maxim, "The revolution swallows its own children," is not entirely accurate. Rather, the children of the revolution defect, and can be brought back only by coercion. This formulation need not imply, however, that reactionary movements are invariably successful. Movements of the right in democratic regimes are forestalled both by leaders whose psychological capacities allow them to maintain a commitment to gradual reform, and by the apathy, inconsistency, and material self-interest of mass publics.[100]

We can also understand how difficult it is to meet the psychological requirements for a stable democratic regime.[101] Democracy demands much with its emphasis on openness, flexibility, gradual reform, progress through secular endeavor, and tolerance for those on the margins of society. Most people do not reach a high enough level of moral or cognitive development to maintain a long-run commitment to such a system. Either democracy must support itself by assuring material well-being for most of its citizens[102] or it must extract commitment at the cost of developing in its people a sense of nationalism. Both forms of support may eventually come into conflict with the norms of the system itself. We are led to the conclusion that diverse kinds of democratic commitment, resting as they do on different modes of perception and evaluation, provide considerable potential for fission and fragmentation. As Lasswell argued long ago, insufficient cognitive and moral development constitute continuing threats to democracy.[103]

We have also considered evidence and theory suggesting that individuals may slide between levels of political perception depending upon events. The implications of this discovery are far-reaching, and take two forms. First, we need to identify both the characteristic processes by

[99] Crane Brinton, *The Anatomy of Revolution* (Englewood Cliffs: Prentice-Hall, 1965).

[100] For evidence on these characteristics of mass publics, see Samuel Stouffer, *Communism, Conformity, and Civil Liberties* (Gloucester: Peter Smith, 1963); Herbert McClosky, "Consensus and Ideology in American Politics," *Political Opinion and Electoral Behavior*, ed., Edward C. Dryer and Walter A. Rosenbaum (Belmont, Calif.: Wadsworth, 1966), 236–267; James W. Prothro and C. W. Grigg, "Fundamental Principles of Democracy: Bases of Agreement and Disagreement," *Journal of Politics*, 22 (Spring, 1960), 276–294; Bernard R. Berelson, Paul F. Lazarsfeld, and William H. MacPhee, *Voting* (Chicago: University of Chicago Press, 1954), chap. 14. For a recent critique, see Peter Bachrach, *The Theory of Democratic Elitism* (Boston: Little, Brown, 1967).

[101] A study which addresses this problem is Harry Eckstein, *A Theory of Stable Democracy* (Princeton: Center of International Studies, 1961).

[102] Seymour Martin Lipset, *Political Man* (Garden City: Anchor Books, 1960), chap. 2.

[103] Harold D. Lasswell, "Democratic Character," in *The Political Writings of Harold Lasswell* (Glencoe: The Free Press, 1951), pp. 465–525. For a recent discussion of these same problems, see Fred I. Greenstein, "Personality and Political Socialization: The Theories of Authoritarian and Democratic Character," *The Annals*, 361 (September, 1965), 81–95.

which people shift and the circumstances which contribute to such movement. Edelman explores the mechanisms by which feared or experienced sanctions can cause regression to less advanced modes of political perception.[104] But political crises of a magnitude sufficient to cause widespread severe regression rarely occur. We should concentrate, therefore, on the process by which less traumatic but more frequent political events induce movement between cognitive and evaluative levels. At the very least, as Converse's discussion demonstrates,[105] there is need for periodic replication of all attitude studies.

Second, we should not ignore the effects of our making attitudinal inconsistency and slippage a primary assumption in the study of politics. Accepting such a premise makes our tasks doubly difficult. Many of our most cherished findings, not only from the "behavioral" sides of political science—such as public opinion and electoral behavior—but also from the more institutional areas of the discipline, become problematic. Still, these retrenchments seem required if the foregoing argument is persuasive.

[105] Converse, *op. cit.*

EXPANDING THE POLITICAL PRESENT

HENRY S. KARIEL
University of Hawaii

"Nothing we have created, in politics or literature, is necessary...."

—RICHARD POIRIER

Theory expressing new dimensions of man's political predicaments has rarely emerged from well-accredited academic quarters. Yet political scientists have come to hope that their own discipline, imaginatively pursued, might nevertheless yield comprehensive theories for coming to terms with man's present and prospective situations. To cope with emergencies—if not those of the year 1984 then those of the now more fashionable year 2000—they have proceeded to delineate possible futures. It is hardly necessary to document how industriously they have been extrapolating from the present, becoming interested in simulating, linear programming, gaming, and projecting into the future. With methodological ingenuity and resourcefulness, practitioners of futuristics have provided a new literature which is unconventional, exciting, and at times intriguingly surrealistic.[1] Like Bentham's and Saint-Simon's more buoyant pieces, it has all the trappings of authentic radical thought: it appears to challenge the prevailing intellectual and institutional boundaries.

Yet in view of the ideological constraints inherent in every professional discipline, it would be surprising if the new blueprints and scenarios were to inspire men to transcend the present political order, if the new utopians (to use Robert Boguslaw's apt label) acknowledged something other than the prevailing system of psychological, economic, and industrial norms as their point of departure. They understandably begin with the present, that which *is*. They perceive what various forms of systems analysis have shown to exist: man as egotistical utility and power maximizer, public policy as interest group inputs, the economic sector as primary generator of community goods, governmental structures as hierarchical organizations, politics as a sacrifice of personal values, psychological and economic resources as scarce, and development as whatever leads toward the fulfillment of this empirically confirmed vision. Notwithstanding the criticisms of Peter Bachrach, Robert Paul Wolff, Murray Edelman, Graeme Duncan, Irving Louis Horowitz, and others,[2] the new utopians begin with observed experience. And as they proceed, they reveal that not even the injection of temporal concepts into systems analysis—careful references to change, development, or dynamic processes—is sufficient to prevent their work from vindicating what is patently present.

Projections being impossible without some sort of baseline, it may be hard to see how it could be otherwise. Still, we know that what has existence for us depends on what we perceive to be there, on conditions we admit (sorrowfully or cheerfully) to be present. Few would disagree with Kant that "the present" is at least partially the result of intention, decision, and action. It is constituted by our power to designate and signify, the power to establish values.

But such power is not claimed by the authors of those exercises in futuristics which are the most frequently cited.[3] The new utopianism professes no value commitments. To be sure, it favors formal coherence, structural tidiness, and the use of denotative terms. Moreover, it reveals a preference for a rationally controlled future

[1] See especially Robert Boguslaw, *The New Utopians* (Englewood Cliffs, N.J.: Prentice-Hall, 1965); Bertrand de Jouvenel (ed.), *Futuribles* (Geneva: Droz, 1963), Vols. I and II; Olaf Helmer, *Social Technology* (New York: Basic Books, 1966); Daniel Bell (ed.), *Toward the Year 2000* (Boston: Houghton Mifflin, 1968); Andrew Kopkind, "The Future-Planners," *The New Republic* (February 25, 1967), 19–23; William Ewald, Jr. (ed.), *Environment for Man: The Next 50 Years* (Bloomington: Indiana University Press, 1967); Office for Industrial Associates, *The Next Ninety Years* (Pasadena: California Institute of Technology, 1967); Robert Prehoda, *Designing the Future* (Philadelphia: Chilton, 1967); Herman Kahn and Anthony J. Wiener, *The Year 2000* (New York: Macmillan, 1967); Zbigniew Brzezinski, "America in the Technetronic Age," *Encounter*, 30 (January, 1968), 16–26; Stanford Anderson (ed.), *Planning for Diversity and Choice* (Cambridge: M.I.T. Press, 1968).

[2] Critiques of an arrested, excessively narrow empiricism may be found in two collections of readings: Charles A. McCoy and John Playford (eds.), *Apolitical Politics* (New York: Crowell, 1967); and Henry S. Kariel (ed.), *Frontiers of Democratic Theory* (New York: Random House, 1969).

[3] The best example is the work by Kahn and Wiener, *The Year 2000*.

over one which might merely happen. But its practitioners refrain from discussing the valuation implicit in their concern for the integrity of one set of contemporary phenomena as opposed to others. The constitution of the present, they assume, is valid, or at least given. For them, "the present" is not so much a concept as a benign state of being. For them, there *is* a present to which their charts and words presumably give full credit. Because they do not see themselves as creatively attaching names to experiences, as accrediting institutions and behavior patterns, they simply treat as present whatever is fortunate enough to have been caught in their net of concepts. The present virtually presents itself, and the new utopians turn out to be no more than attentive, solicitous representatives of established reality. Playing this passive role, they seem to make no decisions. In the name of science, they behave like primitive man for whom, as Wendell Bell and James Mau have noted, "ends were seldom questioned and means were often invested with ritualistic significance."[4] Giving expression to a seemingly autonomous process of history, they do not appear to act either in favor of some aspect of reality or against an infinity of dormant alternatives. They do not appear to discriminate against those parts of the past (and the future) which remain buried in the present moment. The new utopianism, it would seem, is altogether "realistic" and "empirical."

I

Reifications serve to restrict politics to the few. Less epigrammatically, to identify reality exclusively with such abstractions as "balance of interests," "national honor," "private property," or "industrial man" is to acquiesce in the policies of those in society who have the power to create reality, who are free enough to structure man's consciousness of space and time. Moreover, to assume the finality of experiences which might yet change is to betray a commitment to *de facto* conditions—and to those who benefit by them. Such reification—and its consequent acceptance of the exercise of political power by the few—becomes insidious when done in the name of realism and science: it degrades the unperceived part of reality and the whole of science.[5]

Insofar as the new utopianism eliminates alternative realities by embracing as "real" the very institutions which the social sciences properly subject to continuous criticism, it is anti-empirical as well as elitist. When it fails to acknowledge the problematic—not to say grotesque—character of the present, it is unable to specify how men are kept underdeveloped by the dominant order of commitments: government by a plurality of elites, a functional division of labor, the distinction between private and public sectors, the system of fixed social and biological roles within hierarchical organizations, the market economy, the identification of security with military power, the achievement orientation, the separation of means from ends, and finally the organized repression of action and pleasure, of life and death, of politics and play.

There is so little doubt that these commitments and the institutions which implement them are functional—signs of good sense and maturity—that their explicit justification would seem to have become dispensable. Action to establish alternative realities is thus discredited without discussion: it is *a priori* "unrealistic"—unhinged from experienced reality. Moreover, authentic utopian speculation comes to be seen as irrelevant for scientific analysis. As frameworks for analysis scrupulously exclude unrealized norms, they are attached to the status quo, treating reactions to suffering or anxiety as malfunctions of existing systems—be they the systems of production, distribution, recreation, education, communication, transportation, law enforcement, riot control, medical service, prison management, welfare, or warfare.

That neither cost-benefit accounts nor systems analysis is inherently conservative would seem to be clear enough.[6] But what would be the practical consequence of attempts to overcome their present conservatism have hardly been acknowledged. True, it is noted that a sociocultural system should not be exhaustively identified with an equilibrium of interests; the equilibrium metaphor, it is recognized, fails to account for

[4] Wendell Bell and James A. Mau, "Images of the Future and Research Strategies," manuscript prepared for J. McKinney and E. Tiryakian (eds.), *Theoretical Sociology* (New York: Appleton-Century-Crofts, forthcoming), p. 7. The major premise of this essay is that "modern sociologists have so reified [technologies and organizational settings] that they have neglected the study of the processes involved in social development and change resulting from the actions of men themselves" (p. 34).

[5] Indictments of closure are legion. The charge is committing the fallacies of reductionism, misplaced concreteness, hypostatization, historicism, and essentialism. The record shows how readily science is converted into scientism, an analytical construct into an absolute, a useful tool into a fetish, or a contingency into a certainty.

[6] See Oran R. Young, *Systems of Political Science* (Englewood Cliffs, N.J.: Prentice-Hall, 1968).

man's creative response to tensions. Hence Walter Buckley, for example, has pointed to the need for "a new concept to express not only the *structure-maintaining* feature, but also the *structure-elaborating and changing* feature of the inherently unstable system."[7] He has consequently introduced the concept of "morphogenesis," quoting C. A. Mace's argument for extending the concept of homeostasis so that it might "cover the case in which the goal and/or norm is some state or relation which has never previously been experienced."[8] But this begs the question: how might social scientists remain loyal to their paradigm and express what has "never previously been experienced"? To what reality would their terms refer? How would they have to define reality so that their terms might acquire meaning? Would they not have to *create* experiences so as to come to terms with them, and would this not entail engaging in something more idealistic and hazardous—more active—than systems analysis as currently practiced?

The reluctance to face up to these questions is understandable. That social science should be inclined to maintain public morale and embrace established interests within self-maintaining structures should occasion no surprise: documentation of its readiness to serve is itself a minor industry.[9] If there is nonetheless a disciplined concern today with enlarging options by postulating the unity of theory and action—the inextricable linkage between fact and norm—we should not in any case expect to find it at the center of the social sciences. After all, such a concern would have to take the form of an attachment to potential interests which are all but eclipsed, which are present though invisible.[10] Attempts to represent unexpressed interests by bringing them into the light of day are bound to seem suspect to those who have the resources to see clearly and speak properly. The manners and idiom of spokesmen for the polarities of experience are unavoidably perceived as unseemly, if not incomprehensible. The utopias negatively implied or positively projected, for example, by Herbert Marcuse, Paul Goodman, Kenneth Burke, Wilhelm Reich, Francis Golffing, and Erich Fromm are seen to be irresponsibly conceptualized, expressed without regard for professional etiquette and scientific convention. Their metaphors fail to refer to manifest experience. Their works are out of order. Their vision, in Nietzsche's precise term, is untimely. Their prose discredits certified reality not only explicitly but also by its disconcerting ambiguity. Who can tell the genuine from the false prophet?

In view of these criticisms one can hardly blame either Marx or Wittgenstein (almost unthinkable company) for having declined to speak about worlds (and values) which had not been brought into being. And if their restraint is believed to be sensible, on what grounds can one entertain the desperate negations of Nietzsche, Heidegger, Merleau-Ponty, Marcel, Laing, or Mailer? Before accepting them, should one not wait until their prose has become more chaste and their posture less ambiguous?

Whether we are justified in rejecting efforts to communicate as unbearably eccentric, as pol-

itically irrelevant, must depend, however, on available resources. Can we bear to listen? Do we have the capacity for overcoming the manifest present, sustaining new forms of political consciousness, and surviving within an enlarged order of being? These questions may be seen as empirical ones: to what extent is it possible, in practice, to welcome a mode of action, of doing social science, which detaches men from prevailing social fortifications and empowers them to live life more fully? How far can men afford to dispense with the comfort provided by myth, ritual, religion, ideology, and consensus? Can men manage to act once they learn that nature gives no final answer, once they discover that its pervasive ambiguity frees them to choose the constraints which give significance to their lives?

It is easiest, of course, for us to support a view of man as capable of disciplining himself and of constructing his own reality when we insist at the same time that such a view is at best not fully implemented. Thus it has seemed advisable to keep protean man—why settle for less?—out of politics. Anyone who strives to negate the manifest present and design a new reality is accordingly confined to private life, the cultural arena, the realm of art. In private life (in life which some insist *is* private, or at least must be *kept* private) we can tolerate man's creative impulses. But out in the open where men do public business, some higher law—patented as a constitution—is alleged to be fixed and binding. Thus we follow Kant: we free the artist but confine the citizen—and along with the citizen the social scientist.

It may be useful to recall how the Kantian argument that we can have full confidence only in laws made by ourselves served to emancipate man as artist.[11] Prior to Kant, the artist had been confined: his role had been to sustain and illuminate the very nature of things. Expressing what he beheld, his works were to reflect the inherent order of the universe. Kant's *Critique of Pure Reason,* however, made it apparent that whatever order might inhere in the universe, it would surely remain mysterious. Man could no longer presume to say anything conclusively true about reality. He could merely make hypothetical statements—*and put them to the test.* Nature—or what those in power claimed to be nature—might now be made to yield. In the natural world, in what now could become *man's* world to the extent that he could impose on it, man could feel free to make the formulas, myths, designs, languages, ideologies, and laws that satisfied *his* needs. As generations of romantics beginning with Rousseau and the Marquis de Sade made plain, man was now authorized to express himself. The artist thus emerged, free to structure his feelings in the way he gave form to both his life and his work. Reality could be appropriated.

In practice, of course, the artist is kept from enlarging the sphere of his operations. His way is blocked by social prejudice, established institutions, political traditions, governing elites, and public opinion. He is confined to respectable enclaves: the gallery, the concert hall, the *salon,* the theater, the audience of well-bred connoisseurs. Plays are confined to stages, paintings are framed, performances have beginnings and endings. The arts are for special places and special hours, and access is restricted. Apparent exceptions—the decreative, boundary-breaking work of Joyce, Nabokov, Fellini, Borges, or Beckett; open-ended happenings; student rebellions and urban riots; strikes and demonstrations; marches of the poor—are simply not perceived as structured drama, as political projects which create meaning. Such performances are not seen as controlled efforts to break with actuality and display a new reality. It therefore simply does not occur to us that those who partake in them might be engaged in rational action. We fail to recognize that some outsiders might have discovered the theater of Antonin Artaud—not stages on which to resolve conflict and offer answers but stages on which to "express concretely certain secret truths, to bring into the light of day by means of active gestures certain aspects of truth that have been buried. . . ."[12] Failing to see this—failing to see that here might be "victims *signalling* through the flames"—we indiscriminately characterize annoying social events as reflexes, as outbreaks of lawlessness, irrationality, inhumanity, barbarism. They are out of bounds —mindless private usurpations of the public realm.[13]

[11] This paragraph draws on "Society as Crucible," in Helmut Schoeck and James W. Wiggins (eds.), *Psychiatry and Responsibility* (Princeton: D. Van Nostrand, 1962), pp. 135–156.

[12] Antonin Artaud, *The Theater and Its Double* (New York: Grove Press, 1958), p. 70. See also James L. Peacock, *Rites of Modernization: Symbolic and Social Aspects of Indonesian Proletarian Drama* (Chicago: University of Chicago Press, 1968); and Hugh D. Duncan, *Communication and Social Order* (Totawa, N.J.: Bedminster, 1962). Reuel Denney has pointed out to me the relevance of Artaud's conceptions.

[13] For examples of ambivalent concerns about the decline of good form, see Philip Rieff, *The Triumph of the Therapeutic* (New York: Harper

To become anxious about the artist breaking out and engaging in public action it is merely necessary to believe that the totalitarian regimes of the twentieth century were governed not by elites imposing their private visions but by the unleashed masses. The spectres of Nazi Germany or American McCarthyism—reinforced by data about working-class authoritarianism—are enough to inspire fear of the masses.[14] And once one confuses elite-governed regimes with mass society and identifies mass society with barbarism it becomes only sensible to deny public outlets for man's creative impulses. Culture then becomes quite literally private business, and pluralism and constitutionalism are celebrated as the last strongholds of civility. Thus the existing constitutional order—and the economy of motion and emotion it implicitly institutionalizes—emerges as the very embodiment of justice, as an unamendable achievement. It ceases to be regarded as relative to changing human needs, as a design for living which men might change when it obstructs their pursuit of happiness.

Policies, it is true, do continue to be made and unmade in the public sector of constitutional regimes: but it is doubtful that they appreciably affect those fundamental economic institutions which effectively govern the rhythm and texture, direction and quality of everyday existence.[15] Nor are the arenas in the private sector significantly open to political action. To be sure, all manner of men who have been blessed by luck and favorable tax laws may act creatively at the top of the hierarchies of private power. Moreover, scientists and scholars who have escaped scarcity and necessity may explore new space and play their serious games. But genuine latitude is granted only to the clearly identified, narrowly defined artist. Only he would seem to have room to maneuver, to express his enterpreneurial and creative impulses. Authorized to change the forms that constrain him, he above all others may approach convention, law, discipline, authority, or myth in a playful spirit, as forever subject to revision. He is permitted to treat the truly basic questions of style and form as hypothetical, as useful to the extent that they intensify and extend experience. Admittedly, his special sensibilities had initially impelled him to be alienated from the dominant culture. But while he had once rebelled against the bourgeoisie, today he has begun to accept its embraces. More than that, he has been returning the favor, utilizing commercial images and electronic products. Thus the private socio-economic order has been linked with that of art. It is only in the political realm—only in the realm in which man acts as citizen—that theory still denies us the power to create the plans, designs, and concepts to expand reality.

II

The case for extending the range of the artist's operations has hardly received a hearing. Theory may have cleared the ground for action. But it still does not allow for democratizing the impulse to manage one's experiences in public—the political impulse that was expressed at its highest pitch by Nietzsche. On the contrary, the political theory dominant today generally treats man as incapable of managing his interests and assumes a just political system to be one which will account for his allegedly inherent limitations.[16] Although political thinkers from Machiavelli to Kant provided foundations for public action, they never invited the masses to participate. Nietzsche, it is true, did take note of the conditions for self-government; yet he never explored how the mass of men might be enabled to meet these conditions. He failed to ask the question which was to be consistently posed by Dewey: what kind of educational system will enable men to detach themselves from the life-destructive structures of their society?[17]

The obvious strategy for moving ahead is to make *practical* inquiries about environments conducive to democratizing creativity, to expanding politics. This entails raising empirical questions which, because they must be answered

[17] Marx, of course, posed this question, but his idiom has been more difficult to Americanize.

experimentally, compel social science to emerge as a form of action. It entails a commitment to an active, creative social science—a *political* science—for widening the scope of publicly controlled experience, for increasing the time and enlarging the space for political life. Reducing self-destructive privacy, it would extend man's various deadlines.

The extent to which social science offers practical demonstrations of the feasibility of democratizing creativity is not readily apparent, for the motives of social scientists are mixed and their work is accordingly ambiguous. Admittedly, the point of some scientific projects has not been obscure: behavioralists have been recurrently pleased to instruct men in power how to manipulate consumers, employees, patients, television viewers, prisoners, students, and rebellious populations.[18] Their very prose style has closed alternatives as they unambiguously defined deviants, reified existing systems, or converted their hypotheses into finalities. In their grading system, the most shameful grade is "Incomplete." Yet opportunism, impatience, and the will to settle things have not been the whole of contemporary social science. Social science has also shown itself capable of remaining experimental, of designing prototypes and constructing social laboratories—whether in hospitals, corporations, prisons, schools, or ghettos.[19] In 1955 Harold Lasswell became explicit about the need to build more bridges "between laboratory situations and field situations, . . . to take the laboratory design into the field and apply it to a whole community context." The community—transformed into a laboratory—may
then be explored more intensively in order to identify the variables that account for the deviation. This can be done by applying more laboratory-type measures at the proper spots and by instituting a program of 'probers,' 'pre-tests,' 'interventions,' and 'appraisals.'[20]

[18] For early examples, see T. N. Whitehead, *The Industrial Worker* (Cambridge: Harvard University Press, 1938); Alexander H. Leighton, *The Governing of Men* (Princeton: Princeton University Press, 1945); and Schuyler Dean Hoslett (ed.), *Human Factors in Management* (New York: Harper, 1946).

[19] Harold D. Lasswell, "Current Studies of the Decision Process: Automation versus Creativity," *Western Political Quarterly,* 8 (September, 1955), 385–386.

[20] See especially Robert Rubenstein and Harold D. Lasswell, *The Sharing of Power in a Psychiatric Hospital* (New Haven: Yale University Press, 1966); and the research strategy advocated by Bell and Mau, *op. cit.*

Progressively expanding its laboratories, the social sciences may thus become openly activitistic.

No less radically, they may also consider the value of a phenomenological orientation which seeks to give recognition to repressed parts of the present—to causes which are latent, unpopular, discredited, or lost. Turning to more of the present than is immediately apparent, they can work toward its fullest possible realization. Cutting beneath prevailing simplifications, they can attempt to give creditable accounts of political potentialities, truly simulating by treating nothing as necessary or real.

Given the pressure to reduce intolerable ambiguities and dissonances, we are of course not disposed to add to life's complications. On the contrary, we are moved to seek relationships, solve problems, and explain political acts by functionalizing them. Yet only when we succeed in suspending our causal analyses and explanatory theories can we perceive the unconditional, innovative, and self-determined aspect of human conduct. Only when we decline to judge and draw conclusions can we discern the expressive element of politics, the display of capacities not ordinarily displayed, or not ordinarily displayed with as much grace or intensity.

To perceive this expressive aspect of experience, we need merely follow the clues of Hannah Arendt and conceptualize political action as a form of play, as characteristically a performing art. When politics is conceptualized in these terms—as something more than a struggle for power to allocate values in short supply—it will not be seen as a function of scarcity. From a phenomenological perspective, it emerges as a manifestation of human freedom, of the determination to use abundant resources to create publicly meaningful structures of being—whether these are demonstrations, research designs, urban redevelopment programs, war games, election campaigns, or entire political systems. Should we wish to understand the way action signifies the presence of ordinarily unrealized structures of being, we cannot regard it as conclusively significant in any other sense—in the sense, for example, of "really" signifying some predefined intention or of being "really" functional to some predefined structure. We must see it as a form of play: *complete in itself.*

The obstacles to applying this orientation to the normal subject matter of political science are considerable. Political scientists whose scope-and-methods courses orginally led them to invest in a definition of politics as economizing behavior are bound to become troubled. It is certainly more conventional (and for some purposes more useful) to view so-called voting be-

havior, for instance, from non-phenomenological perspectives. We may explain it as a function of group membership, as a conditioned response to economic deprivation, or as determined by income level. Or we may interpret it as a gesture intended to influence policy. But to understand it as a form of action, it must be perceived as no more (and no less) than the manifestation of man's desire to appear in public and display his freedom. Such a display, we must acknowledge, proclaims the sheer determination to act, the will of an individual to appear, to *be*. It is hardly surprising, on reflection, that social scientists or men in power should have difficulties seeing this determination in others. The self-assertiveness of outsiders is bound to strike the powerful either as not really intended or as inexplicably arrogant, especially when the resources for effective political action are believed to be scarce. When individuals make their appearance—freeing themselves from necessity—elites readily characterize their emergence as an emergency. But social scientists might be slower to judge, slower to characterize behavior as dysfunctional, recognizing that the behavior of the less privileged, less active orders of society may at least partially be a form of action.

Although political acts can no more be explained scientifically than the will to survive, they may nevertheless be elucidated. While not regarding them as useful or necessary or instrumental, as intended to make an impression or to teach a lesson, as being *for* anything, the social scientist can yet describe their distinctive modes and structures. He can yet communicate his understanding of them (as Lévi-Strauss did in *The Raw and the Cooked* or Norman Mailer in *Armies of the Night*), translating them so that his exposition will reveal not *what* they signify but the *way* they signify. His model is provided by the German critic Walter Benjamin: "A translation, instead of resembling the meaning of the original, must lovingly and in detail incorporate the original's mode of significance, thus making *both* the original and the translation recognizable as fragments of a greater language. . . ."[21] Making us aware of a "greater language"—of a larger symbolic universe than we conventionally recognize—the writer can convey what a political act *is*. And what it is, he can make clear, is a distinctive way of existing, of resisting necessity, of converting absurdities into meaningful reality. Thus the social scientist as translator can publicly ponder and implicitly exalt the sheer appearance of political life—the inexplicable fact that it is present at all.

[21] Walter Benjamin, *Illuminations*, Harry Zohn, tr. (New York: Harcourt, Brace & World, 1968), p. 78; italics supplied.

If his literary act fails to "explain," it nonetheless establishes reality for others as well as himself. Seeking to come to terms with man as self-directed agent, with expressive aspects of behavior, he assumes that his accounts must be idiographic and ambiguous, that the very concept of explanation, as John Gunnell has said, is "context-bound and field-dependent."[22] One test of his success is his capacity for deepening our understanding of men who make their way outside accredited systems, who act in incongruous situations and unfamiliar environments: marching on the Pentagon, growing up in a kibbutz, serving on workers' councils, participating in utopian communities, playing unorthodox roles, or gaining balance in psychoanalytic encounters. A less orthodox test of such a political science is the extent of its impact on those it presumes to understand. It succeeds to the extent that it enables them to recognize more of themselves than they ordinarily recognize, that it raises their expectations, that it expands their consciousness, freeing them to be more playful and political, more active and alive. Perhaps the ultimate test is its impact on the political scientist himself, even if only he can finally tell whether his symbolic action—his contribution to a journal, his lecture, his public performance—has added, not merely to his *curriculum vitae*, but to his life.

In any case, such a political science serves to amplify and enlarge our existence by illuminating previously invisible, generally discredited dimensions. Bringing apparent exceptions into our symbolic frameworks, it demonstrates how little (or how much) discipline is necessary to satisfy human needs under varying conditions. It makes clear, for instance, that however unavoidable social differentiation may be, a system of social stratification is dispensable, that "there is nothing demonstrably 'natural,'" as Melvin Tumin has shown, "about reacting to differential skills in the ways generally found in modern industrial societies."[23] Though the rhetoric of such a polit-

See also how role differentiation, social stratification, and status inequality are avoided in kibbutzim: Richard D. Schwartz, "Functional Alternatives to Inequality," *American Sociological Review*, 20 (August, 1955), 424–430. Arnold Gehlen's work shows that no specific social order is prescribed by nature: *Der Mensch, seine Natur und seine Stellung in der Welt* (Bonn: Athenäum Verlag, 1950); *Urmensch und Spätkultur* (Bonn: Athenäum Verlag, 1956).

ical science is different from that of history, fiction, films, or psychological case studies, it no less reveals man's capacity for role-taking and role-switching, for escaping the assignments hierarchical organizations seem to demand.[24]

As they open alternatives, the social sciences necessarily follow Reinhard Bendix's advice to raise questions, as he says,

> contrary to the manifest evidence in order to bring out those capacities of the social structure which any limited body of evidence tends to omit. By exposing observation at any one time to a wider range of comparison with the past (or with other social structures) than is sometimes customary, we may approach an understanding of social structure and change without at the same time moving too far away from the evidence.[25]

By giving credence to past or distant or unfashionable life styles—to modes of conduct which are *possible* though regarded as failures—the social sciences reverse conventional valuations of goals. Valuing the needs of the child over those of the existing school or, as Chris Argyris has done,[26] the needs of the worker over those of the organization, they introduce options. Positing countervailing values, they enlarge understanding. By engendering a growth in empathy toward modes of action intimated but not clearly expressed by extremist movements, they induce a deliberate shifting in point of view—a rejection of the study of outsiders from the established center, an acceptance of men who are active at the margin.[27]

Whether the social scientist is engaged in experimental prototyping or in expressing his understanding of political acts in phenomenological accounts, he remains in touch with his subject matter, treating it not as an object to be acted upon but as phenomena with which to interact. His involvement entails suspension of that subject-object distinction which leads social scientists to disregard unexpressed potentialities and deal with people as if, like objects, they had no political will of their own.[28] It entails approaching society with an attitude of receptivity to the claims of its members, with an artful, simulated readiness to reinforce them, to go along with them, to say forcefully what they say haltingly.[29]

Offering actual demonstrations of the possibility of revolution, this approach leads to a restructured, transformed reality. While it displays options in altogether practical terms, it does not provide inventories of definitive propositions. It therefore should not lead us to expect what students in the social sciences are generally taught to produce—findings, conclusions, information, or general theories. Prepared to be less goal oriented, we can merely expect (it has become hard to say so) a measure of wisdom—an increase in self-conscious empathy, in managed compassion and governed openness.[30] Thus successful social experiments as well as the writings of phenomenologists can scarcely serve to provide knowledge (or even "insight"). They merely draw us into a process of discovery which enables us to grasp what we tacitly know but fail to acknowledge—namely, that more of life might be lived rationally. Rejecting the reified abstractions of Social Science as well as the homilies of Wisdom Literature, they compel us to accept only what cannot be mastered by human action. Ideally, they then leave man to himself, but to more of himself than he knew was his before the social sciences engaged him. "A child may feel hungry and not know that it wants to eat, until it is offered food," Michael Polanyi has noted[31]—implying that the probing of social analysts exposes repressed needs and incites action simply by putting man's immediate responses into question. A science which thus challenges the present by adducing unestablished dimensions of reality assumes not that men are ignorant but that they are burdened by an excess of insinuating knowledge, by elite-

[28] See *ibid.* and works cited in note 18, *supra*.

[29] For a lucid discussion of gaining knowledge through empathic activity, see Edwin A. Burtt, *In Search of Philosophic Understanding* (New York: New American Library, 1965), Ch. 9.

[30] To recognize this may reveal the pathos in efforts to make public administration cases yield general propositions: Frederick C. Mosher (ed.), *Governmental Reorganizations: Cases and Commentaries* (Indianapolis: Bobbs-Merrill, 1967). Of course, cases may make the student sensitive to the complexity of administrative processes; to claim more, however, is to succumb to scientism.

[31] Michael Polanyi, *Personal Knowledge: Towards a Post-Critical Philosophy* (London: Routledge & Kegan Paul, 1958), p. 202.

serving solutions, by needless words and theories —in short, by ideologies. Consequently writers such as Mead or Sartre or Dewey have always fought the temptation of offering answers. Refusing to simplify our lives, they have deepened our predicaments. But if the studied emptiness of their work is annoying, it does free us to provide answers for ourselves, to construct our own futures now, to revolt and make history.

III

Short of efforts to vacate our practical and theoretical edifices and to invite men to move in and establish themselves—short of efforts to annihilate and reconstruct reality—we cannot possibly perceive the defeats implicit in the various offered projections of our present victories. The most precise cost-benefit accounting or the most elegant exercises in futuristics cannot expand the present as long as their designers simply acquiesce in the Facts of the Situation, the Inner Logic of Industrialism, or the Natural Laws of Organizational Development. Without an idealistic orientation which, by alerting us to deranged and disorderly interests, serves to enlarge the center, we are bound to let our present achievements become permanent fixations. We thereby allow ourselves to be arrested in our development simultaneously as citizens and social scientists. True, while arrested we would, like prisoners, still sense the passage of time. But we would have no future. We would have lost the opportunity for giving time publically significant meaning, for politicalizing it.

When social scientists succeed in being creative in each present moment, destroying meaningless time by acting, they deprive the prevailing concept of "the future" of its current ideological value: they thereby make it serve more than the established present reality. De-emphasizing planning and prediction (both functions of scarcity and insecurity), questioning pre-ordained sequences and breaking continuities, they multiply realities and keep progressively more of them in a state of suspense. As social scientists induce the mass of men to let go, to find release from the merely contemporary objectification of time, they disregard the sense of time within which elites find it profitable to imprison others.

So far, it is true, only elites have been able to live for the moment and to make the most of it.[32] But it is possible to test experimentally whether others, too, might bear the freedom to impose alternative meanings on history. Encouraged to defy the linear predictions of the new utopianism, more men may be able to identify concealed political potentialities; given the power to make more of the present, they may be able to let more of the future take care of itself. As they become aware of the openness of the future—cherishing its emptiness, its mystery —they might learn to dispense with some of their defense mechanisms, to repudiate timeless reifications, and to create unanticipated, still disreputable realms of being.

[32] Robert Jay Lifton has suggested that the mass of men lack tolerance of a variegated present and consequently crave connections with the future because of a pervasive fear of death, and that this in turn generates an interest in progeny, an obsession with durable achievements, and a devotion to undying causes and death-defying leaders: *Revolutionary Immortality: Mao Tse-Tung and the Chinese Cultural Revolution* (New York: Random House, 1968).

PRISONERS OF WAR: DOES THE FIGHT CONTINUE AFTER THE BATTLE?

MICHAEL WALZER
Harvard University

I. REFUGEES AND PRISONERS OF WAR

Just beyond the state there is a kind of limbo, a strange world this side of the hell of war, whose members are deprived of the relative security of political or social membership. Different sorts of people live there, mostly for indefinite periods of time, people who have been expelled from their state or otherwise deprived of legal rights, people whose state has been defeated in war and occupied or who have been separated somehow from its jurisdiction. Among the residents, two groups endure conditions paradigmatic for all the others: refugees, deprived of their rights by persecution; and prisoners of war, separated from their state by captivity. The two are very different, since refugees are stateless persons, radically dependent on their hosts and unable to look backward to any protecting authority, while prisoners remain citizens still and receive such protection as their states can provide. However distant and isolated they may be from their home country, their captivity is (hopefully) temporary; both captives and captors may one day be required to account for their behavior. Nevertheless, prisoners and refugees belong alike to the limbo world. They cannot expect effective help from any organized society; they do not know when, if ever, they will be "at home" again; they are compelled to reconstruct or redefine their obligations without reference, or without clearcut reference, to authoritative laws and commands.

Refugees face their hosts with a special kind of helplessness and pathos, but also with an unaccountable and peculiar freedom. They are men free of all allegiance except to other men, without political obligations, at least without obligations to any state in the world of states. And their condition testifies to the wretchedness of such freedom.[1] Frightening as it may be to the authorities (at least, the authorities generally profess to be frightened), it is far more so to the refugees themselves. Until they are given a home, they have a right to do whatever they can to save themselves, within limits imposed only by their humanity and the relations they form with particular other people. But in fact they can do painfully little, and theirs is a freedom any of us would speedily exchange for membership and protection, despite the restraints these impose. The value of the state as an inclusive community, the importance of even the most minimal kinds of social solidarity and legal definition—these are never more clear than when we regard ourselves as possible participants in the limbo of statelessness.

The prisoner, on the other hand, is doubly unfree, since he is not set loose from his former allegiance, or so he is told, by his captivity. If he is forced to face his captors, bound or at gunpoint, he must also look over his shoulder to the authorities of his own state. He is required continually to balance the obligations he knows he once had, and may still have, as a citizen and soldier, against the more immediate threats and coercions of his captors—and perhaps also against his new obligations to the society of prisoners. What should he do? It is never easy to say. If the statelessness of a refugee is frightening, so is the citizenship of a prisoner of war. To regard ourselves as possible captives is to learn how oppressive political obligations can be. Even limbo, as we shall see, has its temptations.

II. THE CONDITION OF PRISONERS OF WAR

Captivity can be conceived in two different ways: first, as the termination of combat for an individual soldier, the imposition by the captor and the acceptance by the captive, of a total quarantine for the duration of the war; secondly, as the termination of one sort of combat and its replacement by another sort, where the fighting is relatively circumscribed and its conditions radically unequal.[2] Both of these are modern conceptions; both depend on the recognition of the prisoner as a moral and legal person, possessed of certain rights, entitled at the very least to be kept and provided for by what the lawyers call "the detaining power." The

[1] For a brilliant discussion of the problem of statelessness, see Hannah Arendt, *The Origins of Totalitarianism* (New York, 1958), Ch. 9.

[2] See G. S. Pugh, "Prisoners at War: The P.O.W. Battleground," 60 *Dickenson Law Review* 123–138 (1956), and "The Code of Conduct," 56 *Columbia Law Review* 678–707 (1956). The best book on the nature and laws of captivity is William E. S. Flory, *Prisoners of War: A Study in the Development of International Law* (Washington, 1942).

prisoner is "detained," and that means that whatever else is done to him or with him during his detention, he cannot be killed or enslaved. Not so very long ago, a prisoner was thought to have forfeited his life by his surrender. Then his slavery was justified as the end result of an exchange made possible solely by the benevolence of his captor, an exchange of life for perpetual service. On that view, captivity was in no sense a status within which a man might be more or less secure even if impotent. Prisoners were rapidly converted into dead men or living slaves, and the choice between these two conditions was only secondarily their own.[3] (In practice, during the early modern period, prisoners were often required simply to join the army of their captors, common soldiers being little more than chattel anyway.) Today, a prisoner can expect to remain a prisoner for as long as the war lasts, and then he can expect to be released. In the interim between capture and release, he is forced into a relation with his captors unlike that of slave and master, though not entirely unlike it, and into a relation with his fellow prisoners unlike that of any normal political (or military) association. The prison or prison camp is the scene of a new society, which exists precariously in the shadow of the detaining power and whose members feel the pull of their previous political commitments, not least because these are likely to be their future commitments as well.

This new society of prisoners exists by virtue of, or at least in accordance with, international law. Its members have even been called, by a serene theorist of the nineteenth century, "citizens of the world."[4] The world is, unfortunately, not so organized that citizenship in it is much of a benefit—as stateless persons have learned over and over again in the past 30 years. But the name does serve to suggest something very important, if true: that prisoners are no longer at war. It presses us toward the first of the two conceptions of captivity. For the war is being fought by citizens of this state and of that one, and citizens of the world, even if they hold dual citizenship in one of the belligerent states, are presumably exempt from the compulsions of the struggle. The rules of quarantine replace the code of battle, and this replacement is not merely legal, but moral as well; it frees the prisoner from all obligations to continue the war.

The same replacement would seem to be implied by the conventional practice of "surrendering" or "giving up," though this has sometimes been denied. In the *Code of Conduct* for US soldiers issued by President Eisenhower in 1955, it is said that soldiers must never surrender "of their own free will."[5] If it were possible for soldiers to surrender in any other way, the act might indeed have no moral consequences. But unless the *Code* is intended to bar surrender altogether—and then its subsequent provisions, which deal with the conduct of prisoners, would be superfluous—the phrase "of their own free will" is very odd. The authors presumably want to say that only extreme duress and the threat of imminent death are acceptable reasons for surrender, but that does not mean that the act of surrendering can never be a decision of the men who surrender or an agreement between them and their captors.[6] It most often is a deci-

[3] Hugo Grotius, writing in the early seventeenth century, still defended the right of enslavement, *De Jure Belli ac Pacis,* Book III, Chapter 14, Section 9. The decisive theoretical critiques of this idea are by Montesquieu, *The Spirit of the Laws,* Book IV, Chapter 2, and Rousseau, *The Social Contract,* Book I, Chapter 4.

[4] James Lorimer, *Institutes of the Law of Nations* (London, 1884), Volume II, p. 72. The whole passage is excellent and should be consulted.

[5] The *Code of Conduct* is the most important official statement on how U.S. soldiers are to behave when overpowered by an enemy, and I will refer to it frequently below. At the time it was issued, its legal status was unclear (see Pugh, "The Code of Conduct"), but it has recently been described, in the aftermath of the *Pueblo* incident, as "only a guideline." Violations of the articles of the *Code* do not constitute a criminal offense: *New York Times,* December 29, 1968. It is presumably still the opinion of the authorities that they constitute a moral offense, and the *Code* continues to play a very important part in the training of US soldiers.

[6] Something must be said here about the difficult problem of coercion, though to deal with it in even a minimally adequate way would require another essay. The common and plausible view is that no man is morally bound to fulfill a contract or commitment he was coerced into making. Since the word "coerced" is usually taken to mean "forced by violence or the threat of violence," surrender would appear to have no moral validity. But it might be argued against this that the definition of coercion depends or ought to depend on the situation of the individual said to be coerced, and that in the context of war, violence exercised in accordance with the laws of war is not coercive. Surrender is a social practice designed to accommodate the human difficulties of war; it can't be judged by conventions appropriate to other, and very different, settings. This calls into question the dictionary definition and ordinary usage of the word "coercion." But there are only two alternatives, neither

sion, and it is probably always an (implicit) agreement. Even when no decision seems possible, as when the sailors of a sunken ship are simultaneously rescued and captured, it can probably be assumed that the prisoners agree to their captivity, if only for the sake of their rescue, and that they approve of the general practice of taking prisoners. In battle or in the aftermath of battle, surrender usually involves a more explicit judgement and choice on the part of the men surrendering, a judgement of their own continuing effectiveness as soldiers and of the risks they face, a choice to fight on or not. And this is in some sense a free choice, though it is made under varying degrees of duress, since soldiers can and have been known to accept enormous risks and even fight to the death. Surrender is precisely a way of choosing not to take enormous risks and not to fight to the death. It takes the conventional form of an agreement not to fight at all, to "give up" fighting, in return for life itself and then benevolent quarantine.

This agreement obviously requires a second party; surrender must be accepted as well as offered, and armies can refuse, though no longer lawfully, to take prisoners. Clearly, there would be a positive incentive to refuse if surrender were thought to involve no commitment to cease (and not to resume) fighting, just as there would be a positive incentive to fight to the death if the acceptance of surrender were not viewed as a commitment to one or another form of quarantine. Surrender as a social practice is only possible in the absence of these two incentives, that is, it is only possible when it is conceived as a mutual engagement with moral consequences. This conception is clearly reflected in international law, which requires benevolence of captors and simultaneously deprives a prisoner of all combatant rights.[7] If he kills a prison guard, for example, the act is murder and not war, for he has given up fighting and thereby reassumed some of those civilian obligations which are suspended for soldiers in the face of an enemy.

The essence of surrender is the agreement not to fight, and this agreement may not require quarantine at all. In the days when officers were also gentlemen and aristocrats, it was perfectly normal to release a prisoner on parole, that is, to accept his word that he would not rejoin the fighting and then to permit him personal freedom of movement, even to permit him to go home. This is only possible on a very strict view of surrender, which holds the captives temporarily free of political allegiance and so able to make arrangements on their own behalf: "separated for the time being from any political community, they . . . belong to humanity and to themselves."[8] Eighteenth and nineteenth century lawyers argued—and their arguments were for a time widely accepted—that if a prisoner did return home on parole, his home state could not force him to fight again or in any way require him to violate his faith.[9] This clearly implies that the prisoner did not break faith when he gave parole in the first place; it grants that he belonged at that moment in time "to himself." Perhaps that is a status which aristocrats resume more readily than other men; nevertheless, its recognition is, I think, an extraordinary tribute to the liberality of eighteenth and nineteenth century states, or of some of them, and of their lawyers and philosophers. Modern states, whether liberal or not, are not inclined to grant a similar recognition. Most of them, including the United States, deny prisoners the right to give their parole (except under very restricted circumstances and for short periods of time). International law has been adjusted so as to deny validity to any parole arrangement contrary to the laws or regulations of the prisoner's home state.[10] Very occasionally the old ethic is rediscovered. Thus, a small number of captured American soldiers gave their parole to the Japanese in the Philippines during World War II, and "these paroles were recognized by the US as prohibiting military and other resistance to the Japanese on the part of the individuals concerned."[11] But such agreements are rare in this century and today the *Code of Conduct* explicitly declares that prisoners must not give their parole to their captors. Prisoners, it would appear, never belong, or are never admitted to belong, merely "to humanity and to themselves."

It is perfectly understandable that the state should continue to claim the allegiance and sup-

of them attractive: either to suggest that no morally binding agreements are possible in wartime, or to accept Hobbes' argument that "Covenants entered into by fear . . . are obligatory" (an argument Hobbes explicitly applied to prisoners of war—see *Leviathan*, Chapter XIV).

port of prisoners. It is even in the interests of the prisoners that it should do so—up to a point. They have no wish to be abandoned, however uneasy they may be about their "obligations." Nor does the state make its claims very effectively, since it has no immediate control over the persons of the prisoners and is unable to offer any but the most minimal guidance as to their everyday behavior in the radically new society of the prison camp. The claims of the state are still enormously important; they point toward the second and at present (in this country and more clearly in some others) the official view of the status of captives and the moral meaning of captivity. On this view, prisoners of war must regard themselves as combatants even after their capture, full-fledged members of a state at war, a state in trouble, needful of all the men it has, unwilling to yield the services of anyone except to death itself. The prisoner, so the *Code of Conduct* tells him, is an "American fighting man" (Article I). He must refuse any sort of cooperation with his captors and seek continually to escape. By implication, he must also help whenever he can to organize mass escapes, to maintain a resistance network in the camp, to harrass the enemy, spy on him and sabotage his behind-the-lines operations. He must always act so as to require as many guards as possible. It is a little hard to see why any state at war would maintain prisoners who actually did or tried to do all these things, and insofar as the *Code* requires them, it is not entirely consistent with the idea of benevolent quarantine. This is partly because it was designed as a response to North Korean and Chinese captors who paid little regard to that idea, but it also reflects, as did the actions of the North Koreans and Chinese, an extension of state sovereignty and an attempt at ideological control which amount to a denial that individuals can ever move, even partially, out of the range of political action and supervision. There simply is no space, it suggests, that might be called limbo, where quarantine is possible and a certain human passivity morally justified.

Contemporary international law, as codified in the Geneva Conventions (1949), does not require the passivity of prisoners; indeed, it provides carefully and at considerable length for attempted escapes, though not for any other kind of resistance.[12] But it is not unfair to argue that the most humane provisions of the present code —for example, the rule that prisoners captured while trying to escape cannot be punished, but only detained more strictly, and that only for a short time—are rooted in the expectation that the vast majority of prisoners will not resume or make any attempt to resume their combatant roles. And that is an expectation most often realized in practice, despite the wishes of the governments whose citizens are imprisoned. The erosion of the idea of benevolent quarantine has come largely from the other side, from captors and not from captives, as one might expect; for if combat is resumed, it is the captors who have every advantage. Still, prisoners have chosen to fight on, sometimes in response to the coercive acts of the enemy, sometimes on their own initiative, and it is worth asking whether there is any justice at all in the increasingly strong presumption of their home states that they ought to do so.

Article III of the US *Code of Conduct* requires that American soldiers, if captured, must "continue to resist by all means available." This is its most extreme provision, though the ambiguous word "resist" was carefully chosen. Mr. Carter Burgess, Assistant Secretary of Defense, argued at the time the *Code* was adopted that physical resistance (which is barred by Geneva Convention I, article 82) was not required of prisoners, but only mental resistance to political indoctrination.[13] That is hardly made clear by the *Code* itself, and the lack of clarity was presumably intentional, since the wording was long debated. One legal critic of the *Code* has pointed out that unless it is read as a call for resistance "by all *legitimate* means available," prisoners "would be encouraged to commit acts that may be war crimes or at least contrary to the spirit of the Geneva Conventions."[14] Needless to say, their captors would be similarly encouraged.

The *Code* was adopted in the immediate aftermath of the Korean War, a struggle in which the noncombatant status of prisoners was undermined by both sides, though most dangerously and cruelly, judging from the available evidence, by the North Koreans and Chinese.[15] In prison camps north and south of the battleline, a new kind of war went on for the minds, that is, for the loyalty and political commitment, of the prisoners. To some extent, this was a war that could be fought within the limits set by the Geneva Conventions. But one of its most ominous results was that in the American-run camps, where the Conventions were fairly rigorously observed, and in contrast to the Commu-

nist camps where they were not, resistance was amazingly successful. At one point, major sections of the camp on Koje Island were entirely controlled by North Korean prisoners, who even captured and for several days held the American commander of the camp. It quickly became clear that "measures permitted under the Geneva Conventions would not completely destroy the Communist organization within the compounds." The North Korean prisoners could no longer be regarded, or treated, "as passive human beings in need of care and protection. . . ."[16]

General Mark Clark's comment on the Koje mutiny suggests what American officials learned from this incident: ". . . my experience," he wrote, "had been with *old-fashioned* wars in which prisoners were people to be fed, housed, clothed, and guarded, nothing more. Never had I experienced a situation in which prisoners remained combatants and carried out orders smuggled to them from the enemy high command."[17] Only a few years later President Eisenhower brought American policies up to date by issuing the *Code of Conduct*, recommended to him in a Defense Department report entitled "P.O.W.—The Fight Continues After the Battle."[18] The *Code* was explicitly intended to provide a secure moral basis for resistance to the indoctrination of prisoners as this had been practiced by the North Koreans and Chinese. But its careful ambiguity suggests that it was also intended to encourage action on the scale of the Koje mutiny. What happens then to the "old-fashioned" notion that prisoners must be maintained and guarded and nothing more? Surely there would be some value in reiterating that notion, rather than merely conceding its antiquity.

III. OBLIGATIONS AND FORMS OF RESISTANCE

On the other hand, when serious pressure is put on prisoners to collaborate with the enemy, either by supplying military information or expressions of political support, we do want "our" soldiers (at least) to refuse and resist. It is important to understand just what is involved in such refusals: they don't represent a continuation of the war so much as an unwillingness to enlist or be enlisted on the other side; they are a defense of all that is implied by the idea of quarantine. Prisoners refusing to collaborate are also, of course, refusing to "sell out" their comrades or their recent comrades and to betray their country. But the obligations which they thus acknowledge and sustain are minimal in character. They can most readily be expressed in the negative: not to inform, not to confess, not to collaborate, and so on. I don't mean to suggest that they are for that reason easy to sustain. Whether they are easy or hard (or impossible) to sustain depends on the actions of the enemy. They are significantly different, however, from obligations that lend themselves to positive statement: to try to escape, to harrass, to sabotage, and so on. In practice, most states attempt legal enforcement only of negative obligations. Prisoners who collaborate with the enemy may be charged after the war with misconduct or even with treason, but not prisoners who refuse to join escape organizations.[19] Treason obviously requires some overt act of "aid and comfort," so mere refusals to participate in escape or harrassment attempts don't qualify. But the inability and unwillingness of states to enforce positive obligations has other reasons, which call into question their very status as obligations.

Negative and positive obligations (I mean the two adjectives merely as rough indications of certain sorts of actions and refusals to act) are mediated very differently to the individual soldier. Negative obligations are his as an individual, a member, let us assume a willing member, of a particular state or of its army, and they clearly survive temporary separation from either. In captivity (as out of it) these obligations may be over-ridden, or they may be violated in extenuating circumstances. Refusals to collaborate, for example, may endanger the society of prisoners as a whole or some of its individual members, and then the man who is being pressed to perform this or that service must weigh relative evils and make a difficult and painful decision. It is important to stress the word "must," for whatever decision he comes to, he is faithful only if he takes into account his obligation not to act so as to injure his country or endanger his comrades-in-arms.

Similarly, in those cases where a prisoner collaborates under duress, he is later judged, and

[16] Pugh, "Prisoners at War," citing UN Command Reports, p. 131. A complete account of the Koje mutiny, from the American point of view, can be found in Hal Vetter, *Mutiny on Koje Island* (Tokyo, 1965).

[17] Quoted in Vetter, *Mutiny*, p. 10 (emphasis added).

[18] Report by the Secretary of Defense's Advisory Committee on Prisoners of War, August, 1955.

[19] Rebecca West reports on the trials of several British prisoners of war for treason in *The Meaning of Treason* (London, 1947). For a complete review of judicial treatment of prisoner misconduct, see "Misconduct in the Prison Camp: A Survey of the Law and an Analysis of the Korean Cases," 56 *Columbia Law Review* 709–794 (1956).

rightly so, by the integrity of his resistance as long as it lasts, that is, by his own manifest sense of his obligations. I cannot say, and I am not sure any free man can say, what constitutes an adequate manifestation.[20] Once a prisoner has done what he can on behalf of his home state, by refusal, evasion, or deceit, and can resist no more, his fellow citizens can only mourn with him, and not condemn, the disloyal or degrading acts he is driven to perform. Some manifestation of resistance there must be, however, so long as the prisoner regards himself and hopes to be regarded as a citizen. Negative obligations survive every separation except explicit renunciation, which is only possible under certain conditions and which terminates citizenship. They are paralleled, it should be added, by the obligations of the home state to provide protection whenever it can, to protest every breach of the rules and agreements that make for benevolent quarantine, and to do nothing and demand nothing of its soldiers that might prompt or seem to excuse the coercion of prisoners.

Positive obligations belong to the individual as one of a group of citizens or soldiers. This can be a group of conscripts, whose members are designated as falling under one or another law or legitimate command, or a group of volunteers mutually engaged in some enterprise of value to the larger society. It seems most unlikely, in either case, that positive obligations survive clear-cut (even if temporary) separation from the group. The prisoner is alone and on his own, or he is the member of a new society, and while he remains in an important sense a citizen, he can no longer be regarded as a servant of the state. For he is cut off from the group support and organizational structure that once made his service possible. Positive obligations can be reinstated by joining an escape organization or a resistance network in the prison camp. But such reinstatements are actually commitments to a new group, and the precise relation of the new group to the larger society, the state or the army, is radically unclear. It seems unlikely that the state's right to conscript, for example, can ever devolve to an association of prisoners, though such groups have sometimes claimed that right. A kind of rough and ready conscription may, of course, be effective in a camp where an escape organization has widespread support. There are many examples of this sort of thing in prison camp literature: certain kinds of minor helpfulness have often been required of prisoners who have no personal interest in escaping. It is less their patriotism that one appeals to at such moments, however, than their loyalty to fellow prisoners.

This appeal to the others may or may not be successful. That will depend on the nature of the society of prisoners as a whole (which may in turn depend on the nature of the state and army from which the prisoners come) or on the character of the personal relations involved. But it is clear that no prisoner has a positive obligation *to the state or army* to work and take risks for the escape of himself and others or for the harrassment of the enemy. Unless he actually commits himself to such purposes, he has what must be called a perfect right to "enjoy" his quarantine and to sit out the war—so long as doing so involves no conflict with his other obligations.

There are obligations, however, in addition to those positive and negative duties owed or said to be owed to the state, despite the prisoner's separation from the state. Captivity is not only a separation; it also brings men together and does so under conditions that make their cooperation both vitally necessary and extremely difficult. It can't accurately be said that anyone joins the society of prisoners willingly, even though there is a sense, as I've already argued, in which their surrender is a voluntary act. But that society can be organized on a consensual basis, and probably ought to be, either by intelligent officers who recognize that their own authority survives in a tenuous way, if at all, or, in the absence of officers and in accordance with the Geneva Conventions' provisions for enlisted

[20] The courts must say something, however, and what they have said is discussed in "Coercion: A Defense to Misconduct while a Prisoner of War," 29 *Indiana Law Journal* 603-621 (1954). In passing judgment on prisoners who have given military information, it is worth noting the finding of army experts after World War II: "It is virtually impossible for anyone to resist a determined interrogator." Cited in "P.O.W.—The Fight Continues After the Battle," p. 61. For a full discussion of this problem, see Albert D. Biderman's careful study of the behavior of American prisoners in Korea, *March to Calumny* (New York, 1963).

The whole question has recently been reopened because of the *Pueblo* case, and considerably complicated by the fact that the sailors of the *Pueblo* were imprisoned by a state with which the United States was not at war. They were thus formally unprotected by the Geneva Conventions and entirely without any sense of when or whether they might be returned to the United States. Perhaps for this reason, but also because of increased American sensitivity to the plight of prisoners, their "confessions" were not thought by the Secretary of the Navy to warrant court martial proceedings.

men's camps, by the election of representatives.[21] The political organization of the prison camp, whatever form it takes, considerably simplifies the moral life of the prisoners. It makes possible, for example, the rationing of available food, clothing and medical supplies. It also permits communal decisions on whether or not to support escape attempts, when these involve, as they often do, predictable reprisals against the whole society.[22]

Even when the society of prisoners cannot be politically organized, obligatory ties are likely to develop between a particular prisoner and each or any of his fellows. Shared suffering is a powerful bond among men and seems to entail—though I cannot specify the method of the entailment—very strong positive obligations to mutual assistance. These bonds seem to arise among groups of men assembled with or without regard to their previous citizenship, though they may be stronger or given practical effect more quickly among prisoners with common political and social commitments.[23] There may be some sense, that is, in which the new society is parasitic on the old. Nevertheless, these new obligations are owed to other prisoners and not to the state from which they come. When the US *Code of Conduct* requires captured soldiers to "keep faith with their fellow prisoners" (Article IV), it does little more than point to the specific context within which obligations have to be negotiated. It does not strengthen the ties, nor determine their precise character. And insofar as the obligations of prisoners to each other are enforced, later on, in state or army courts, this must be by virtue of a kind of proxy from the (now dissolved) society of prisoners.[24] Such enforcement can be justified, at least in part, by the need to prevent acts of private revenge, but not by the unqualified assertion that the state's writ runs in limbo.

IV. THE OBLIGATION TO TRY TO ESCAPE

We do admire prisoners who actively resist their captors, and such men were thought admirable even before the ideological struggles of the present day provided new motives for continuing the fight after the battle. There is a large literature, dating chiefly from the two World Wars, which documents and celebrates the efforts of prisoners of war to escape and harass the enemy. And this literature suggests that such efforts have been felt as obligations, at least by a minority of the prisoners. Moreover, the detaining powers expect (some) prisoners to try to escape; their military authorities often regard the attempt as honorable and clearly accept the necessity of establishing a secure quarantine. Thus General Clark's statement of the "old-fashioned" view: that prisoners must be maintained "and guarded." The same sense has worked itself into international law, as I have already indicated. But it is worth stressing again that the security of the right to try to escape (which is implied by the rule against punishing escapees and obviously does not include a right to succeed in the attempt) is dependent on the relative infrequency of its exercise. If attempts to escape are common, if whole camps are organized for the sole purpose of facilitating escape, as were many British officers' camps during the two World Wars,[25] then benevolent quarantine will almost certainly break down. Its cost to the captors will simply be too high, and they can argue that they had reckoned on a much lower cost when they accepted the surrender of the men in question. Thus the attempts of states like our own to require soldiers to "make every effort to escape" (Article III of the *Code of Conduct*) might well be disastrous for the soldiers, if they took the requirement more seriously than in fact they do. When we admire the men who

[21] Geneva Convention I, Article 79. Resistance groups within the camp can also be organized democratically; thus an American group in Korea, one of whose members is quoted in Biderman, *March to Calumny*, p. 171: "We . . . agreed there would be no such thing as a leader. Before we would do anything, it would go before a vote and the majority would rule."

[22] These decisions can be informally made, as in the camp described by A. J. Evans in his memoir of World War I, *The Escaping Club* (London, 1922), pp. 180–181: "Escaping came before everything, and was an excuse for any discomforts which one or two members might bring on the rest of the community. If you wished for help, almost any man in the fort would have helped you blindly, regardless of consequences."

[23] P. R. Reid discusses some of the problems that arose in the multi-national camp that the Germans ran for confirmed escapers at Colditz in World War II, in *Escape from Colditz* (New York, 1956).

[24] Sometimes prisoners set up their own courts in the camp, but these are not encouraged by the authorities on either side. See Pugh, "The Code of Conduct," pp. 683n. and 702.

[25] ". . . nearly everyone was working in some way on the X (escape) organization," Paul Brickhill, *The Great Escape* (New York 1967) p. 42; ". . . we pooled our knowledge. The camp was nothing less than an escaping club," Evans, *op. cit.*, p. 68. (The best books on escape are almost invariably written by British officers.)

"make every effort," we are really admiring heroes. It seems best to say of them, whatever they say of themselves, that their efforts are above and beyond the call of duty.

Escape is heroic only in part because of the physical risks involved, though these can be considerable, as a famous incident from World War II makes clear. In 1944, some 80 British officers escaped through a tunnel from the German camp at Sagan. All but three were eventually recaptured, and 50 were shot, apparently on direct orders from Hitler. Under the international laws of war, these executions constituted murder, and after the war the men who carried them out were tried and, some of them, executed in their turn.[26] That surely was justice done, yet it is hard to imagine a detaining power that would not go to considerable lengths to deter such mass escapes—for they tie down large numbers of troops, demoralize the civilian population, and, if successful, supply valuable information to the enemy. Hopefully, prisoners will not again have to anticipate Nazi brutality. But something less than that (and how much less can never be known) must be regarded as a normal risk. There is more involved, however, in the heroism of escape. Once a prisoner gets out of the camp, he is likely to have to spend weeks behind enemy lines, hiding or in disguise, constantly in danger, expecting discovery and arrest at every moment, able to trust no one, often without adequate food and shelter. For many men the strain must be unbearable, worse than anything that happens in battle. No prisoner can be obligated to undergo such an exacting test of his nerves and his endurance. Escape is precisely the sort of action that a man must choose for himself.

But perhaps this is not always true. In one of the best of the many books on escape, Aidan Crawley, an RAF officer captured during World War II, later a Labor MP and Undersecretary of State for Air, argues "that should a prisoner see a reasonable chance of escape, it [is] his duty to take it. Suppose a prisoner had been abandoned by his guard and deliberately sought captivity again, he would have been the equivalent of a deserter."[27] Perhaps so, but in this example, it should be noted, captivity is ended without any effort by the prisoner himself. Whether he then resumes his former military role is hard to say. It is certainly possible, but if we imagine such a man seeking refuge in the home of a friendly farmer and remaining there for the rest of the war, I doubt that we would have to say, or want to say, that he had deserted. Crawley attempts to argue that there was a duty to attempt escape even when a prisoner was securely held in a camp, but he fails to argue this with much conviction. And in fact, despite the military ethic, the sense of an obligation to escape does not seem to have been widely or deeply felt, though it is almost always acknowledged in the memoir literature. "I am sure," writes one of the bravest of British escapers, "that the majority of the men who sought to escape did it for self-preservation. Instinctively, unconsciously, they felt that resignation [to an indefinite imprisonment] meant not physical, but mental death. . . ."[28] But what of the men who did not feel this way, who decided that they could make a worthwhile life even in the prison camp?

Crawley provides one of the most sympathetic accounts of these men, and he is worth quoting at length:

> From the first moment of captivity . . . there began in every prisoner's mind a conflict which lasted often until the day of liberation. Should he, or should he not try to escape? Ought he to spend his time in what would almost certainly be fruitless endeavor, or should he use it to equip himself to be a better citizen later on? There were many who from the start decided on the course of self-improvement. With great force they argued that, however heroic escape might appear, the odds against success [were] so enormous that the realistic and truly patriotic thing to do was to put the idea out of their minds. . . . To every thinking man, the wisdom of spending years in hopeless effort must at some time have seemed questionable and no one could blame those who decided escape was not worthwhile. Provided they stuck to their guns and held their point of view with tolerance, they were often most valuable members of the community.[29]

To call such refusals "patriotic" is to put a good construction on them, but not necessarily the only good, or the best, construction. Refusal to escape might also express a man's sense of belonging, now, "to humanity and to himself," or his sense of personal obligations to family and friends. It might express his solidarity with his fellow prisoners, or with some of them doomed to remain in the camp for the duration of the war and in need, perhaps, of his help building a decent community.[30] And it might express his

[26] Brickhill, *op. cit.*, pp. 211–223.

[27] *Escape from Germany* (New York, 1956), p. 8.

[28] Reid, *op. cit.*, p. 35.

[29] *Op. cit.*, p. 7.

[30] Exactly what this means and how such a community can be built are the main concerns of J. Davidson Ketchum's fine sociological study, *Ruh-*

human fear or his relief at finding himself relatively safe and far from the battlefield. Surely if a man makes himself "a valuable member of the (prison) community," even these latter reasons need not be judged any more harshly than the others.

Curiously enough, one of the best arguments on behalf of escape, even mass escape, is that the attempt is itself of value to the society of prisoners. Crawley has once again put the argument very well:

> Most important of all, the effort to escape preserved the morale of the prisoners themselves. One of the great difficulties of prison life was that almost all effort, apart from the business of feeding and existing, was directed to goals which could be achieved only in the indefinite future. The mere fact that in preparing for a mass escape hundreds of people were co-operating in an enterprise which held the prospect of an immediate result was the best tonic a prison camp could have. In building a tunnel, making clothes, forging papers, or preparing maps, men took part in a common effort and once again got the feeling of serving a community.[31]

It may be that this new community is parasitic upon the old: that escape can be a common enterprise of the prisoners only because it is an enterprise of value to the state and army from which they commonly come. But this is not necessarily so. In Pierre Boule's novel (and in the better film by David Lean), *The Bridge Over the River Kwai,* the common enterprise of the prisoners is not of value to their state.[32] On the contrary, it poses a serious threat and even requires a military response. Yet it has an effect, and a plausible effect within the novel and the film, identical to that which Crawley describes. In the River Kwai case, the obligations that may arise to work on the bridge, and to work strenuously, are owed to one's fellow prisoners and to no one and nothing else. There is a certain absurdity in the spectacle of hundreds of men working with such zeal on a bridge that they "really" (as members of the conventional world, citizens and soldiers) don't want built. But this is an absurdity always possible in limbo, and it is the achievement of the novel and film to have evoked it. Nor is it clear that enterprises of more conventional value are very much less absurd. The extraordinary discipline and skill, the zeal and the sheer genius, that went into the British escape from Sagan were surely out of all proportion to its salutary effects upon the British war effort. George Harsh nicely summed up "the great escape" when he wrote of the prisoners involved that "they proved for all posterity that men, working together, can dig a damned deep hole in the ground. . . ."[33] Yes, they did prove that, and that hole was their triumph over captivity, their human triumph, as was the bridge for another group of men; and they dug it first of all for each other.

V. CONCLUSION

In limbo obligations are, by and large, not given, not established by any sovereign state, not waiting for discovery; they must be improvised. Attempts to specify them that go beyond those negative obligations which all citizens share are likely to be impositions on the freedom of the men involved and sometimes a cruel threat to their security. That is why they are largely ignored by the prisoners. Citizens and soldiers, safe or relatively safe among their comrades, have every right to hope that prisoners will form some sort of society, find an effective way of making collective decisions, and remain faithful to one another. Armies have every right to train their soldiers to behave in that way. But to insist that this is what prisoners ought to do is to say nothing more than that they owe this much to one another, and finally it is up to the prisoners to say that themselves. Citizens and soldiers, and presidents and generals, may also hope that some of the prisoners will be heroes, that they will discover uncommon resources of courage and endurance, and unilaterally re-establish obligations that in fact have lapsed. But such heroism, it must be recognized, is also a denial of captivity, perhaps even a refusal of benevolent quarantine, and so a potential threat to the status of all those prisoners who don't choose to be heroes. All the more reason, then, that heroism should not be demanded by those of us who cannot expect to feel its consequences.

The fight does not continue after the battle, not for the men who have been captured, unless they choose together to fight on and accept the risks that choice involves. They have every

right to choose differently, and this is what most of them do, opting for benevolent quarantine whenever it is offered. It is the responsibility of civilized men to insist that it always be offered and to repudiate decisively and without compromise the very idea of a "total war" to be fought within as without the bounds of the prison camp. The requirements of humanity are clear enough: detaining authorities must assume, and the prisoners' home states must give them reason to assume, that prisoners are not combatants and are no longer required by their citizenship to fight. Then they may safely be treated, and then they ought to be treated, if not like "citizens of the world," at least like men entitled to rest for a while in limbo.

THE GROWTH OF THE SENIORITY SYSTEM IN THE U. S. HOUSE OF REPRESENTATIVES*

I. THE SIGNIFICANCE OF SENIORITY

Popular discussions of the internal management of the U.S. House of Representatives in the present era generally give great weight to the ubiquity and arbitrariness of the seniority system as a significant determinant of outcomes there. Careful attention to the scholarly literature, however, should long since have modified this view. For it appears that except for relatively unimportant matters such as the allocation of office space on Capitol Hill,[1] the criterion of seniority is generally intermingled in House decision-making with a great many other crite-

* The study of which this article is a part was made possible by the generosity of the Rockefeller Foundation, the Institute of International Studies, and the Institute of Governmental Studies of the University of California, the Social Science Research Council, Wesleyan University, the Center for Advanced Study in the Behavioral Sciences, and the Carnegie Corporation of New York, the latter through its grant to the American Political Science Association for the Study of Congress. After this article was largely drafted, we were able to read "The Rise of the Modern Seniority System in the U.S. House of Representatives," an unpublished Harvard A.B. honors thesis (April 1966) by Michael Eckstein Abram. Though based on a more restricted sample of data than the present report, the main lines of Mr. Abram's findings are gratifyingly similar to our own. They are reported also in Michael Abram and Joseph Cooper, "The Rise of Seniority in the House of Representatives," *Polity* I (Fall 1968), 52–85. We are grateful for the creative assistance of Paul Sniderman, Robert von Eigen, Joan McLaughlin, and Sam Kernell. An earlier draft of this paper was read at the Annual Meeting of the American Political Science Association, Washington, D.C., September, 1968.

[1] The Speaker has executive responsibility for the House side of the Capitol, including the three House Office Buildings, which he exercises through his chairmanship of the House Office Building Commission. The rules currently in effect on the allocation of office space are: Each member is entitled to the space he currently occupies. Vacancies as they occur are allocated to claimants in order of their seniority. Entering freshman members are ordered by lot and given their choice of the remaining office space at a predetermined time at the beginning of each Congress. Any extra office space over and above members' suites and rooms set aside for the offices of specific committees are allocated at the discretion of the Speaker. See Donald G. Tacheron and Morris K. Udall, *The Job of the Congressman* (Indianapolis: Bobbs-Merrill, 1966), pp. 41–43, 277–279.

Until the opening of the Rayburn Building, the third House Office Building, in 1965, no clear patterns of preference for office space were discernible. Some members liked to be near the Capitol; others preferred more remote locations, away from the crowds of tourists. Many members had their offices near the rooms of the committees to which they were assigned, which were spotted through both "old" buildings. Some members preferred the more modern facilities of the Longworth Building (opened, 1926). Others agreed with Clem Miller: "I don't care for it. Low ceilings, panelled walls smacking of a 1925 corporation lawyer. . . . I am in the Old Office Building [built 1909], a huge square with a hollow center, wide corridors, high ceilings. Old-fashioned railroad car carpeting. High-backed leather chairs. If you take away the electric typewriters, you move right into the world of William Howard Taft." *Member of the House* (John W. Baker, ed.), (New York: Scribner's, 1962), p. 27.

The Rayburn Building has changed some of this: about half of the House, including most of the senior men, are in it. Rayburn Building offices are larger and more commodious; the much greater inconvenience in getting from the Rayburn Building to the Capitol is somewhat offset by the installation of a Toonerville trolley in the subway that runs between this building and the Capitol building. The two older office buildings are being remodeled to provide more or less equal space for everyone once again.

ria of choice, and the business of choosing is not automatic, but remains in the hands of persons having some considerable discretion. This, apparently, is the case with respect to such decisions as the allocation of Capitol Hill patronage,[2] the initial assignment of Representatives to committees,[3] the distribution of responsibilities within committees,[4] and the choice of party leaders.[5] The one important area in which seniority is generally followed is the choice of committee chairmen.

[2] There are a number of kinds of Capitol Hill patronage. Employees of the Capitol fall under the control of the majority party. Major employees at the level of Clerk of the House, Sergeant at Arms, Parliamentarian, Doorkeeper and Postmaster are formally selected by party caucus, in fact are usually appointed by the Speaker, and are elected by vote of the whole House. These are more or less permanent career jobs, and most have minority counterparts built into the organization. When party control of the House shifts, the permanent top bureaucrats of the House exchange jobs with their minority "shadows." When a vacancy occurs, the Speaker appoints what amounts to a permanent member of the Congressional bureaucracy. Jobs at the middle level such as assistant doorkeepers, assistant parliamentarians, folding room superintendent, reading clerks, recorders of debate, and so on are also regarded as career jobs, and require the initial sponsorship of Congressmen of the majority party. These jobs also come under the purview of the Speaker. Low level jobs such as elevator operator, mail room employee, page, are also handled by a system of sponsorship and cleared through a committee of the majority party appointed by the Speaker. An informal quota system based in part upon the seniority of members determines the entitlement of members to sponsor candidates for these jobs.

A second form of patronage is provided by the Congressional campaign committees of each party which allocate funds to House incumbents running for reelection. Seniority as such plays little part in the distribution of these funds. See Michael J. Kirwan as told to Jack Redding, *How To Succeed in Politics* (New York: MacFadden, 1964), pp. 9–11; and Hugh A. Bone, *Party Committees and National Politics* (Seattle: Univ. of Washington, 1958), pp. 120–165, esp. p. 147.

[3] See Nicholas A. Masters, "Committee Assignments in the House of Representatives," this REVIEW, 55 (June, 1961), 345–357. Masters gives the following desiderata for appointments to committees: the candidate must show "legislative responsibility," i.e., personal characteristics of flexibility and willingness to follow norms of predictability, reciprocity and courtesy; his district should allow him flexibility in major matters—which means that norms internal to the House must be allowed to weigh heavily in his committee decision making; the geographical balance of committees must be preserved; and the appointment should bear some relationship to the member's chance of being reelected. In addition to these criteria, Masters says: "When two or more members stake a claim to the same assignment, on the ground that it is essential to their electoral success, both party committees usually, if not invariably, will give preference to the member with longer service." State delegations sometimes but not always use seniority as the criterion determining which among their members will lay claim to a seat on a major committee that the state is thought to be "entitled" to. On the whole, large state delegations are much more successful than small states in getting the committee assignments they want for their members. This is true for both parties, and it operates without regard to the seniority of individual members.

[4] Seniority is generally followed pro forma in the granting of subcommittee chairmanships, but not always. Neither Adam Clayton Powell nor Phil M. Landrum received subcommittee assignments, much less chairmanships, when they were each ranking member of the Education and Labor Committee. This was an unusually frank recognition of estrangement between them and their respective committee chairmen. Ordinarily, senior men out of favor with the chairman receive the recognition of a subcommittee chairmanship, but since the membership and the substantive responsibilities of subcommittees are more or less discretionary with the chairman, it is quite easy for the committee chairman to circumvent a subcommittee chairman he dislikes or mistrusts. Thus the operation of seniority in the organization of subcommittees does not necessarily mean very much. See e.g. Richard F. Fenno, "The House of Representatives and Federal Aid to Education," in Robert L. Peabody and Nelson W. Polsby (eds.), *New Perspectives on the House of Representatives* (Chicago: Rand McNally, 1963), pp. 195–235.

[5] Seniority in a strict sense does not enter in as a criterion for party leadership. To be eligible for consideration as a party leader, a member must have served long enough to be well known; but Carl Albert was tied with nine others for 30th in seniority on the Democratic side of the aisle when he was elected majority leader in a 1962 Democratic caucus. The Republican caucus has twice, in recent years, removed a senior man from the party leadership and replaced him with a more junior one. Factors of personality, sectionalism and ideology seem to matter most in the choice of party leaders—including chairmen of the caucuses, whips, assistant whips, and Congressional campaign committee chairmen. See Nelson W. Polsby, "Two Strategies of Influence in the U.S.

niority seems to play a role of overwhelming significance is in the matter of succession to the chairmanship of committees; this is in turn governed by the custom (not a formal rule) of seniority that guarantees members reappointment to committees at the opening of each new Congress, in rank order of committee service. It is the growth of this method of selecting committee chairmen in the House that is the subject of this paper.

The importance of a committee chairmanship varies, to be sure, with the importance from session to session of the legislation considered by the committee. It is also significantly modified by committee customs and practices, since formally, committee chairmen are subject to the will of committee majorities. Committees vary in the discretion they leave to their chairmen, and many examples exist of committee chairmen who were bypassed or defeated in specific controversies when they had gone "too far"—or not far enough.[6] Nevertheless, it would be foolish to deny that committee chairmen, on the whole, have enormous power over the activities of their committees, and over the ultimate output of Congress. It is generally the chairman who sets the pace that determines the total workload of the committee, the chairman who hires and fires staff, the chairman who forms subcommittees and assigns them jurisdictions, members and aides. It is generally the chairman who manages the most important bills that are assigned to his committee, and at his own option oversees the endless tinkering with the substance of major bills that goes on in committee, on the floor, and in conference. All this is common knowledge; it provides a backdrop for the continuing interest of scholars and men of affairs in the people who become committee chairmen, and in the process that selects them.

Parliamentary bodies differ in the extent to which they divide labor and decentralize power. The two are, moreover, not precisely synonymous, since an efficient division of labor can be achieved while retaining centralized control. Such is the case, for example, in the Italian Parliament and the Japanese Diet, where strong committee systems are combined with strict party government.[7] Decentralization of power without division of labor leads to parliamentary ineffectiveness, as in Colombia and Ecuador.[8]

A more familiar pattern than either, one congenial to the classic British parliamentary features of ministerial responsibility and strict party regularity, is the centralization of power in the hands of party leaders and a division of labor in the legislature that is rudimentary at the very most. Thus Bagehot's magisterial classification of the 19th century House of Commons as an "electoral chamber" that passes upon the legitimacy of the sitting government but engages not at all in policy-making.[9] At the opposite extreme is a legislature where labor is divided and where power is likewise decentralized, such as in the case of the contemporary U.S. House of Representatives.

Operational indices of these characteristics

House of Representatives: Choosing a Majority Leader, 1962," in Peabody and Polsby, *op. cit.*, pp. 237–270; Robert L. Peabody, "The Ford-Halleck Minority Leadership Contest, 1965" *Eagleton Institute Case in Practical Politics,* No. 40 (New York: McGraw-Hill, 1966); and Peabody "Party Leadership Change in the United States House of Representatives" this REVIEW, 61 (September, 1967), 675–693.

[6] Examples would include the following: There was a revolt against Chairman Dan Reed, of the Committee on Ways and Means in 1953. See Raymond A. Bauer, Ithiel de Sola Pool and Lewis Anthony Dexter, *American Business and Public Policy* (New York: Atherton, 1963), p. 33; a revolt against Chairman Clair Hoffman of Government Operations in the same year; a number of small-scale rebellions against two successive chairmen of the Committee on Education and Labor (see Fenno, *op. cit.*); two major rebellions against Judge Smith of the Rules Committee, one in 1961 that packed the Committee against him, and one in 1965 that established the 21-day rule; in 1965–66 and again in 1967 a revolt against Chairman Wright Patman of the Banking and Currency Committee; and in 1967 a revolt against Chairman William Colmer of the Rules Committee. Both these latter revolts eventuated in important changes in committee rules.

		DIVISION OF LABOR	
		Strong (Strong committees)	*Weak* (Weak committees)
POWER OVER POLICY	*Centralized* (Strong party leadership)	Italian Parliament Japanese Diet	British House of Commons
	Decentralized (Weak party leadership)	U. S. House of Representatives	Columbian and Ecuadorian Legislatures

FIGURE 1. Relationships Between the Division of Labor and the Centralization of Power over Substantive Policy in Legislatures.

can be suggested, and in so doing, the importance of seniority can be clarified. Briefly, the strength of a division of labor can be defined as the extent to which legislatures rely upon standing committees to conduct their business. When committees are not relied upon, centralization of power can be observed in the extent to which the initiation and modification of policies eventually enacted by the legislature is concentrated in a few hands (normally the hands of party leaders) or dispersed into many. When committees are relied upon, whether they are populated by automatic or discretionary means, and whether discretionary means are at the discretion of few or many members, is an acceptable test of the centralization or decentralization of power.

From these stipulations, we can deduce that an automatic means of assigning members to committees is a sufficient, though not a necessary, condition for decentralization of power, to the extent that committees are heavily relied on in legislatures. A seniority system is automatic. Therefore, in the U.S. House of Representatives, where committees are strong, the seniority system is sufficient to explain the decentralization of congressional power.

The extent of a seniority rule's application may be said to constitute a measure of the allocation of discretion and hence of power as between party leaders and committee chairmen. Previous commentators have agreed upon this even when they agreed on little else.[10] It is of course not the only such measure imaginable, but it is an important one. Committee chairmen subject to the selection of party leaders stand in a different relation to the leadership than chairmen selected by an impersonal process in which the leadership is powerless to interfere. Thus, like pregnancy, seniority is for most purposes a dichotomous variable. When seniority operates as a partial influence upon decision-making rather than as an automatic determinant of committee rank, political influence flows to those empowered to vary the application of the diverse criteria of choice—normally party leaders. When seniority is sovereign and inviolate, power is decentralized to those accordingly protected.

II. WHEN DID SENIORITY BEGIN?

There is disagreement in the literature about how well-entrenched decision making by seniority has been in the House, and for how long. Numerous anecdotes exist, testifying to the violation of seniority in the selection of committee chairmen in former times.[11] Nowadays, the year 1910, which marks the revolt against Speaker

[10] See, for example, on one hand, James K. Pollock, Jr., "Seniority Rule in Congress," *The North American Review*, 222 (1925), 235–245; and on the other, the testimony of George H. E. Smith in the Hearings, Senate Committee on Expenditures in the Executive Departments, *Evaluation of Legislative Reorganization Act of 1946* (80th Congress, 2nd Session) Washington: Government Printing Office, 1948), pp. 61, 71–73, 184–185. These are collected in Walter Kravitz, "Seniority in Congress" (mimeo.), Library of Congress Legislative Reference Service, November 7, 1961.

[11] See, for example, Chang-wei Chiu, *The Speaker of the House of Representatives Since 1896* (New York: Columbia Univ. Press, 1928), pp. 64–68; George B. Galloway, *History of the U.S. House of Representatives* (House Document 246, 87th Congress, 1st Session) Washington: Government Printing Office, 1962), 62–63; Pollock, *op. cit.*

Cannon, is often mentioned as the effective beginning of the system. George Galloway says: "Seniority in point of service has been the prevailing principle governing both committee assignments and the selection of chairmen since ... 1910 in the House."[12] However, James K. Pollock maintains, "From early years the rule that has been generally followed in the appointment of committees is the so-called seniority rule. It has made no difference whether Republicans or Democrats controlled Congress; the method of selection has been the same.... The practice ... is a universal one. . . ."[13] Chang-wei Chiu shows that in the four Congresses just prior to 1910 (the 58th to 61st), with respect to ten important committees, many appointments were made at the discretion of the Speaker, but "more than four-fifths of the members . . . were appointed under the seniority rule."[14] Writing in 1884, Woodrow Wilson says: "The Speaker is expected to constitute the committees in accordance with his own political views . . . [and he] generally uses his powers as freely and imperatively as he is expected to use them." But he also writes: ". . . by custom, seniority in Congressional service determines the bestowal of the principal chairmanships."[15]

These writers seem to be reporting upon a situation in which seniority figured as a criterion of choice, but where discretion was left to party leaders. Hence they are describing a period preceding the advent of a seniority *system* such as operates today. Earlier, in 1865, there seems to be no doubt or ambiguity about the locus of power to allocate committee chairmanships. W. R. Brock writes, "The Speaker was a man of considerable influence and much depended upon him. He appointed members of committees, acted in effect as majority leader in the arrangement of business, recognized or failed to recognize would-be participants in debate, interpreted the rules of the House, and dealt with the numerous points of order. . . . A good deal of power rested with the chairmen of committees, though perhaps less than in more recent times. . . ."[16] Likewise, in 1871, the Speaker constituted the committees. A member of Speaker Blaine's household wrote in a family letter, "Your father sits here at the table toiling away over his committees. . . . As fast as he gets them arranged, just so fast some after-consideration comes up which disarranges not one, but many, and over topples the whole row of bricks. It is a matter in which no one can help him . . . [He] had wool and cotton manufacturers to meet in Boston, dinners, breakfasts, and lunches . . . to give and take in New York, and, over and above all, pressures, to resist or permit, of Congressional committees."[17]

There is much other commentary on the wide discretion of the Speaker before 1910. George Rothwell Brown observed, "The right of the Chair to delay making committee assignments for long periods was recognized, Mr. Reed, for example, refraining from appointing the committees in the 55th Congress for 131 days."[18] James Bryce, in the revised edition of *The American Commonwealth* (1905) says: "In America the Speaker has immense political power, and is permitted, nay expected, to use it in the interests of his party . . . His most important privilege is . . . the nomination of the numerous standing committees. . . ."[19] Alexander, writing just after the 1910 revolt against Cannon, says, "The Speaker's greatest power has its source in his authority to appoint committees."[20]

There is, obviously, an important empirical question to be settled which these quotations, taken all together, raise. This has to do with the extent to which seniority was actually followed in the assignment of committee chairmanships before a hard and fast seniority system was established. The answer to this may, in turn, raise questions about the processes by which seniority came to be established as an inflexible norm in the House of Representatives.

The data we shall presently consider consist of a report on the selection of all chairmen of House standing committees, by Congresses, from the 47th to the 88th Congress (1881–1965). This information was gathered from *The Congressional Directory* for each Congress. From the 75th to the 88th Congress, committee

memberships are listed and the party affiliations of members designated in the *Directory*. Prior to the 75th Congress, the *Directory* lists committee members without designation as to party. However, from the 74th back through the 55th Congress, the committee lists were, with a few discrepancies, columnized by party affiliation. After an unsystematic but reasonably thorough cross-check in the *Biographical Directory of the American Congress*,[21] these columnizations were followed. From the 54th to the 47th Congress, a systematic and complete checking of names in the *Biographical Directory* enabled us to establish party designations.

The Congressional Directory was published for each Congress we studied; but its publication schedule has been erratic. The most common practice seems to have been for the *Directory* to appear once for each session of every Congress, that is, annually. However, in some years, the first edition of the *Directory* appeared before committee lists were established. Since we proposed to sample committee lists only once per Congress, we adopted the policy of consulting the first edition of the *Directory* available to us for each Congress that contained full listings of committee members. Thus changes in chairmanships within Congresses may have been lost to us.[22]

The *Directory* is neither a wholly uniform, nor a strictly official source; much superior would be the committee lists appearing in the *Journals* or the assignments as they are recorded in the verbatim accounts of debates, currently entitled *The Congressional Record*. However, the former of these sources is not widely available, and the latter is not indexed under the rubric "Committee Assignments." Hence both are exceedingly cumbersome for the purposes of research and, in any event, would in all probability disclose only the most insignificant variations from the *Directory*.

Our most important finding can be summarized in a single table which shows for each Congress the number of times that seniority was and was not followed in the appointment of committee chairmen for each of 40 Congresses from 1881 to 1963. When a committee chairman met the following conditions he was classified as a chairman by virtue of seniority: In the preceding Congress he was the chairman, or if his party was in the minority, the ranking member, or he had been on the committee in the previous Congress and all those listed above him for that Congress were no longer serving in

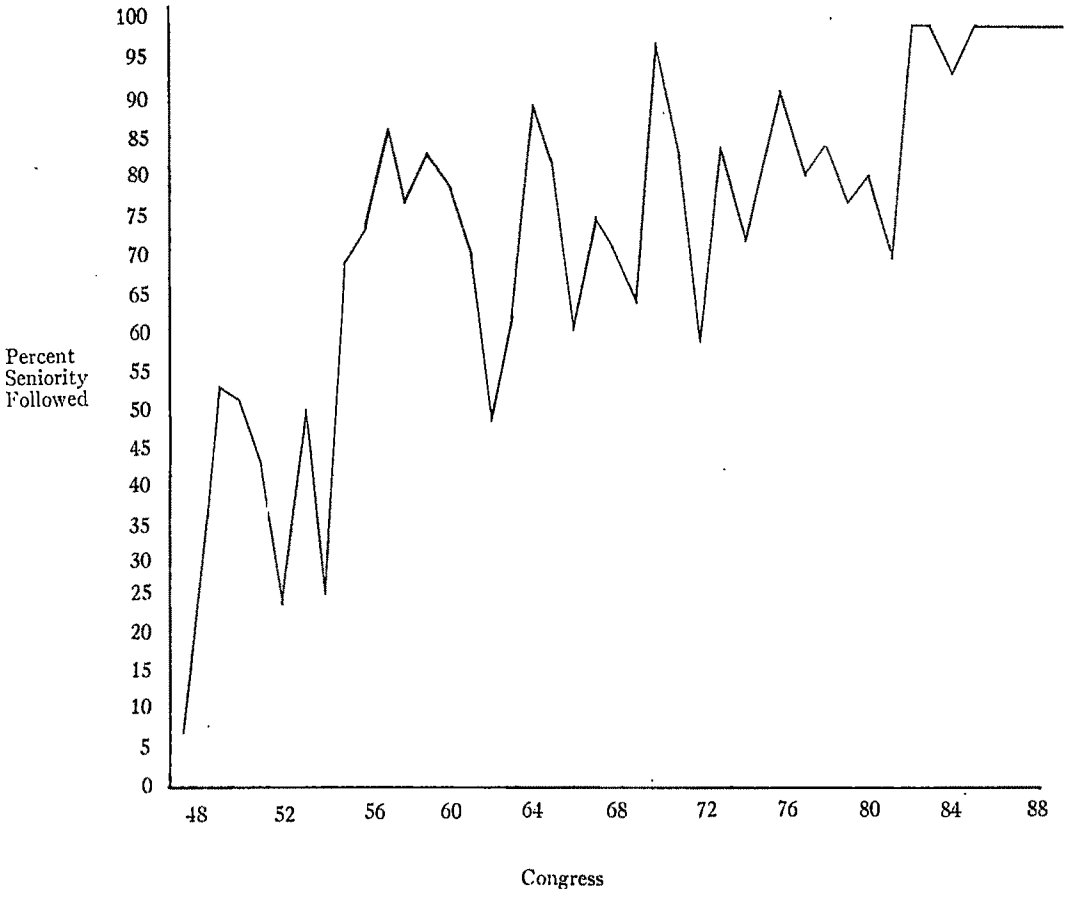
* Total equals the number of committees in the Congress minus the number of new committees and the number of committees in which the three top members in the previous Congress are absent in the present Congress. The latter are excluded because we have no data on men below the number three position in the previous Congress.

[21] *Biographical Directory of the American Congress*, 1774–1961 (Washington, Government Printing Office, 1961).



[22] We doubt that this would make much difference in our findings. Paul DeWitt Hasbrouck says, "Even Speaker Cannon did not go so far as to remove a committeeman in the middle of a Congress." *Party Government in the House of Representatives* (New York: Macmillan, 1927), p. 50.

Congress. If a chairman could meet none of these conditions, he was classified as having been designated by some method other than seniority. These simple rules of classification yielded Table 1.

The general trend, over the 80-year period, is toward the increasing use of seniority as a determinant of committee chairmanships, as Figure 2 shows.

FIGURE 2. The Growth of Seniority: 1881-1963

Percentage of Committees on which Seniority was followed in the Selection of Chairman, by Congress*

* Percentages were calculated as follows: Seniority (from Table 1) divided by Total Committees (from Table 1) for each Congress.

Several different kinds of seniority violation are summarized in Table 1. Some members of Congress who by our criteria should have been committee chairmen were demoted. Others stayed at the same rank but were jumped by members from below them on the list or from elsewhere. Others left their committees. Some of these received new committee assignments, others did not. Of those who received new assignments, some did as well as or better than if they had stayed put.[23]

[23] In classifying committees by order of importance (and therefore desirability) we relied upon two sources; Chang-wei Chiu's listing of important committees (*op. cit.* pp. 68–69) for the early period, and the sorting of committees into three classes by the Amended Legislative Reorganization Act of 1946, which provided that 1) Three committees are *exclusive*—namely Appropriations, Rules, and Ways and Means. A member who serves on any of these can serve on no other committee. 2) Ten committees are *semi-exclusive:* members may serve on any one of them and any one of the seven non-exclusive committees. The ten are: Agriculture, Armed Services, Banking and Currency, Education and Labor, Foreign Affairs,

Finally, some members who otherwise might have become, or remained, chairmen were found to hold chairmanships of other committees, or party leadership positions. Thus Table II distinguishes instances where potential chairmen whose seniority was violated seem to have been compensated in the appointment process from instances where no such compensation is visible.

Compensation was not fully in the discretion of House leaders. A senior member who picked between chairmanships was not necessarily in the debt of the Speaker. Appointments to new positions as good as or better than a relinquished chairmanship were undoubtedly negotiated through the party leadership of the majority party (and, after Speaker Cannon established the custom, for minority members in negotiation with the leaders of the minority party) but it is difficult to interpret compensations as entirely within the Speaker's control, since it was necessary for the Speaker to use the appointment power to build a coalition that would support him in office by rewarding his allies and mollifying the leaders of rival factions within his party.[24]

Uncompensated violations of seniority can be interpreted as purer examples of central leadership, since they represent instances where the committee assignment process was used by party leaders to intervene in the careers of members but where no payment in kind can be detected. As Figure 3 makes clear, this sort of intervention declined rapidly over the years surveyed, barely surviving after the 1911 rules changes vesting the Speaker's jurisdiction over committee assignments in party committees on committees.

Compensated violations of seniority, however,

TABLE 2. COMPENSATED AND UNCOMPENSATED VIOLATIONS OF SENIORITY*

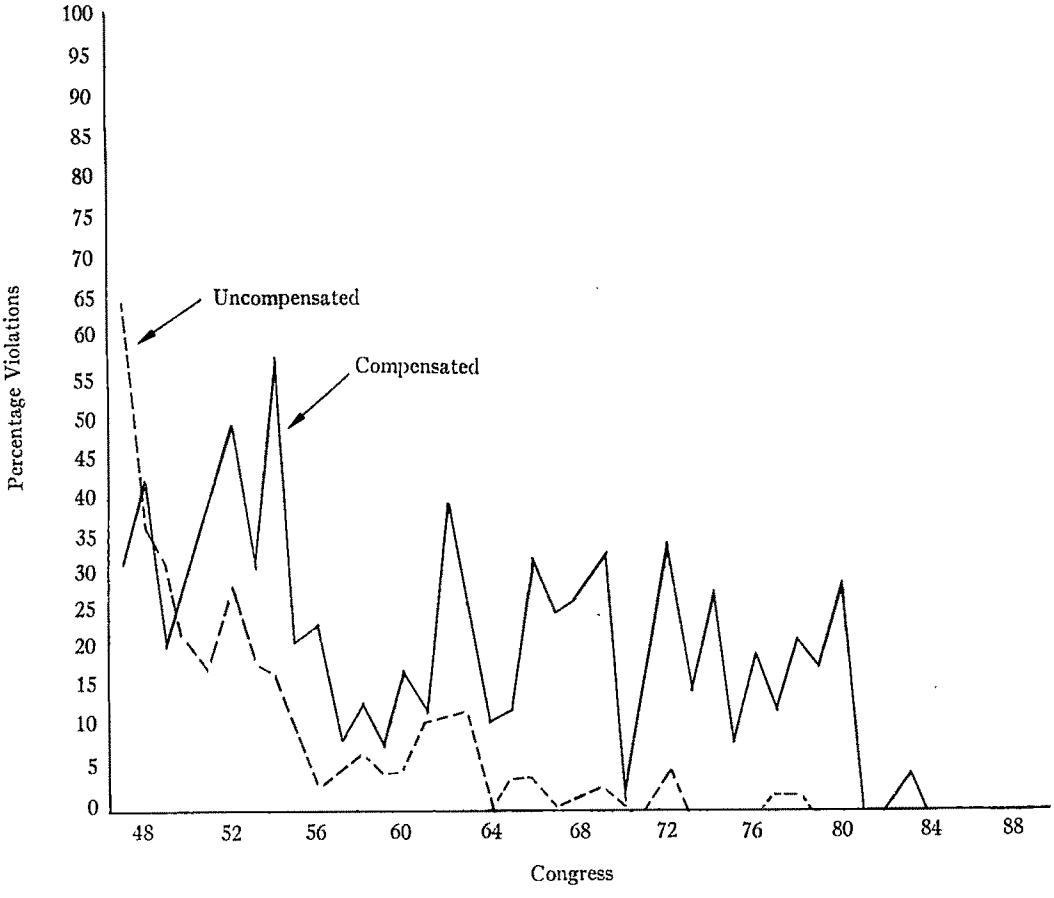
* Uncompensated violations of seniority occur when members eligible to be chairman are not and meet one or more of the following conditions: Demoted, Jumped, Received no new assignment, or Held a chairmanship on a less desirable committee.

Compensated violations occur when potential chairmen receive or hold better assignments, or equal or better chairmanships or are elected to party leadership.



For rankings of committees, see footnote 23.

Interstate and Foreign Commerce, Judiciary, Post Office and Civil Service, Public Works, and Science and Astronautics. 3) Seven committees are *non-exclusive*. A member may serve on any two of these seven, or on any one plus one of the ten-semi-exclusive committees. The seven are: District of Columbia, Government Operations, House Administration, Interior and Insular Affairs, Merchant Marine and Fisheries, Un-American Activities, and Veteran Affairs. Chiu mentions four committees not listed above as having some importance in the period (1896–1928) covered by his study. These are committees on Military Affairs, Naval Affairs, Post Offices and Post Roads and Rivers and Harbors. For our purposes, we considered these four semi-exclusive committees.

A total of 57 standing committees other than the ones mentioned in our sources also existed at some point in the period covered by our study. These were added to the non-exclusive committees for our purposes. In general, changes in the total numbers of committees over the years (until the major consolidation of 1946) reflect changes in the number of minor committees.

[24] For examples, see Abram and Cooper, *op. cit.*, pp. 63 ff.

FIGURE 3. Compensated and Uncompensated Violations of Seniority, 1881-1963

survived well into the 20th century. Table 3 demonstrates that most of these violations occurred on committees whose chairmen had become chairmen of committees of equal or greater importance. Less significant numerically are potential chairmen of insignificant committees who take up appointments instead on more important committees. Before 1911, these appointments to new committees were not necessarily at the bottom; committee rank was assigned at the Speaker's discretion—although this was not frequently used to disturb committee rank orders.

Seniority is now strictly observed in the placement of new members, which means that the costs of transferring from a chairmanship to membership on a better committee have risen over the years. Even so, a compensated violation of a chairman's seniority can be recorded for the 91st Congress. In the waning days of the 90th Congress Rep. Omar Burleson of Texas gave up his chairmanship of the moribund Committee on House Administration to fill a vacancy on the Ways and Means Committee—where he will rank below Democrats far junior to him in House service. For obvious reasons, this is not a frequent occurrence.

Almost as infrequent, indeed, is the transfer of any member from the middle or top range of any committee to the bottom of any other, no matter what the disparity in the prestige of the two committees. When such a transfer does take place, it is generally at the request either of party leaders or of the leaders of a particularly large and cohesive state delegation that can find no other or more satisfactory way of exercising its option to occupy a seat on a key committee.

Compensated violations, in short, do not reflect the concentration of political power in any reliable way, since they may occur as the outcome of bargains between party leaders and members, but more often involve a choice between chairmanships. Uncompensated violations, on the other hand, disclose more about options available to party leaders. The sharp decline in the frequency of this sort of violation during the

88	1963	0	0	0	0	0	0	0

period covered by our investigation suggests that these options were somewhat circumscribed and could hardly have been exercised whimsically or without cost. A closer look at patterns of violation before 1911, to which we now turn, may suggest ways in which party leaders managed and conserved their options in the committee assignment process.

III. HOW SPEAKERS MANAGED: PATTERNS OF VIOLATION BEFORE 1910

Until the 1910 revolt against Cannon, Speakers held the formal power to name committees from top to bottom, majority and minority. They were expected to use this power to enhance their ability to lead their party to legislative success. Their allies expected to be favored,

their rivals to be placated. The extent to which Speakers fulfilled these expectations is reflected in the pattern of uncompensated seniority violations before 1910.

The Speaker's discretion in the appointment of committee chairmen was not a free good. It had to be employed carefully. Thus, instead of tearing up committee rosters root and branch at the opening of each Congress, Speakers concentrated on a relatively few appointments on only a few committees. Pollock mentions a tabulation by Representative Luce showing "that in the seven appointings that took place from 1896 to 1910 about 407 chairmen were named. Of these 265 were reappointments, 93 were promotions of men already on the committees, and only 49, or an average of seven for each appointing, were new men brought to chairmanships from outside the ranks of the respective committees."[25] Our figures, tabulated on a slightly different base (since we were limited as indicated in the note to Table 1) and classifying as violations instances where potential chairmen were jumped from within the committee as well as cases where they were replaced from outside, are nevertheless confirmatory: for the same seven Congresses (55th through 61st) 304 out of 397 appointments (77%) involved no violations of seniority at all. Only 34 of the 397 (8.5%) were uncompensated violations. For the longer period, 1881 to 1910, 133 of the 750 appointments to chairmanships were uncompensated violations of the seniority principle.

The strategies available to Speakers in the appointment process before 1911 varied according to easily described external conditions. There was, first of all, the problem of creating a coalition, when a new Speaker took control of a new majority after an election which brought a new party to the control of all committees. Under these circumstances a new Speaker had new friends to reward and rivals to neutralize, and so it is not surprising that violations of seniority in these circumstances were higher than in years when the Speaker was new but the majority was not, or when there was no change in leadership. This is the finding expressed in Table 4.

Speakers under these circumstances were also able to replace incumbent chairmen (as contrasted with the more vulnerable men newly eligible for chairmanships) to a degree not possible when there had been no party turnover as Table 5 shows.

When Speakers replaced incumbents, they preferred to move the chairman off the committee rather than keep him on looking over his successor's shoulder; this was less necessary for nonincumbents, as Table 6 suggests.

Table 7 shows a sharp contrast between the treatment of incumbent chairmen and others in

[25] Pollock, *op. cit.*

TABLE 4. WHEN THERE IS A NEW SPEAKER AND A NEW MAJORITY SENIORITY VIOLATIONS ARE FREQUENT 1881–1910

	New Speaker, Party Turnover	New Speaker, but No Turnover	No Turnover
Seniority Followed	25% [55]	77% [83]	69% [287]
Seniority Violated	75% [168]	23% [26]	31% [127]
	100% [223]	100% [109]	100% [414]

TABLE 5. WHEN THERE IS PARTY TURNOVER, THE NEW SPEAKER CAN VIOLATE THE SENIORITY OF INCUMBENT CHAIRMEN WITHOUT COMPENSATION (1881–1910)

	New Speaker Party Turnover	New Speaker No Turnover	No Turnover
Incumbent	58% [40]	17% [1]	26% [14]
Nonincumbent	42% [29]	83% [5]	74% [40]
	100% [69]	100% [6]	100% [54]

TABLE 6. WHEN AN INCUMBENT CHAIRMAN'S SENIORITY IS VIOLATED, HE IS MOVED TO ANOTHER COMMITTEE RATHER THAN DEMOTED

	Uncompensated Violations	
	Chairmen	Nonchairmen
Demoted	20% [11]	61% [45]
Moved	80% [44]	39% [29]
	100% [55]	100% [74]

TABLE 7. IN YEARS WHERE THERE IS NO PARTY TURNOVER, THE POWER OF CHAIRMEN TO RESIST DEMOTION IS INCREASED

	Turnover Years		No Turnover Years	
	Chairman	Nonchairman	Chairman	Nonchairman
Demoted	25% [10]	39% [11]	7% [1]	53% [24]
Moved	75% [30]	61% [18]	93% [14]	47% [21]
	100% [40]	100% [29]	100% [15]	100% [45]

TABLE 8. COMPENSATED AND UNCOMPENSATED VIOLATIONS REMAIN CONSTANT, REGARDLESS OF CHANGES IN MAJORITY PARTY 1881–1910

	New Speaker Party Turnover	No Party Turnover
Violations		
Compensated	59% [99]	61% [93]
Uncompensated	41% [69]	39% [60]
	100% [168]	100% [153]

years when there is no party turnover. Party turnover, in other words, appears in our data as a strong force legitimizing activities that in more "normal" circumstances were not permitted to Speakers.

Even though new Speakers taking control of new majorities violated the seniority of chairmen and potential chairmen much more often than was true in most new Congresses, the ratio between compensated and uncompensated violations remained at about 3 to 2. That is, more violations were compensated than not, even when twice as many chairmanships were changing hands by means other than seniority. This is shown in Table 8.

Clearly, creating a coalition differs in its effects upon committee assignments from situations where a new Speaker had inherited a coalition or was acting to maintain a coalition. When there was a new Speaker but no party turnover, Speakers moved cautiously: these were the circumstances in which there were the fewest violations of seniority, as Table 4 indicates, and in which violations, when they occurred, were overwhelmingly of the compensated type. This is shown in Table 9.

Thus we can conclude that by far the most

TABLE 9. NEW SPEAKERS WITHOUT NEW MAJORITIES COMPENSATE WHEN THEY VIOLATE SENIORITY

	New Speaker No New Majority	Other Cases
Violations		
Compensated	77% [20]	58% [172]
Uncompensated	23% [6]	42% [123]
	100% [26]	100% [295]

leeway existed for Speakers when they came fresh to office on the heels of a party victory establishing a new majority in the House. Violations of seniority in other circumstances were much less frequent, and much more subject to compensation.

This suggests that for the period 1881–1910 a number of small but significant constraints upon the Speaker's *de jure* options were developing. They can be noted in the restraint which seems to have been exercised in the violation of seniority when Speakers acted without a party turnover to legitimize their manipulation of assignments to committee chairmanships.

IV. SPEAKER CANNON: A TRANSITIONAL FIGURE

Speaker Joseph Gurney Cannon (1903–1911) more often than any other Speaker is responsible for exceptions to the patterns we have been describing. This is consistent with an interpretation of the committee assignment process as a method—undoubtedly the most important method before 1911—by which Speakers maintained a supportive coalition in the House in behalf of policies favored by the majority party. When the Progressive movement became powerful at the Republican grass roots, as it did in the 1890's, it was only a matter of time before this was reflected in party insurgency in the House of Representatives.

House chroniclers make it clear that the insurgents' successful challenge to Cannon's leadership in 1910 laid heavy stress upon his arbitrary use of the Speaker's power of appointment. George Rothwell Brown quotes Representative Nelson of Wisconsin:

> "Have we not been punished by every means at the disposal of the powerful House organization? Members long chairman of important committees, others holding high rank—all with records of faithful and efficient party service to their credit—have been ruthlessly removed, deposed, and humiliated. . . ." [Brown continues:] The House knew as it listened to this merciless indictment of the Speakership that it was true. Members were there who had been removed from their committee places, because they had displeased the organization, through the exercise of power which had raised the speakership of Mr. Cannon to an unprecedented height.[26]

George Norris, a Congressman in that era, wrote long afterward:

> Every two years the members knew they were confronted with the appointment of the various standing Committees; and one man, the Speaker,

[26] Brown, *op. cit.*, pp. 158–159.

possessed absolute authority to do what he pleased in these selections. He held in his hands the political life of virtually every member. He could reward the faithful, and he could punish the 'guilty'. I doubt if any Speaker in the history of Congress was as ruthless as Joe Cannon sometimes was.[27]

Booth Mooney says, "[Cannon] stacked the key committees with men who would unquestioningly support everything he favored and oppose everything he was against. He arbitrarily took chairmanships away from members who tried to flout his authority."[28]

Cannon may indeed have been the most ruthless Speaker in House history,[29] but these and other complaints about his "ruthlessness" are hard to substantiate with a casual look at the figures we have. Of the six Speakers between 1883 and 1910, Cannon ranks next to lowest in his overall violations of seniority. (See Table 10.)

TABLE 10. VIOLATIONS OF SENIORITY BY SPEAKER 1881–1910

Speaker	Violations	Violations as a % of all appointments
Keifer (1881–83)	37	92%
Carlisle (1883–89)	70	59%
Reed (1889–91)	27	57%
Crisp (1891–95)	59	61%
Reed (1895–99)	55	53%
Henderson (1899–1903)	23	20%
Cannon (1903–1911)	50	21%

What the data provide are indications of important differences in the timing of his violations of seniority as compared with those of his predecessors. Cannon became Speaker after Speaker Henderson, also a Republican, for somewhat mysterious reasons decided to retire from Congress. While Speakers customarily rearranged committee chairmanships after party turnovers, as we have seen, the custom when there was no party turnover was pretty much to maintain the existing arrangements. In his first term, Cannon succeeded the retired Henderson as chairman of the Rules Committee, a procedure which violated the seniority of John Dalzell (who under Cannon became second ranked member of Ways and Means as well as of Rules) but which was well in keeping with House custom. Then he committed one violation on a semi-exclusive committee, Post Office and Post Roads, and four violations on minor committees. This constitutes the most restrained first term performance of any Speaker, including Henderson, although the latter restricted his eight first term violations to minor committees. In his second term Cannon transferred two incumbents and skipped over three nonincumbents—all on minor committees.

In Cannon's last two terms, there began an increase in factionalism in the Republican Party that solidified into the Progressive and Farmer-Labor insurgent movements. This split in the Republican Party found a focus in hot legislative battles over tariff and conservation measures. Cannon responded in part[30] by *increasingly* tinkering with committee chairmanships. (See Table 11.)

What Cannon did involved a number of innovations as compared with his immediate predecessors. He compensated potential chairmen less often (Table 12). Although he deprived incumbent chairmen without compensating them to about the same degree as his predecessors, (Table 13) he violated seniority without compensation to a much greater extent after his first term (Table 14). He deprived many potential chairmen of major and semi-exclusive commit-

[30] Charles O. Jones describes a number of the powers available to a Speaker in this era which could be used as strategic resources: "He could appoint committees—including the chairmen, determine the schedule of business, recognize members on the floor, appoint members to conference committees, dispense favors of various kinds. Particularly significant was Speaker Cannon's power as chairman of the Committee on Rules. . . . Speaker Cannon was not above delaying the appointment of committees until his wishes on legislation had been met. In the famous 61st Congress, he appointed the important Rules and Ways and Means committees on March 16, the second day of the session. Most of the remaining appointments had to wait until the Payne-Aldrich tariff bill was in the conference committee—nearly five months after the session began." "Joseph G. Cannon and Howard W. Smith: An Essay on the Limits of Leadership in the House of Representatives" *Journal of Politics* 30 (August, 1968), 617–646. tees (Table 15) and did so after his first term to an unprecedented extent (Table 16).

Bolles says, "Cannon drove his advantage home in the House by dismissing the most obstreperous progressives and other insurgents from the committees where they could do him harm. Cooper lost his chairmanship of Insular Affairs, and Norris lost his membership on Public Buildings and Grounds. Cannon removed Fowler as chairman of Banking and Currency, and he dropped Lindbergh from Indian Affairs. He put Lenroot to one side by assigning him to the inane Committee on Ventilation and Acoustics."[31] In the Sixtieth Congress (1907) he removed four incumbent chairmen from nonexclusive committees, giving them no new committee assignments. These four removals of incumbents after a Speaker's first term were unprecedented. (See Table 14) At the same time Cannon skipped over John A.T. Hull on Militia and Gilbert Haugen on War Claims—both men from Progressive Iowa, to reward Helvor Stienerson (Minn.) and Kittredge Haskins (Pa.) with chairmanships on these two committees. He also transferred Stevens Henry (Conn.), about to become chairman on Agriculture, to a low ranking position on Merchant Marine and Fisheries and gave Henry's chairmanship to Charles Scott (Kansas).

Insurgents opposed Cannon's reelection to the Speakership in the first session of the 61st Congress (March, 1909), and supported Democratic leader Champ Clark's attempt to change the rules and sharply curtail the powers of the Speaker.[32] Cannon fought back with the main weapon at his disposal. He made John Weeks (Mass.) chairman of the semi-exclusive Committee on Post Office and Post Roads, thus violating John J. Gardner's seniority, filled vacant chairmanships with low ranked members on Banking and Currency and Interstate and Foreign Commerce, and deprived three incumbents and five non-incumbents of their chairmanships on minor committees.

In sum, after a cautious beginning, Cannon committed a higher proportion of violations on major and semiexclusive committees after his first term than any Speaker (Table 16), more post first-term violations of the seniority of incumbents than anyone (Table 14), and more uncompensated violations after his first term than anyone. These irregularities became entwined with Cannon's legislative conservatism in the insurgents' ideology of anti-Cannonism.

Ultimately Cannon's maneuvers were not enough to stem the Progressive revolt in his party. This demonstrated that there were limits to the Speaker's ability to maintain his leadership position by depriving his opponents of chairmanships and awarding them to supporters. Cannon's problem seems to have been that he took over a relatively unified party and had little need at first to build a special supportive coalition. When the party began to split apart in his third term, he responded by attempting to maintain a workable coalition by dumping insurgent chairmen and rewarding loyal Republicans with chairmanships. In so doing he deprived more incumbents and chairmen of major and semi-exclusive committees, than had previously been done in the House. Cannon also resorted disproportionately after his first term to the strategy of demoting chairmen or jumping over potential chairman, rather than moving them to other committees. (See Table 17.) It is costlier to deprive an incumbent than a nonincumbent, a member of an exclusive committee than a minor committee. Likewise, it is costlier to demote than to transfer, and given the customary practice of previous Speakers, costlier to violate seniority after the Speaker's first term. Thus the costs of Cannon's efforts to maintain a supportive coalition are clear and his failure more understandable. It seems likely, then, that it was not the sheer number of his seniority violations that earned Cannon his notoriety as the House's most ruthless Speaker, but how and when they occurred.

Before 1911 each newly elected Speaker enjoyed a period in which he could build a supportive coalition, to maximize his party's legislative success or his own popularity or longevity as Speaker. During this period he could gain supporters by pursuing relatively low-cost strate-

TABLE 17. CANNON NOT ONLY CONTRIBUTES DISPROPORTIONATELY TO THE NUMBER OF UNCOMPENSATED VIOLATIONS OF SENIORITY IN GENERAL AFTER SPEAKERS' FIRST TERMS, BUT ALSO CONTRIBUTES DISPROPORTIONATELY TO THE NUMBER OF DEMOTIONS AND JUMPS

Type of Violation	Uncompensated Violations in Speakers' First and Later Terms					
	Speaker's First Term			After Speaker's First Term		
	1 All Speakers	2 Cannon	% 2 of 1	1 All Speakers	2 Cannon	% 2 of 1
Demotion or Jumps	23	3	13	19	6	32
Transfers to Other Committees	52	1	2	34	10	29

[32] See Hasbrouck, *op. cit.*, pp. 4–6.

gies. He could violate the seniority of fewer incumbents than nonincumbents, fewer members of exclusive committees than minor committees, and make fewer changes by internal shifts than transfers. After the initial phase, support became more costly. For each increment of support the Speaker had to expend more resources to employ each possible strategy. The longer the Speaker waited to form his coalition, the more probable it became that he could not afford to do so. Therefore the greater the likelihood he would either have to rely on seniority and give in to the legislative preferences of committee chairman, or resist their preferences and risk losing party support.

Similarly, the earlier a Speaker could build his coalition, the more he could rely on seniority in subsequent terms. Thus, even during the pre-1911 period, seniority had gained a foothold in the House of Representatives.

V. AFTER 1911: GROWING DECENTRALIZATION

After 1911, the power of appointment was taken from the Speaker and vested in party committees on committees, subject to the ratification (which was pro forma) of the whole House. For most of the first decade after this sweeping change, the appointment of chairmen was the business of the Democratic party, as the majority party in the House.

The revolt against Cannon did not immediately result in the decentralization of power in the House. Rather, power was shifted from the Speaker to the majority leader, Oscar Underwood, who chaired the House Committee on Ways and Means, the Democratic committee on committees, and led the Democratic caucus. George Rothwell Brown remarks:

> . . . The authority to name the committees of the House when taken from the Speaker was lodged theoretically in the most important committee of the House, but actually in the chairman of that committee. The Ways and Means Committee appointed the Committee on Rules, and the caucus adopted a resolution that no man should serve on more than one of the fourteen major committees.[33]

The Republican caucus had been destroyed by the revolt against Cannon, but not the Democratic caucus, with its two-thirds rule. In the 62nd Congress, rules changes were put through by the Democratic caucus vastly weakening the powers of the Speaker, with Speaker Clark's consent, but not decentralizing power in the House. The caucus was run by the Ways and Means committee, its chairman, and President Wilson. As American involvement in World War I increased, Wilson took more and more initiative and came to dominate Congressional activity.[34]

A recent study of the period observes:

> The emergence of the Democratic caucus as the real source of legislative power in the Congress was particularly galling to the insurgents. . . . Far from supplanting the caucus, Wilson relied upon it as his prime instrument of legislative power. Agreements on administration programs were hammered out in the Democratic congressional caucuses and then steam-rollered through Congress by solid Democratic majorities. In the standing committees Republican Congressmen and Senators, whether progressives or conservatives, were rarely allowed to play any significant part in the legislative process.[35]

The continued centralization of power in the first decade after the revolt against Cannon is reflected in our data as well. Table 18 shows a sizeable number of uncompensated violations of seniority in this first decade. When a potential chairman moved to a better committee, we interpreted the decision as also reflecting the influence of centralized power, since the shift had to be negotiated through the committee on committees. These two outcomes of seniority violation are contrasted in Table 18 with situations where members chose between chairmanships or themselves become party leaders, which we interpret as reflecting decentralization of discretion over the appointment process. The long-term trend toward decentralizaion is, of course, clear, and it emerges most strongly first in the decade of Republican dominance after the Wilson era, and continues on into the present day.

In 1919, decentralization took a major leap forward. In the election of 1918 the Republican party regained control of the House but was badly split between two leaders, James R. Mann of Illinois, a protege of Cannon (who was still serving in the House and active in party affairs), and the more progressive Frederick H. Gillett of Massachusetts. Gillett was elected Speaker on the first ballot, but did not fare so well in the Republican caucus on the matter of committee assignments, as the *New York Times* account indicates:

Total Violations	(321)	(63)	(103)	(60)	(5)

At 12:30 o'clock this morning it was announced that the Mann forces had routed the Gillett faction in the matter of the selection of the Committee on Committees. . . . Mr. Mann offered a [motion] providing that each of the Republican states having representation in the House . . . should elect a member of a Committee on Committees [and providing that] the members of this committee should each respectively have a voting power equal to the State's pro rata Republican membership in the House.

The duties of the proposed new form of Committee on Committees will be to elect the Republican members of the standing committees in the next House, to elect a Steering Committee of five, a Republican whip, and also a floor leader who should be ex officio Chairman of the new Committee on Committees, and likewise a Chairman of the Steering Committee.

The adoption of the Mann substitute was interpreted as indicating that the movement . . . [for] breaking down and overthrowing the domination of House committees under the rule of seniority of service has been blocked and defeated. The Mann substitute was probably adopted because the members who are holdovers and who have worked their way toward the top of the Republican side of the various committees want to retain the benefit of the rule of seniority. The adoption of the Mann substitute was interpreted as meaning that the House committees would be organized and their Chairmen picked in virtually the same old way, after the manner that put Southern men at the top of most of the important committees in both House and Senate in the [outgoing] Congress.[35]

Save for slight differences in the prose style, this passage, now nearly 50 years old, might have been clipped from the *New York Times* of today. In the decades that followed, the split in the Republican majority led to the formation of a legislative coalition with increasingly dissident southern Democrats. Party cohesion and majority rule through the caucus gave way to majority rule in the House based on a powerful cross party alliance which supported and maintained the seniority system.

The great profusion of minor committees up until 1946 gave party leaders a small amount of room for maneuver, however. Table 19 demonstrates that virtually all uncompensated violations of seniority in the period after 1910 involved the chairmen of minor committees. But even these, as Figure 4 shows, occurred predominantly during the first decade, when power was still centralized in the Democratic caucus.

The year 1946 marks the passage of the Legislative Reorganization Act, which reduced the number of committees from 48 to 19, principally by consolidating or abolishing minor committees and, in the process, liquidating large numbers of minor chairmanships. Since 1946, the seniority

[35] *New York Times* February 28, 1919.

TABLE 19. AFTER 1910 UNCOMPENSATED VIOLATIONS TAKE PLACE ON MINOR COMMITTEES

	1881–1910	1910–1963
Major	8% (10)	(0)
Semi-exclusive	22% (29)	4% (1)
Minor	70% (90)	96% (26)
	100% (129)	100% (27)

system has been virtually untouched, and chairmen have stayed put. The exceptions over two and a half decades are Omar Burleson, mentioned earlier, and Adam Clayton Powell, who was deprived of his chairmanship in 1967 in the course of proceedings which led to his exclusion from Congress altogether.[37] If 1911 signals the decline of uncompensated violations, 1946 marks the virtual demise of exceptions to the seniority system, as Table 20 illustrates.

But even before 1946, most exceptions to seniority reflected decentralized choices rather than the manipulations of party leaders. Here is a brief listing of the circumstances surrounding the eleven most recent violations of the seniority of a committee chairman in the House of Representatives, aside from the cases of Powell and Burleson.

(1) In the Republican-controlled 83rd Congress (1953–55), A. L. Miller of Nebraska became chairman of the committee on Interior and Insular Affairs. The ranking Republican member in the previous Congress, Fred Crawford of Michigan, failed to be renominated to Congress. The second ranking Republican, Dean P. Taylor of New York, whose seniority was violated, transferred to the Judiciary committee. Miller was third in seniority.

(2) In the 80th Congress, Richard Welch of California became chairman of the Public Lands Committee. He had been ranking member of three other committees in the previous Congress, two of which (Labor and Insular Affairs) ceased to exist in the 80th Congress when, under the reorganization of that year, they were combined with other committees. Welch's third committee in the 79th Congress was Merchant Marine and Fisheries, which he left to become chairman of Public Lands.

(3) In the 80th Congress, on the Committee on Merchant Marine and Fisheries, Fred Bradley of Michigan, second ranked Republican, became chairman when the ranking member, Richard Welch, took the chairmanship of Public Lands instead.

(4) In the 79th Congress the chairman of the Committee on Elections (Number 3) gave up his chairmanship and became ranking member. He took the chairmanship of the Committee on Territories instead.

There were seven other violations of seniority in the 79th Congress, involving the following committees: Election of the President and Vice President (previous chairman transferred to Agriculture); Irrigation and Reclamation (previous chairman, a congressman from silver-rich Idaho, transferred to the chairmanship of the Committee on Coinage); Memorials (previous chairman, retaining five other committee assignments, transferred to UnAmerican Activities); Enrolled Bills (a freshman member became chairman, violating the seniority of Mary T. Norton, who chose instead to become Chairman of Labor. She retained her position on Enrolled Bills as ranking Democrat rather than move up to the Chairmanship); Expenditures in the Executive Departments (ranking Democrat failed to move up); and Indian Affairs (previous

[37] Seniority has also been pretty much inviolate since 1946 for committee rank and file as well as chairmen. There are only two exceptions. It took an elaborate warning procedure followed by a fight in the full caucus of the House Democratic party in 1965 to impair the seniority of two southern House Democrats, neither of them chairmen, who had campaigned actively for Republicans in the election of 1964. One of these Democrats promptly resigned his seat and was reelected to Congress as a Republican. The other quit the House soon thereafter and became Governor of Mississippi. Under a rule of the Democratic caucus, the so-called Byrnes Rule, the Democratic committee on committees' assignments are subject to review by the caucus. In practice, however, except for these two cases, there has been no review. The overwhelming liberal Democratic majority of 1965, mobilized by the Democratic Study Group, was able to threaten a review and thereby opened the question of the seniority of these two members.

TABLE 20. THE DECLINE OF UNCOMPENSATED VIOLATIONS

	1881–1910	1910–1946	1946–1963
Compensated	59% (192)	88% (204)	(1)
Uncompensated	41% (129)	12% (27)	(0)
	321	231	1

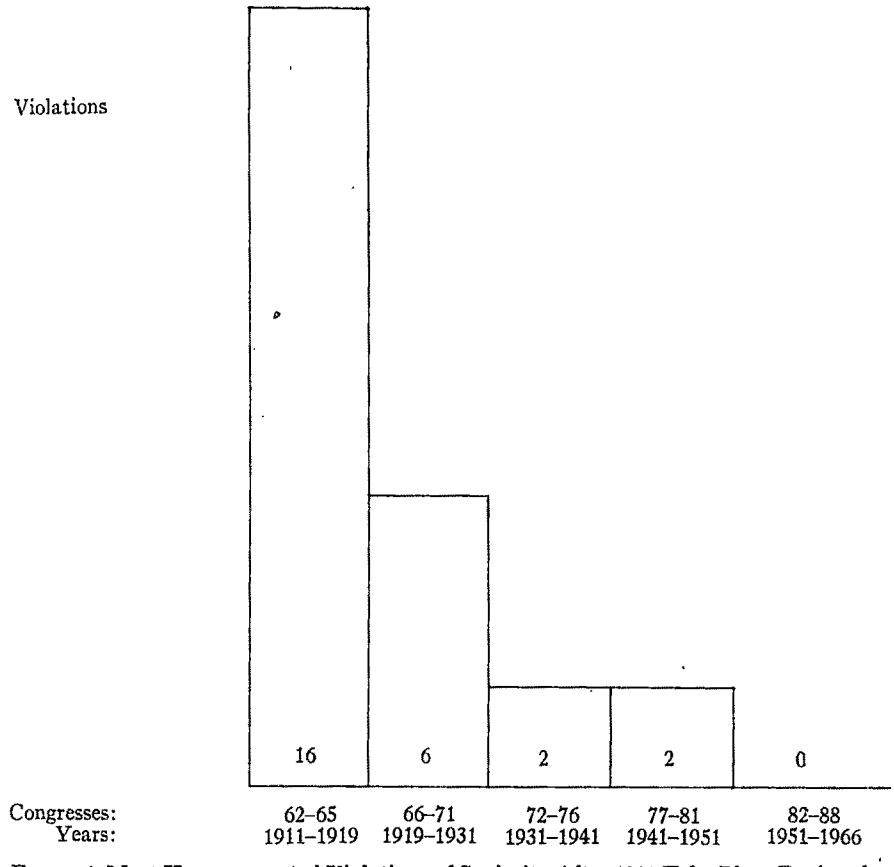

FIGURE 4. Most Uncompensated Violations of Seniority After 1910 Take Place During the Period of Democratic Caucus Centralization

chairman and ranking Democrat failed to return to Congress; third ranking man, Samuel Dickstein of New York, moved up to second place but did not take the chairmanship. Dickstein was at the time chairman of the Committee on Immigration and Naturalization; no doubt there were more immigrants than Indians in his lower east side Manhattan constituency).

The seniority violations after 1919 appear to reflect not the Speaker's discretion, or the discretion of a leadership committee, but rather the application of a norm that no member should chair more than one committee. The exercise by members of their preferences in this connection was capable of setting off chain reactions reshuffling large numbers of committee chairmen; this accounts for the fact that even after 1919 there were a sizeable number of seniority violations. However, the main mechanisms at work before 1911, from 1911 to 1919, and thereafter seem quite different.

Party leaders did retain some room for maneuver, even in the post 1911 situation, owing to the large number of minor committees. When vacancies on important committees opened up, party leaders could offer senior men on minor committees the vacancy and thereby manipulate minor committee chairmanships. This option was effectively closed by the Legislative Reorganization Act of 1946, which reduced the number of committees and also vastly cut down on the number and diversity of manipulable vacancies available at any one time.[38] And, of course, as

[38] It also increased the difficulty for any member of attaining a chairmanship. Richard Brooks shows a tremendous contrast in the average number of years a member had to serve before becoming a committee chairman before and after 1946. From 1889–1910 the average wait was 6.1 years. From 1911–1946 the average wait was 7.5 years. From 1947–1954 chairmen served in the ranks an average of 16.6 years. Richard Stephens Brooks "The Sectional and Seniority Bases of the Standing Committee Chairmanships in the U.S. House of Representatives, 1889–1954" (unpublished Ph.D. dissertation, University of Oklahoma, 1956), p. 89.

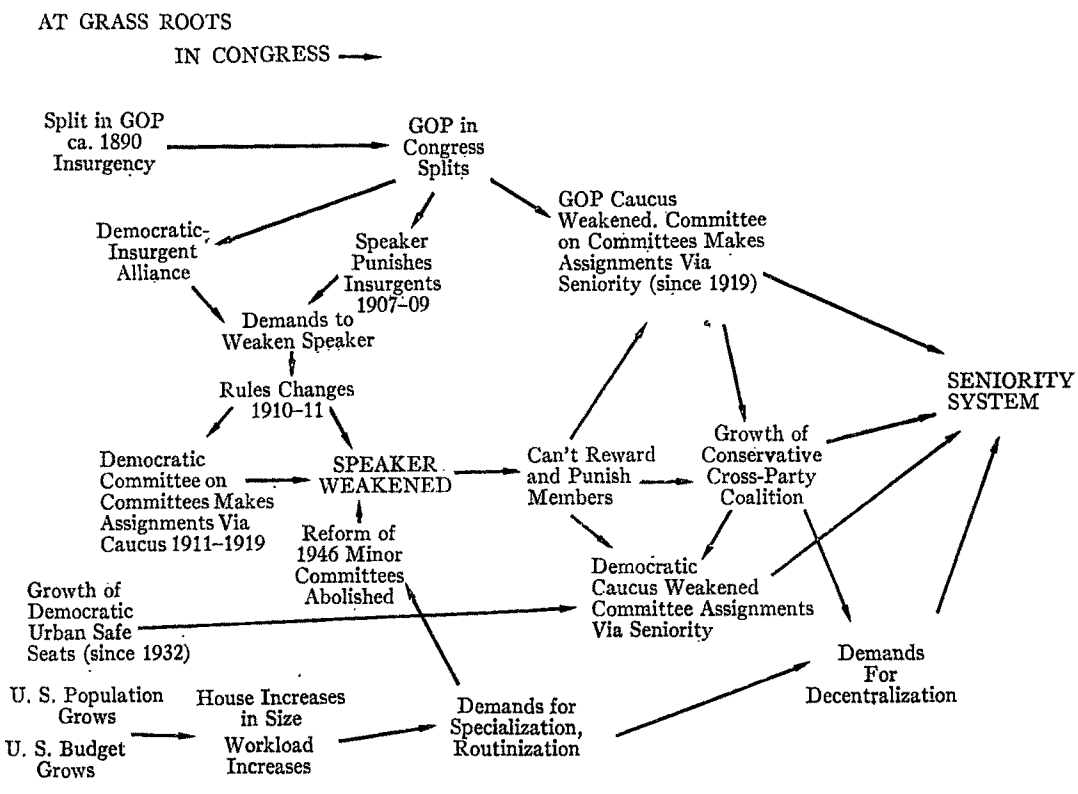

FIGURE 5. Historical Causes of seniority sytem

the number of committee places diminished, the committee assignments of individual members were limited in most cases to only one committee.[39]

VI. CONCLUSIONS

What caused seniority? Historically, the answer seems to have been a split in the grass roots of the Republican party that ultimately produced a strong but unstable Democratic-Insurgent Republican majority coalition in the House—strong enough permanently to weaken the prerogatives of the Speaker, unstable enough to preclude the election of a strong Speaker of their own.[40] One of the consequences of this split was the reinforcement of weak preexisting norms favoring continuity of chairmanships and limiting in practice the freedom of Speakers to appoint chairmen when there was no party turnover. After the Democratic-Insurgent coalition weakened the power of the Speaker and of the Republican caucus, only the Democratic caucus was left as a centralizing force in the House. The Democrats lost control of the House in the 1920's, and in time a conservative cross-party coalition undermined the Democratic caucus.[41] Meanwhile, longer term pressures for routinization and specialization were having marginal effects. Ths is the complexly interrelated set of historical "causes" of seniority as it exists today that we try to diagram in Figure 5.

Seniority is also an ongoing social process that helps to maintain itself by creating conditions favorable to its own perpetuation. Our speculation as to the important causal relations in this process, and their connections with the processes that established the system, are diagrammed in Figure 6.

To summarize, we believe that our data show the effects of four main influences upon the growth of the seniority system in the U.S. House of Representatives. In the period between 1881 and 1911, a large number of committees

[39] See Lewis C. Gawthrop, "Changing Membership Patterns in House Committees" this REVIEW, 60 (June, 1966), 366–373.

[40] Holt *op. cit. passim* makes this argument very persuasively.

[41] On the present-day weakness of the Democratic caucus, see Clem Miller *Member of the House*, John W. Baker, ed. (New York: Scribner, 1962), pp. 88–89, 92.

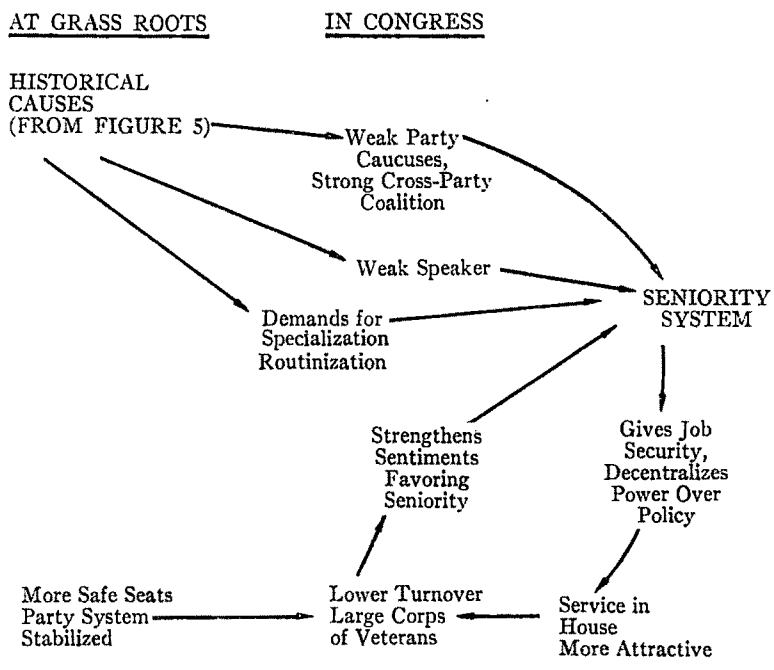

FIGURE 6. Now seniority maintains itself

and a discretionary system of appointment in which seniority and political considerations played a part produced a pattern of relatively frequent violations of seniority. Many of these were responsive to the necessity for new Speakers, after a party turnover in the House, to organize a majority coalition in the committees. After 1911 the system responded at first to the centralized decisions enforced by the Democratic caucus, and later to piecemeal bargaining and tinkering, as Representatives with many committee assignments adjusted their workloads with respect to a large number of narrowly focused committees. This produced some violations of seniority, but within a context providing much less power and discretion for party leaders in the House. After 1946, both the discretionary rights of leaders and the rich array of minor committees disappeared with the "streamlining" of the committee system, and thus from 1946 onward, the rule of seniority is virtually never breached. From a situation where seniority is one of a number of criteria determining committee chairmanships, then, we move through two intermediate periods, where centralized coordination of appointments is first undermined in the Republican party (1910) and later (after 1919) in the Democratic. Finally, the House moves after 1947 to a situation where there exists a full-blown seniority *system*, in which seniority is the single, automatic criterion determining the chairmanships of all committees, and the application of this criterion is not subject to the discretion of any body short of the relatively inactive full party caucuses.

These results are compatible with the argument that power in the House has decentralized rather than concentrated over time. They also reflect a general trend, discussed elsewhere, toward impersonal, automatic, and universalistic methods of conducting internal business, a characteristic pattern in the development of social organizations as they move from tentative, informal, and less complex stages toward institutional maturity.[42] It is an interesting anomaly that these two phenomena, progressive decentralization of power and institutionalization, are not normally associated, and that "ideal types" describing the natural history of organizational development typically presume a movement toward, rather than away from, concentration of power. The House of Representatives may be the exception that proves the rule, or it may serve as an occasion for the reconsideration of at least one small branch of organization theory.

[42] See Nelson W. Polsby, "The Institutionalization of the U.S. House of Representatives," this REVIEW, 62 (March, 1968) pp. 144–168. The present discussion supersedes, and in some respects corrects, the preliminary findings on seniority offered there on pp. 160–161.

SOCIAL STRUCTURE AND POLITICAL PARTICIPATION: DEVELOPMENTAL RELATIONSHIPS, II*

NORMAN H. NIE**
University of Chicago

G. BINGHAM POWELL, JR.
University of California, Berkeley

KENNETH PREWITT
University of Chicago

Mass political participation increases as nations become more economically developed. In Part I of this study we attempted to identify the significant social experiences which explain the high levels of participation in economically developed nations. We formulated and explored the following general theory:

Economic development alters the social structure of a nation. As nations become more economically developed, three major changes occur: (1) the relative size of the upper and middle classes becomes greater; (2) larger numbers of citizens are concentrated in the urban areas; and (3) the density and complexity of economic and secondary organizations increases. These social changes imply political changes. Greater proportions of the population find themselves in life situations which lead to increased political information, political awareness, sense of personal political efficacy, and other relevant attitudes. These attitude changes, in turn, lead to increases in political participation.

The theory can be presented schematically in the following form:

A	→	B	→	C	→	D
Economic Development		Alterations in the Stratification, Urban, and Group Membership Patterns		Changes in the Distribution of Attitudes and Cognitions		Increases in Political Participation

* Various institutions and individuals have been of considerable help to the authors in the preparation of this research. The department of Political Science, Washington University, provided summer support to two of the authors at an early stage of data preparation. Under NSF grants, the computation centers at both Washington University and Stanford University made machine time available. The facilities and the personnel of the Stanford Institute of Political Studies, particularly Mr. C. Hadlai Hull, the Institute's computer consultant, were invaluable aids to the completion of this research. The Department of Political Science of the University of California, Berkeley, provided funds to help us prepare the final draft for publication. For critical comments we are indebted to many readers, in particular to Sidney Verba, Hayward R. Alker, and Duncan MacRae, as well as to Warren E. Miller, who, as a referee for the REVIEW, made a major contribution to the current version of the paper. Other, more specific, debts are acknowledged below. Part I appeared in this REVIEW, 63, (June, 1969).

** The authors are listed alphabetically to indicate equal coauthorship.

We were able to demonstrate that individuals' levels of social status and organizational involvement were strongly and consistently related to their levels of political participation.[1] The survey data from five nations showed, further, that organizational involvement was more strongly related to participation, and more consistently from nation to nation, than was social status.[2] Residence in an urban area, contrary to

[1] See our "Social Structure and Political Participation, I," Appendix B, this REVIEW, 63 (June, 1969), for the multiple item scales used to test these relationships. Social status includes individual's education, income, occupation, and an interviewer estimate. Organizational involvement includes primarily number of organizational memberships and having held an office in an organization. Participation includes talking politics, contacting local officials, contacting national officials, and joining formal political parties or organizations—but not voting.

[2] The survey data are taken from the Almond-

our initial theory, was shown *not* to be related to individual political participation, although we did find an interesting sub-pattern.[3] More advanced nations had, of course, more citizens residing in urban areas, but these individuals did not participate in politics more frequently than their rural counterparts in the same nation.

After establishing that social status and organizational involvement consistently predicted rates of political participation, we merged the survey data with aggregate data on the level of economic development of the five nations. We were able to devise several different ways to examine how much of the inter-nation correlation between economic development and participation could be explained by reference to changes in the class structure and organizational life of a nation. Although it was difficult to provide a clear test with only five national cases, our series of tests pointed uniformly in a single direction. There were no development-related differences in mass participation which were not explained by differences in the status and organizational structure variables. That is, insofar as mass participation is related to economic development, such participation is best understood by analyzing how economic development affects the distribution of social status positions and the development of organized group life. Finally, although we observed some idiosyncratic differences in political participation from one nation to another, these differences were minor when compared with the general pattern: citizens of similar social class and organizational involvement participate in politics at about the same absolute level irrespective of the nation in which they reside.

Having explored, as far as our limited number of national cases would allow, the relationships between economic development, social structure, and participation, we turned our attention to the role of political attitudes and cognitions. Our theory suggested that changing attitude patterns constituted the link between social structure and political participation. Aggregate rankings tended to support this possibility. The mean levels of political information, political efficacy, political attentiveness, and citizen duty to participate were consistently higher in the more developed nations, although there were a number of variations within the pattern.

But average or aggregate measures of individual characteristics cannot be used to examine systematically the pathway from development to participation. More sophisticated methods of analysis are needed to explore the theory that social changes are related to participation because they change political socialization patterns. The primary objective of this part of the study is to utilize a technique of causal modeling to investigate the attitudinal and cognitive pathways from individuals' positions in the class structure and their involvement in the society's organizational life to their levels of political participation. Although we cannot, of course, prove causality in the direction of the relationship, we can raise the following questions concerning these pathways:

(1) Which, if any, of the political attitudes and cognitions introduced represent potential causal links between social status and organizational involvement on the one hand and political participation on the other? How much of the relationship between B and D in our schematic theory can be explained by such attitude linkages?
(2) Are there different attitudinal paths associated with social status and with organizational involvement? That is, we shall attempt to determine if the citizen who participates in politics because of his social status differs in his political attitudes from the citizen who participates because of his organizational involvement.
(3) Do the interrelationships among status, organizational involvement, political attitudes, and political participation remain consistent from one nation to the next; or are there significant differences?

Addressing ourselves to these empirical questions leads to several other very interesting problems in the analysis of political participation. Whereas in Part I of this study we were able to say some rather definite things about how economic development affects the *level* of mass political participation, in Part II we shall be able to make statements about the relative

Verba Five-Nation Study. The five nations represented are Germany, the United Kingdom, the United States, Mexico and Italy. See Gabriel A. Almond and Sidney Verba, *The Civic Culture* (Princeton: Princeton University Press, 1963), for information on samples and survey design. See Part I of this study, this REVIEW, 63 (June, 1969), for an extended discussion of methodological issues related to how we processed these data.

[3] The size of community in which a citizen lives is negatively related to his local political participation level. However, this negative relationship is not sufficiently strong (it explains less than two percent of the variance in local participation) to account for the absence of any relationship between place of residence and general political participation. We concluded that although urbanization is a major part of economic development, it is not, even in part, responsible for great increases in mass political participation.

contribution of different groupings in the society to the participant stratum. This we can do in two ways. We can consider the degree of under- or overrepresentation of different class groups among citizens actively involved in politics. We can also consider the degree to which politically active citizens are likely, under various conditions, to manifest particular types of political attitudes and cognitions.

Assumptions of our causal model.—The use of statistical causal modeling techniques is gaining acceptance in political science.[4] The analysis undertaken here differs somewhat, however, from usual formulations. We are not using causal inference to eliminate logical alternative models. Rather, we are using it to examine the relative importance of various proposed linkages in a given model. The causal order to independent and dependent variable is fixed. Further, we are not interested in the causal priority of the hypothesized intervening variables. Our research question is whether the five attitude variables explain the persistent relationship between a citizen's socioeconomic traits and his rate of political participation, and, in addition, which of the five provide the strongest links in the chain. Because each link relates to a specific hypothesis and thus has considerable theoretical interest to us, we do not wish to eliminate any of them completely, at least at this time, but instead attempt to assess their relative importance.

For this purpose, as suggested by Otis Dudley Duncan,[5] the simplest procedure is not to construct prediction equations specifying certain relations—usually zero ones—but to compute path coefficients for the given model.[6] The direct path linkages between independent and dependent variables, for example, will be zero if the partial correlations would have been zero. Where not zero, we are able to derive measures of proportional importance in the total relationship. This is the procedure followed.

We must, of course, take note of some of the assumptions which are made in employing these techniques.[7] First, relationships between all vari-

[4] For example, see Hubert Blalock, "Causal Inferences, Closed Populations, and Measures of Association," this REVIEW, 61 (March, 1967), 130–136; Hubert M. Blalock, *Causal Inferences in Non-Experimental Research* (Chapel Hill: University of North Carolina Press, 1964); Warren E. Miller and Donald E. Stokes, "Constituency Influence in Congress," this REVIEW, 57 (March, 1963), 45–56; Arthur S. Goldberg, "Discerning a Causal Pattern among Data on Voting Behavior," this REVIEW, 60 (December, 1966), 913–933; and Donald J. McCrone and Charles F. Cnudde, "Towards a Communications Theory of Democratic Development," this REVIEW, 61 (March, 1967), 72–79. We owe a particular debt to the excellent discussion by Hayward R. Alker, Jr., "Causal Inferences and Political Analysis," in Joseph Bernd (ed.), *Mathematical Applications in Political Science II* (Dallas: Southern Methodist University Press, 1966), pp. 7–43.

[5] Otis Dudley Duncan, "Path Analysis: Sociological Examples," *American Journal of Sociology*, 72 (July, 1966), 6–7.

[6] These path coefficients are the standardized B (slope) coefficients for a series of regression equations. The causal model is described by these simultaneous equations. The causal properties are linked to the fact that each succeeding equation adds a new variable to the model—and is described as a dependent variable "caused" by all preceding variables in the model, but by none of the ones subsequently added. The final dependent variable, participation in this case, is the product of all other variables. All equations after the first two ($X_2 = B_{21}\ X_1 + B_{2t}\ R_t$, and $X_1 = B_{1s}\ R_s$) are shown in the left hand column in Table 2. As Blalock, *op. cit.*, has suggested, unstandardized b weights provide rich interpretations that these standardized path coefficients do not. However, the scores obtained on the variables in our model are based in many cases on originally arbitrary variances. The different questions on competence, for example, had different numbers of alternative responses and even the meaningfulness of the zero points is not clear on an attitude variable of this type. In this situation the interpretation of the unstandardized scores is clearly very difficult. See the comments by John W. Tukey, in "Causations, Regression, and Path Analysis," in Oscar Kempthorne, *et al.* (eds.), *Statistics and Mathematics in Biology* (Ames, Iowa: Iowa State College Press, 1954). However, we do hope to examine unstandardized coefficients in models involving non-attitudinal variables only, particularly in regard to the lines of inquiry raised in the section on "Social Structure and the Participation of Class Groups," below, in future analysis.

[7] For a more complete discussion of these limitations see Alker, *op. cit.*; Duncan, *op. cit.*; Raymond Boudon, "A Method of Linear Causal Analysis: Dependence Analysis," *American Sociological Review*, 30 (June, 1965), 365–374; and Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," this REVIEW, 62 (December, 1968), 1258–1264. Although the useful Forbes and Tufte discussion was not available to us while this analysis was being conducted, we believe that our approach to causal modelling avoids many of the problems raised by them. We must continue to emphasize, of course, that the causal *order* of our variables is posited from deductive theory, not derived from the data.

ables are assumed to be additive and linear. Second, other causes of each of the eight variables are assumed to be uncorrelated with each other or other variables in the system.[8] Third, all causal relationships are assumed to be unidirectional, rather than reciprocal. This third assumption seems tenable in terms of the position of the independent variables (status and organizational involvement). It is obviously less satisfying and plausible in terms of relationships among the attitude variables and between attitudinal and participatory variables. At the moment this problem cannot be avoided.[9] We believe that it has little effect on the relationships between independent and dependent variables as they emerge in the causal model, but we present findings about the relative position of attitude variables in a more tentative vein. At a future date we hope to explore interactive models. Fourth, the assumptions of the specific causal order have been made for purposes of this analysis, and face the same problems as the assumption of unidirectionality.

In addition to these statistical assumptions, we should note that we are undertaking, in effect, analysis of a longitudinal causal pattern through cross-sectional analysis. Obviously, there is no substitute for over-time observation in finally ascertaining the development of patterns of political participation for various individuals of different social positions. This is a standard problem in analysis of political behavior, given the time and cost requirements of longitudinal observation, but it should be noted nonetheless.

I. THE FINDINGS: DIFFERENCES IN THE CAUSAL LINKAGE PATTERNS OF SOCIAL STATUS AND ORGANIZATIONAL INVOLVEMENT

We begin with the very general hypothesis that the causal relationship between social status and organizational involvement, on the one hand, and political participation, on the other, can be traced through intervening political attitudes. Figure 1 and Table 1 present data relevant to this hypothesis.

Initial examination reveals one pattern of overwhelming strength and consistency: social status and organizational involvement operate through quite different causal paths in their impact on political participation. This finding holds true in all five countries and remains the case in spite of various manipulations of the data, alteration of the order of the intervening variables, changing the number of the intervening variables, and the like.

The basic finding is both simple and important. Virtually all the relationship between social status and political participation is explained by the intervening linking attitude variables. The high social status citizen does not *just* participate in politics; he does so only when he has the attitudes such as efficacy and attentiveness which are postulated as intervening variables. Social status, then, affects rates of political participation through its effect on political attitudes. This does not mean, it must be emphasized, that the correlation between status and participation is spurious; on the contrary, it means that intervening attitude variables explain *how* a citizen's social status affects his political activity.

On the other hand, a very large part of the relationship between organizational involvement and participation *is unexplained by any variable in this model.* In every case, about 60 percent of the correlation between organizational involvement and political participation is accounted for by the direct link, that line that does not pass through social class or the attitudinal variables. (See link 2 → 8 in Figure 1).

The strength and cross-national consistency of this pattern is shown as well in Table 1. In a causal model of this type, the raw correlation (Pearson Product-Moment) between independent and dependent variable equals the sum of all pathways down the causal chain from independent to dependent variable.[10] The score of a "pathway" in this sense is the product of all path coefficients along the chain. Table 1 presents the percent of the raw correlation between social status and organizational involvement, on the one hand, and political participation, on the other, accounted for by: (1) the direct relationship only, unaccounted for by other variables in the model; (2) the path through the other inde-

[8] Urbanization has been deleted as a variable in the model, since we know it to be significantly related to Social Status only, of all the variables in the model, and its deletion greatly simplifies calculation of paths. Deletion of urbanization is a violation of this assumption, in a minor fashion, when considering local participation only, rather than combined scales. It is therefore reintroduced below when considering the causal models of local and national participation separately.

[9] Nonrecursive path analysis is also possible. At a future point we hope to explore further interactive models for this and similar data. We have not yet moved to this stage of analysis. See Duncan, *op. cit.*

[10] In the eight variable causal model there are 54 paths from status to participation. No paths moving back along the model at any point are allowed by the constraints imposed.

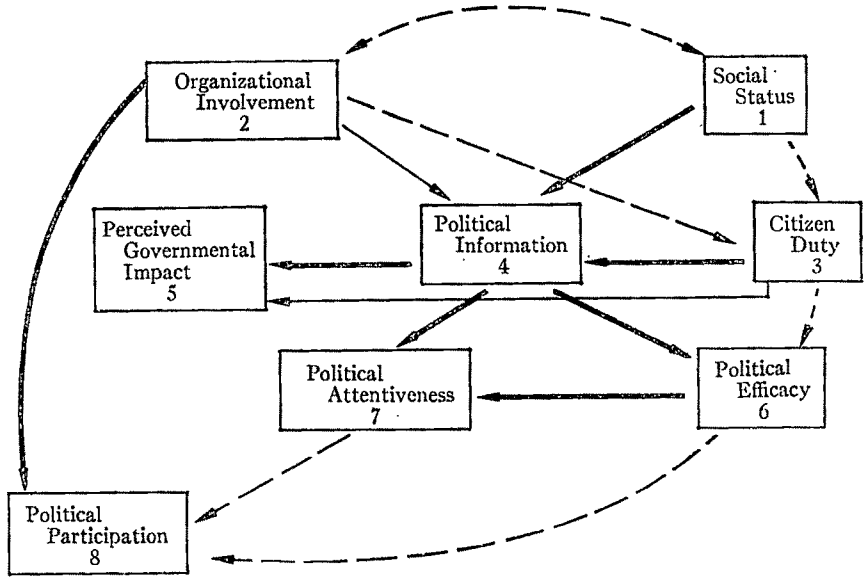

FIG. 1. Eight variable causal model: paths from status and organizational involvement to political participation

Key to Figure 1:

(1) No arrow between variables indicates that the path coefficients are less than .150 in at least three of the five nations. There are 13 paths *not* shown in the figure.
(2) Heavy arrows between variables indicate path coefficients greater than .250 (about 5 times the average standard error) in at least three of five national samples. Light arrows between variables indicate path coefficients between .150 and .250 in three or more of the five national samples.
(3) Unbroken arrows (both light and heavy) indicate *difference* between largest and smallest of the five coefficients is *less* than .150 (about 3 standard errors). Broken arrows between variables indicate a difference greater than .150.
(4) See Table 2 below for full path coefficients for each nation. Variables are explained in text, footnotes, and appendix. All linkages shown are positive.

TABLE 1. PATH COMPONENTS OF RELATIONSHIP BETWEEN TWO INDEPENDENT VARIABLES AND POLITICAL PARTICIPATION AS PERCENTAGES OF TOTAL CORRELATIONS[a]

	Independent Variables									
	Social Status					Organizational Involvement				
Proportion of Correlation Attributable to:	US	UK	GER	IT	MX	US	UK	GER	IT	MX
(1) Direct link to participation	20%	−8%	−33%	−15%	−1%	57%	62%	61%	51%	68%
(2) Paths thru other independent (1 or 2 variable only)	30	30	35	27	34	7	−2	−3	−2	0
(3) Paths thru other ind var *and* attitude variables	10	12	20	21	13	14	12	6	12	6
(4) Paths thru attitude variables only	40	61	78	67	54	20	25	35	40	26
Total percentage	100	95	100	100	100	98	97	99	101	100
Basic correlation between ind var and participation	.431	.303	.181	.283	.238	.523	.480	.486	.490	.515

[a] Path coefficients from Table 2. The correlations are equal to the sum of all pathways from independent to dependent variable. The pathways are computed by multiplying all path coefficients along the given path. Negative scores arise from negative path linkages. For those percentages, each independent variable is treated as if it were the first, undetermined, variable in the chain. Key: US = United States; UK = United Kingdom; GER = West Germany; IT = Italy; MX = Mexico.

pendent variable only; (3) the paths going first through the other independent variable and then through the attitude variables; and (4) the paths going directly from each independent variable through the attitude variables to political participation. For example, the correlation between organizational involvement and political participation in the United States is .523. Fifty-eight percent of *this* is accounted for by the direct path between these two variables (that is, the path that passes through no other variable in the model). Seven percent of the correlation between these two variables is accounted for by the path from organizational involvement to social status and then directly to participation; 14% of the correlation is explained by the path from organizational involvement through social status and then through the intervening attitude variables; and the remaining 21% of the correlation is accounted for by the path from organizational involvement through the various attitude variables but by-passing the social status variable.

The structure of the components of the organizational involvement relationship are almost uncannily consistent from nation to nation. The social status to participation relationships are less consistent, with the U.S. having a fairly large proportion accounted for by the direct link (although the path coefficient is less than twice the standard error and would not usually be considered statistically significant). In Germany the direct link between social status and participation has a high negative score, although the percentage is exaggerated by the weakness of the total correlation (and the score is also less than twice the standard error).[11] The basic pattern, nonetheless, is clear, and we suspect inconsistency reflects in part, at least, some of the problems in adequate measures of social status, or its sub-dimensions.

The general pattern for social status finds about 60 percent of the relationship going through the attitude variables, about 30 percent going directly through organizational involvement, and about 10 percent going through the attitude variables by way of involvement. The general pattern for organizational involvement shows about 60 percent accounted for by the direct link, about 30 percent going through the attitude variables only, and about 10 percent going through social status and then the attitude variables.

Thus, a large part of the relationship between organizational involvement and political participation cannot be explained by reference to other variables included in the model. It is clear that those who are organizationally involved participate in politics at rates far greater than citizens who are not involved. In addition, and of considerable importance, many citizens whose organizational involvement propels them into political life are *not* more politically informed, politically efficacious, or politically attentive than the non-participants. Unlike political participation stemming from high social status, participation stemming from organizational membership does not necessarily imply those attitudes normally thought to be associated with democratic political participation. We return later to the implications of these findings.

There are two alternative, though not mutually exclusive, explanations for why the organizationally involved are politically active even though they lack certain attitudes. First, organizations can mobilize their members toward political goals; and this can occur without an intervening state of changes in attitudes by the members. The organizations might provide inducements and gratifications to their members, such as sociability, which though producing political activity have nothing to do with political information, awareness, and so forth. Further, the organizations can mobilize members for relatively specific, short-term issues, a mobilization which again does not depend upon any facilitating attitudes other than a willingness to follow the lead of the organization leadership. A professional or business group circulating a petition to be signed or a union enjoining their members to vote are examples of such mobilization.

Second, both organizational and political involvement might be strongly affected by an underlying personality attribute or cultural norm. For instance, both types of activity might be related to a general propensity toward social activism which is unrelated to social status. This

[11] At an earlier stage in the analysis, scales were built with consistency checks on the SES dimension. Persons high on one status item and very low on another were deleted. This procedure increased correlations, but decreased the size of the valid sample, and was not, therefore, used in this analysis. It is especially noteworthy that while only about 10% of the original samples in the US, UK, Italy, and Mexico failed to meet the SES dimension consistency check, about *50%* of the German sample failed to meet it. This suggests the disruption of the social stratification system in Germany as a consequence, no doubt, of the historical upheavals. The strong wage position of workers in the post-war boom, following the leveling impact of World War II and the Third Reich, may also be a contributing factor. See the comments by Lewis J. Edinger, *Politics in Germany* (Boston: Little, Brown, 1968), pp. 19-30.

explanation implies that joining an organization, becoming active in it, and getting involved in politics are subsets of a more general social behavior which, for reasons of personality attributes, is more attractive to some citizens than others. It is an explanation stressing self-selection.

This is not the place to explore the merits of these alternative explanations—and the data available permit no direct test—but we do suggest that the former explanation has more merit than the latter. The self-selection hypothesis is weakened since we would expect a self-selective tendency to correlate with attitudes such as political efficacy and attentiveness. The absence of strong relationships between organizational involvement and these attitudes makes us suspicious of the self-selection explanation. The first explanation, that organizations are mobilizing their members, is intuitively more persuasive and has been supported by additional research. Data collected in the United States show that membership in organizations which have some relationship to public affairs and which have formal or informal discussions of politics at meetings, greatly increases the likelihood of being politically active. In contrast, members who belong to more apolitical organizations are only slightly more likely than non-members to participate in politics.[12]

II. FIVE INTERVENING VARIABLES AND PROVISIONAL HYPOTHESES ABOUT POLITICAL PARTICIPATION

An eight variable model is rather complex for adequate pictoral representation. Nonetheless, we felt that each of the intervening variables contributed to the theoretical richness of the model. Figure 1 presented a composite path diagram. The strongest path links in absolute terms are heavy arrows. "Strongest" means, here, more than five times the average standard error for all relationships (which is about .050). Somewhat weaker relationships, but still stronger than three times the average standard error in a majority of the nations, are shown as lighter arrows. Where there is a range of more than three standard errors (average) between highest and lowest coefficients, the arrow is shown with a broken line to indicate a less consistent relationship. (See the Key to Figure 1 for a more precise description.)

Table 2 shows the exact coefficients on which Figure 1 is based; Appendix I presents the corresponding standard errors. For a random sample, we would say that path coefficients which are more than double the standard error are statistically significant. However, given the problems in accurately estimating the real nature of the sample used in the five nations, we prefer simply to emphasize that the relationships are quite consistent, that some are relatively strong, and that others, such as the direct link between social status and participation, are always weak.[13]

Of course we are less confident about the ordering of the causal model as it pertains to the different attitudinal variables than we are about the independent → intervening → dependent ordering. There is, indeed, a high probability that a number of these attitude variables have an interactive relationship of the type disallowed by the conditions of the model. Thus any observations we make about the relative importance of these relationships must be suggestive rather than definitive.

Variables 1 and 2 in the model are, of course, social status and organizational involvement. These are the independent variables, as we have discussed. They are mildly related (except in the U.S. where the relationship is stronger). We assume that status is probably prior in the causal ordering: an individual's education, occupation, income, and life style tend to be established by his family background, and are less often a product than a cause of organizational involvement. But for analysis purposes, we treat these as the two independent "first cause" variables.[14] For that reason they are linked by a double

[12] This research, carried out by Sidney Verba and Norman Nie, shows that a great majority of all types of voluntary organizations in the U.S. have an interest in public affairs and members engage in political discussions; this accounts for the strong relationship between organizational involvement and participation even when not controlling for the type of organization. These findings are based on preliminary analysis of the U.S. data from the "Cross National Research Program in Social and Political Change."

[13] As is described in Gabriel Almond and Sidney Verba, *The Civic Culture* (Princeton: Princeton University Press, 1963), pp. 509–525, the national samples were cluster samples and collected in somewhat different ways with different degrees of success. In Mexico, as noted, no interviews were collected in towns under 10,000. Given these differences and the fact that much of the sampling data was not available in our analysis tapes, we have not attempted to compute a sampling error—it could only be a guess—and prefer to rely on the strength and consistency of relationships, rather than significance tests presuming probability samples. See the comments on significance of correlation coefficients in Part I, Table 1, this REVIEW, 63 (June, 1969).

[14] See Duncan, *op. cit.*

arrow in Figure 1. We have noted the differences in the causal linkages from these two variables to participation. Each of the subsequent variables is drawn from the literature on attitudes and participation, and these variables can be linked to participation in a series of complementary hypotheses. Our data permit us to comment on these, and their relative importance in the causal chain specified by this model, although we stress that these must be considered provisional observations, not tests of the hypotheses.

Obligation to participate.—Variable 3 measures the sense of citizen duty to participate.

The scale was constructed from replies indicating the degree of active participation mentioned by respondents when enumerating the duties of a good citizen. Commentators on democratic participation have hypothesized that higher social status and organizational involvement expose the citizen to value systems approving of the act of participation.[15] Political participation as a value is taught in the schools, reiterated in mass media, and reinforced as a norm in general social interaction. The variable is interesting because prevalence of such participatory norms would not seem an intrinsic part of the developmental process, but rather a special outcome of conditions and political education efforts in particular societies.

The data in Table 2 suggest that citizen duty does, indeed, play a part in the propensity of citizens in these five nations to become involved in politics as they become more organizationally involved and better educated. However, there is very considerable variance from nation to nation, both in the strength of the relationship and in the linkages to the independent variables. In some nations this variable is more strongly linked to group involvement than status. This variation is, indeed, what we might expect from a political orientation related to particular patterns of socialization, current and historical. In each of our five nations from 10 to 22 per cent of the correlation between status and participation is explained by paths through civic duty. Civic duty operates almost purely as an intervening variable: its effect on participation is felt through subsequent links to information and efficacy. That is, motivation through sense of an obligation to participate increases one's tendency to get information about politics and feel confident in political expectations, but does not directly propel one into the political arena.

Information as a political resource.—Variable 4 measures citizen knowledge of national political leaders and high governmental affairs, basic indicators of political information. The developmental hypothesis suggests that higher status and organizational involvement expose citizens to communication stimuli of all kinds, informing them in general and, hence, about political events in particular.[16] Information in turn, it is presumed, increases citizens' sense of competence, promotes awareness of a stake in public policies, and provides a basic interpretative resource for following and understanding public affairs. This is a type of factor which would seem intimately linked to the developmental process, particularly to increases in general levels of education and growth of mass media, as an intervening attitudinal resource for mass participation.

The data tend to support this hypothesis quite firmly. Information is strongly related as a direct product of social status. Information does not directly increase participation, but does act strongly and consistently through sense of governmental impact, political efficacy, and, especially, attentiveness to politics. Basic information is the most consistently patterned of all the attitudes. It seems to be a fundamental prerequisite to the interest and awareness which stimulate participation. (We must recall at all times, however, the strong component of organizational involvement which did *not* operate through any of the attitudes, including information.)

In each nation about 1/3 of the correlation between status and participation was explained by paths passing through information. This has interesting implications for political stability and coalition consistency in developed nations, given the research showing strong relationships between information levels and consistency of vote, inter-relatedness of belief systems, and the like. The growth of a middle class, as political scientists since Aristotle have observed, provides an anchor of political stability. One linkage may be the development of basic information levels among citizens likely to participate consistently.

Perceived stake in society.—There is a long tradition of speculation about participation which suggests that the "better elements" in the society participate more frequently because they have more of a stake in the outcomes of political decisions. Related to this speculation is the observation that higher status and more organizationally involved citizens are closer to the "cen-

[15] See Almond and Verba, *op. cit.*, pp. 161–179; and Angus Campbell, Philip E. Converse, Warren E. Miller, and Donald E. Stokes, *The American Voter* (New York: John Wiley and Sons, 1960), pp. 105–106. For a general review, see Richard Dawson and Kenneth Prewitt, *Political Socialization* (Boston: Little, Brown and Co., 1969), especially chapters 9 and 10.

[16] Alker, *op. cit.*; Karl W. Deutsch, "Social Mobilization and Political Development," this REVIEW, 55 (September, 1961), 493–514; Daniel Lerner, *The Passing of Traditional Society* (New York: Free Press of Glencoe, 1958); and see the essays in Lucian W. Pye (ed.) *Communication and Political Development* (Princeton: Princeton University Press, 1963). It should be emphasized, however, that we are here dealing with very fundamental types of information, as captured by these responses naming party leaders and cabinet positions at the national levels. More detailed and sophisticated types of information might be expected to follow such factors as involvement and participation, rather than act as a basis for them.

ter" of society, and more likely to be in touch with government in their daily economic and social routines. Although we have no data to test the idea that higher status citizens actually perceive greater need to contact officials, there were questions asking citizens about the level of impact which, they felt, local and national governments had on their daily life.

Contrary to the speculations, perception of a general "stake" of this kind was not an important link between status or organizational involvement and participation. In most countries the link was negligible, and correlations spurious. Although generally related to political information, the sense of governmental impact (variable #5 in the model), had only weak links to attitudes further up or down the chain. At least as measured here, the hypothesis must be rejected.

Social competence and political efficacy.—Higher social status and organizational involvement, it has been argued, provide a citizen with a general sense of competence and importance; these feelings are transferred from the social to the political world. The socially advantaged citizen assumes that political events can be manipulated and controlled and this sense of political efficacy increases the likelihood he will participate in politics. Variable 6 is a sense of political efficacy, as measured by a number of indices, including the feeling that one understands political events, the perception that access channels exist in case of grievance, and the expectation of success if active participation is undertaken.[17]

Although we have no data on feelings of general social competence, it is clear that political efficacy does play a strong role in the relationship between social class and participation. What is striking is the importance of efficacy as an intervening variable in paths from the other intervening variables.

Efficacy does, however, show a great deal of variation from nation to nation. There are strong downward links to attentiveness in all cases, and very strong direct links to participation in two nations (Germany and Italy). We cannot explain the differences, however, which range from Italy, where half of the relationship between status and participation is explained by paths through efficacy, to Great Britain, where its role is a negligible 6%.

[17] As noted in Part I, footnote 15, efficacy is not a simple concept and other dimensions of it must be explored in other analysis. Efficacy as measured here is a sense of *personal* ability to cope with the political world. It seems to be a somewhat different concept from sense of approval or satisfaction that the political system is generally responsive.

One further point has bearing on the efficacy hypothesis. In the course of analysis we decomposed our dependent variable, political participation, and examined the causal model in terms of each of its components. All the general patterns remained the same, confirming our faith that the scale was built from a relatively consistent dimension, except that political competence was more important as a link to the more active forms of participation, such as contacting local officials, than it was in talking politics. Attentiveness, on the other hand, was far more strongly related to talking politics, although still powerful in all cases. Thus a sense of efficacy, it would seem, is a more important resource for initiating government contacts than for less active forms of political involvement. More complete findings of this path analysis by type of political activity are reported in Appendix II.

Political attentiveness.—The last variable in the attitude chain was political attentiveness, a scale built from whether citizens reported following political affairs in general and through specific mass media. A frequently heard hypothesis is that higher levels of social status and organizational involvement increase the general awareness of social happenings and their consequences. As we have seen, increased levels of information seem to provide a resource for such attentiveness. This general awareness spills over into political awareness, which provides a resource and stimulus for political participation.

Our data confirm the critical linking role of attentiveness to politics, although we do not have data to relate general social awareness to political attentiveness. The pattern suggests that status leads to acquisition of attitudes which prepare the individual for active political involvement when appropriate stimuli or needs arise. The consistency of the attentiveness variable as the final link in the chain emphasizes the way in which these attitude distributions indicate generally attentive "publics" which are likely to play a consistent political role.[18] Attentiveness paths always account for at least one-fourth of the relationship between status and participation, and range to a high of two-thirds in Italy.

The most consistently important single paths through the attitude variables are from status and involvement to citizen duty and, particularly, information, which then act on efficacy and attentiveness, which in turn affect probability of participation.

[18] See V. O. Key, *Public Opinion and American Democracy* (New York: Alfred A. Knopf, 1961); and also Gabriel A. Almond, *The American People and Foreign Policy* (New Haven: Yale University Press, 1954).

The variation in the roles of these intervening variables should not obscure one overwhelming fact: they explain much of the influence of social status; they have far less explanatory power in linking organizational involvement and participation. We must go beyond this causal model in developing our understanding of these very important differences. A more general perspective on the amount of political participation being explained can perhaps be gained from Table 3. The increasing percentages given in the table are the squares of the coefficient of correlation or multiple correlation with participation for the various independent variables, or independent *plus* intervening variables. Social status alone, obviously, only explained about 9 percent of the total variance in participation. It is this causal relationship which has been most adequately explained in our analysis. The addition of group involvement explains an additional 18 percent of the variance in participation, a fact which is both a tribute to the strength of the variable and a challenge to further investigation, since about two-thirds of that relationship has not been explicated by our model. Addition of all attitude variables explains another 16 percent —the total model explaining about 43 percent of the variance in participation. It is, of course, unclear to what degree the total explanation could be increased through addition of further variables, and to what degree a ceiling is provided by problems in empirical survey research. In any case, the ability to explain close to half of the variance in a comprehensive scale of political participation and to relate the variables in a fashion which lends itself to great consistency in cross-national investigation gives considerable confidence in the basic analysis.

III. URBANIZATION AND LOCAL PARTICIPATION: THE CAUSAL LINKAGE PATTERNS

In Part I. of the analysis we showed that within each nation an individual's place of residence bore little relationship to his rate of political participation. For this reason we have disregarded size of place of residence as a variable in conducting our analysis of the attitudinal linkages between the social structural variables and political participation. As a double check on the findings about urbanization reported in Part I, we recomputed the causal model introduced in this part of the analysis, adding urban place of residence as Variable 1. The results were the same; the direct and indirect linkages were not altered by adding urbanization. We confirm the initial finding that knowing the size of the community in which a citizen lives adds nothing to

TABLE 3. AMOUNT OF PARTICIPATION EXPLAINED AS ADDITIONAL VARIABLES ARE ENTERED INTO THE CAUSAL MODEL

Independent Variables Added	Nation					Average Percent Explained	Average Percent Added
	US	UK	GER	IT	MX		
SES (r^2)	18%	3%	9%	8%	6%	9%	+ 9%
SES+Org.I (R^2)	32	24	26	26	28	27	+18
SES+Org.I.+Duty+Inf +Impact+Eff+Attent (R^2)	44	44	43	47	38	43	+16

Key: SES = Socio-economic Status
Org.I. = Organizational Involvement
Duty = Citizen Duty to Participate
Inf = Political Information
Impact = Perceived Impact of Government
Eff = Political Efficacy
Attent = Political Attentiveness
US = United States
UK = United Kingdom
GER = Germany
IT = Italy
MX = Mexico

our understanding of his general level of political participation.

Readers of Part I will recall that we carried the analysis of urbanization and participation one step further. We demonstrated that whereas the participation scale was unaffected by size of place of residence in our five nations, participation in local politics was somewhat influenced. Living in larger cities decreases the probability that the citizen will participate in local affairs. This finding has been tested again, but this time using the causal model. Where possible, the attitude measures were converted into indices having a local referent: sense of duty to participate in local affairs, perception of the impact of local government, sense of efficacy in local politics. The causal model, adding as independent variables the size of community in which the citizen lives and his length of residence there, was then recomputed. (See Appendix III for the path coefficients for the ten-variable recursive model of local participation.) Size of community is consistently *negatively* related to the attitude items and to actual local participation. Although the degree of negative influence is not great, accounting for about 2 percent of the variance in participation in local affairs; it is clear that moving to a larger community *reduces* the average citizen's sense of involvement, his feelings of efficacy, and his actual participation in local affairs.[19]

IV. SOCIAL STRUCTURE AND THE PARTICIPATION OF CLASS GROUPS[20]

Individuals vary in their political participation according to their social status and according to their organizational involvement, with the latter social characteristic having the stronger impact on political participation. This finding is consistent from one nation to another. Further, and because there is cross-national consistency, both social status and organizational involvement remain strongly related to political participation when we shift from the individual to the nation as a unit of analysis. That is, nations vary in their level of mass political participation according to the proportion of citizens in the middle and upper classes and according to the density and complexity of organizational life.

In addition, organizational involvement may represent an alternative channel for political participation for socially disadvantaged groups. The rural peasant, the industrial laborer, the disadvantaged black may become politically active through his organizational involvement even though he may otherwise lack the status resources for political participation. In these ways the class structure and the organizational structure of societies determine both the overall rate of participation and the relative amount of participation coming from various social groups.

We have argued that economic development changes both the class and organizational structures of a society. This is true, but other factors may also promote such changes. The class structure is, of course, intimately tied to the long-term development of human and capital resources. Governments may establish massive education programs and engage in forceful income redistribution. These efforts may well affect participation patterns. However, obviously major changes in the status structure, involving occupation, education, and income patterns, are extremely difficult to bring about. We suspect that the organizational structure may be susceptible to more direct and short-term manipulation. Assuming that our organizational correlations reflect causal patterns, rather than the operation of self-selection mechanisms (an assumption we feel is tenable), then the great influence of organizational structure on participation suggests important possibilities for political change.

Although there are few systematic and comparative studies of the process of organizational development, there are numerous examples of efforts by governmental and extra-governmental bodies to generate organizational structure. Religious groups, for example, have spawned an enormous variety of organizations. Governments have fostered—and impeded—the development of both political and non-political organizations such as farmers' associations, professional societies, trade unions, and youth groups. The European socialist movements and the accelerating actions of civil rights groups in the United States in the past few years are additional examples of group mobilization only partially related to economic development patterns. We

[19] Carrying out the equivalent operation for participation in national politics yields even less distinctive patterns. Direct linkages between place of residence and contacting national officials are virtually zero in each nation; the basic interactive patterns analyzed in the general model are still the overwhelming ones; only sense of national efficacy shows a significant—and still very slight—positive relationship to living in larger cities (and only in three nations of our five). The effect of urban residence on patterns of contacting national officials, in other words, is possibly measurable, but very, very weak. No more than one percent of the variance in the national participation item is affected by urban residence in any of the five nations.

[20] We are indebted to Mr. Jae-On Kim for help with some of the methodology required for our analysis in this section.

should not underestimate the complexity of the problems. The new African states have discovered the difficulties in penetrating a pre-mobilized economic structure even with a mass political party, as the numerous coups in recent years illustrate. And the history of socialist and labor movements suggest the frequency of middle class leadership in initial generation of working class movements. Nonetheless, the historical examples suggest a potential manipulability of the organizational structure, as well as a potential for mediating the effects of social class, which make it a central variable in the analysis of participant societies.[21]

The shape of the class structure, the extent of organizational involvement, and the relationship between social status and organizational membership are only partially determined by economic development levels. And these three factors have a complicated but identifiable impact on the overall rate of participation as well as on the amount of participation coming from the various social classes. In this section we explore how different mixtures of these factors affect the degree to which class groups will be under- or over-represented in the "stratum" of political participants in a society. An example illustrates what is meant by these terms as we employ them. Suppose that one-fourth of the citizens are active participants (by some explicated criterion) in the political life of their society. Suppose further that lower class peasants and industrial workers numbered half of the total society. Also suppose that a very limited proportion of this group were members of organizations. All of our previous analysis would therefore suggest that while this class group represented 50 per cent of the total society, it would probably represent a *much* smaller proportion of the 25 per cent who are active political participants. We would conclude that the peasants and workers were "under-represented" in the political stratum.

On the basis of the findings reported above and in Part I of this study, we can make some reasonable estimates about the effect on the level of mass political participation when changes occur in the society's class or organizational structure. We can also project or "simulate" the extent to which various class groups contribute more than or less than their share to the participant stratum. The basis of this analysis is the estimation of the participation level of the organizational members and non-members among the different class groups. This estimation is based on the matrix of correlations among the three variables of status, organizational membership, and political participation. For instance, of the citizens who are lower status but organizationally active, what proportion are likely to be politically active? Of the citizens who are middle class and not organizationally involved, what proportion will likely be political participants? And so forth. The changing size of these groups of citizens along with the strength of the association among the factors yield a projection of the changing participation patterns.

Once the correlation among the variables is known, the projections can be made by translating the correlation coefficients into percentage differences. This is by no means an exact process, but rather one of gross estimation —however, there are some guidelines in the statistical literature.[22] For our five nations the average correlation between social class and political participation is .30 and between organizational involvement and participation, about .50. The following estimates are indicated:

(a) With a correlation of .30 between social status and political participation, the higher social status groups in the society will have 15 to 25 per cent more political participants than the lower groups. (Assuming social status to be trichotomized and participation to be dichotomized.)

(b) With a correlation of .50 between organizational involvement and political participation, the organizationally involved citizens will have 30 to 40 per cent more political participants than the non-involved citizens. (Assuming organizational involvement and participation both to be dichotomized.)

[21] It may also be true that the development of different types of national industries may create differential needs for economic organizations depending upon industry requirements to coordinate production, transportation, marketing and the like. See, for example, Barrington Moore, Jr.'s discussion of the differential impact that varying types of national industry have on the social structure, in *Social Origins of Dictatorship and Democracy* (Boston: Beacon Press, 1966).

[22] See for interpretation of percentage differences, Robert H. Somers, "A New Asymmetric Measure of Ordinal Variables," *American Sociological Review*, 27 (1962), 799–811. Also for interpretation of percentages for 2×2 tables as "proportional reduction of error" comparable in meaning to the square of the product moment r, see Jae-On Kim, "Predictive Measures of Ordinal Association;" unpublished manuscript. We are also indebted to Mr. Kim for helping us work out these percentage differences in our data.

Given these percentage differences, a return to the actual data provides us with a realistic base line—approximately 15% of those defined as lower class who are not members of any organization can be classified as politically active. This base line approximates the proportion who report discussing politics at least once a week or some more active type of participation. (See other items in the participation scale in the Appendix to Part I.) Using this base figure and the percentages differences defined above, we can estimate the rates of political participation for the various mixtures of social class and organizational involvement.[23]

Upper Class,
Organization Members = 70% Participants
Non-Members = 35% Participants
Middle Class,
Organization Members = 60% Participants
Non-Members = 25% Participants
Lower Class,
Organization Members = 50% Participants
Non-Members = 15% Participants

These estimates permit us to make two types of projections. First, we can estimate the overall increase in mass political participation when the class structure of society is altered or when the organizational life of society is altered. Table 4 presents illustrative analysis. Nation #1 has a class structure corresponding to that of a relatively underdeveloped country: 70 per cent of its citizens are lower class, 20 per cent are middle class, and 10 per cent are upper class. Futher, this nation has little in the way of organizational infrastructure. Only 15 per cent of the citizens belong to organizations. Nation #2 resembles the previous nation in its class structure, but it has a much richer group life—60 per cent of its citizens belong to organizations. Nation #3 is a "middle class" country; its class structure, shaped like a diamond, resembles that of a relatively industrialized society. Twenty-five per cent of its citizens are lower class, 50 per cent are middle class, and the remaining quarter are upper class. This nation, however, deviates from most "middle class" societies in that its group life is underdeveloped; only 15 per cent of its citizens belong to groups. Finally, Nation #4 has both a diamond-shaped class structure and a well-developed organizational life. The last column in Table 4 presents a projection of the proportion of citizens who are politically active in each of the nations.

According to the simulation, the middle-class and organizationally developed society (#4) has nearly twice as many citizens actively involved in political life as does the society with a class structure resembling that found in many non-industrialized nations and where there is little organizational infrastructure (#1). Thus we see, as shown in our five nations in Part I, that the number of citizens actively involved in political life varies according to the shape of the stratification system in the society and the complexity of its organizational infrastructure, with the latter characteristic showing the stronger relationship. (Nation #2 has more participants than Nation #3.)

Estimating participation levels of different groupings in society permits us to make a second set of projections as well. Altering the shape of society's class structure and its distribution of organizational members does more than change the absolute level of political participation. It also changes the *relative contribution* of various class groups to the political participant stratum. We have noted that (1) because social status and political participation are positively correlated, the lower classes are always under-represented among the political participants; and (2) that for the lower status citizen, his involvement in organizations can somewhat compensate for his lack of other resources and can provide a channel for political access. Moreover, because the impact of organizational involvement may overweigh that of social status in societies with

TABLE 4. ESTIMATING THE PARTICIPATION LEVEL OF SOCIETIES DIFFERING IN THEIR CLASS STRUCTURE AND DENSITY OF THEIR GROUP LIFE*

Nation	Given Social Conditions		Projected Participation
	Class Structure of Society: Proportion in Low, Middle, Upper Classes	Organizational Density: Proportion of Citizens Belonging to Organizations	Proportion of Citizens Who Are Politically Active
#1	70—20—10%	15%	25%
#2	70—20—10	60	40
#3	25—50—25	15	30
#4	25—50—25	60	46

* Correlation between class and participation is assumed to be .30. Correlation between organizational membership and participation is assumed to be .50. For explication of the projections in this table, see Appendix iv., below.

[23] Note how closely these projective estimates come to the actual data presented in Table 4 Part I of this article.

an extensive and complex group life, the relative disadvantage of the lower class citizens is less, providing that the distribution of organizations is equal among the social strata.

If we assume that different class groups have different political goals and interests, then the persistent under-representation of lower class groups is a politically significant fact. However, caution must prevail in drawing inferences, since there is no way to move directly from the degree of under-representation of a class group in the participation patterns to a statement about the distribution of social values. For instance, there may be limited unity on certain issues among citizens sharing a similar class position, or limited perception of shared class interests. Further, "active participant" as we use the term is an arbitrary category; there may be checks through electoral participation and the anticipations by leaders of electoral sanctions even when direct contacts are not made with the political leaders.[24]

Nonetheless, the systematic under-representation of the lower class groups is a base-line fact in all the participation relationships examined. It is, therefore, of some importance to find that the effect of organizational membership *could* alter patterns of disproportionate contribution by class groups to the participant stratum. Table 5 presents the data originally presented in Table 4 plus additional relevant materials. Again, it is based on simulating the different variables in order to show their effect on the relative representation of social class groups among the political participants. In Table 5, column I shows nations with two different class structures as previously discussed. Column II shows nations with two different organizational structures, either 15 per cent or 60 per cent of the citizens belonging to groups. Column III gives the stipulated relationship between social status and organizational membership. In the examples chosen we show nations in which there is no relationship between status and membership, (organizational memberships are distributed evenly throughout the status groups), and nations with a strong (.5) relationship between status and organizational membership, (upper class persons are much more likely than lower class persons to be organizationally involved). In column IV we show the computed class structure of the active participants in society; this is computed from the size of the status-organizational membership groups and the participation of each group as discussed previously. (See Appendix iv for methodological details.) The proportion of lower, middle, and upper class citizens among the active participants can be compared with their proportions in the total population shown in the first column. Finally, in column V, we show the difference between the lower class's proportion of political participants and its size as a group in the society, divided by its total size. This is an index of the under-representation of the lower class in nations differing in their class structure, organizational life, and strength of relationship between social status and organizational membership. All the index scores are negative since the positive correlation between status and political participation means that the lower class is always to some degree underrepresented.

The simulation presented in Table 5 underlines several themes already introduced during the discussion of the manner in which social status and organizational involvement provide alternative routes into the politically active stratum of society. We can conclude that:

(1) The higher the total organization level, the less the lower class is under-represented. Increasing organization level from 15 to 60 per cent reduces lower class under-representation scores by about one-third. (Compare lines 1 and 3, 2 and 4, 5 and 7, 6 and 8.)

(2) The higher the correlation between status and organizational membership, the more under-represented the lower class. A correlation of .5 increases under-representation in these cases by at least one-half. (Compare 1 and 2, 3 and 4, 5 and 6, 7 and 8.)

(3) The smaller the size of the lower class, the more it is, relatively, under-represented. The consistent magnitude of the distortions in participation rates weighs more heavily against a basically smaller group. Thus, other factors equal, the diamond-shaped system has a smaller lower class, but one whose participatory representation suffers relatively more from the relationship between status and participation. The effect in these cases doubles under-representation. (Compare 1 and 5, 2 and 6, 3 and 7, 4 and 8.)

[24] The need for caution in moving from analysis of social stratification, and even gross patterns of political participation, to assumptions about political decision-making patterns and outcomes has been amply demonstrated in the various studies of community power. See especially Robert Dahl, *Who Governs?* (New Haven: Yale University Press, 1961); and Nelson W. Polsby, *Community Power and Political Theory*, (New Haven: Yale University Press, 1963). Factors shaping participation patterns must be incorporated as *one* element in such analysis.

TABLE 5. SOCIAL STRUCTURE AND CLASS GROUP PARTICIPATION: A SIMULATION

Simulation No.	Given Conditions			Projected Participation Patterns	
	I	II	III	IV	V
	Class Structure of Society: Proportion in Low, Middle, Upper Classes	Organizational Density: Proportion of Citizens Belonging to Organizations	Class-Organization Correlation	Class Structure of Politically Active: Proportion in Low, Middle, Upper Classes	Index of Underrepresentation for Lower Classes[a]
1	70% −20% −10%	15%	.0	59% −25% −16%	−16
2	70 −20 −10	15	.5	51 −28 −22	−27
3	70 −20 −10	60	.0	63 −23 −14	−10
4	70 −20 −10	60	.5	59 −25 −16	−16
5	25 −50 −25	15	.0	17 −50 −33	−32
6	25 −50 −25	15	.5	13 −50 −37	−48
7	25 −50 −25	60	.0	20 −50 −30	−20
8	25 −50 −25	60	.5	16 −50 −34	−36

[a] Computed by (1) subtracting the per cent of active participants in the lower class from the total per cent in the lower class, and (2) dividing the difference by the latter. For full explanation of the projections in this table, see Appendix IV, below.

The utility of the simulation analysis and the implications of the patterns reported in Table 5 will be clearer if we shift attention to the actual data from the five nations. That is, we can carry out the same analysis and show the degree of under-representation by the lower classes in each of the five nations we have used in this study. We will use cutting points which, with one exception, are identical from nation to nation to show the empirical data equivalent to that simulated above.[25] Table 6 presents the data.

The most striking pattern in Table 6 is the extent to which the lower class is under-represented among the politically active citizens in the United States; the lower class is more severely under-represented there than is true in any of the other nations. The simulations in Table 5 suggest the reasons for this (Note that the U.S. case corresponds roughly to simulation 8; Mexico to simulation 1.) The severe under-representation in the United States results first from the relatively *small size* of the lower class, which is confronted with a basic correlation between class participation which is higher than average. (Although it is not a powerful part of the phenomenon, the partial correlation between status and participation, controlling for organizational membership, remains higher in the U.S. than in the other nations. We have no explanation for this fact.) Secondly, while the high level of organization in the United States might have canceled out the effect of the relatively small class size (compare simulations 1, 5, 7), the high correlation between social class and organizational involvement (.44) eliminates the potential help offered by the organization structure. See Column III.

It seems likely that the high correlation between social class and organizational involve-

[25] Since our scales were derived to give intra-nation distributions of maximum utility, their validity for cross-national absolute comparisons is somewhat limited. Nor is it entirely clear how one should treat an indicator like "years of education" as a social status indicator on a cross-national basis. The meaning of such absolute measures, like the real buying power of formal income equivalents, depends considerably on the distribution of the commodity within the society. Nonetheless, the chosen cutting points fitted four of the societies in fairly plausible fashion. Actual distribution of education in the United States, for example, reported in the 1959 census was about 17% college educated, 48% 9–12 years of education, and 35% with 8 years or less. (Compare the class distribution in Table 6.) Only in Britain was a slightly different scale cutting point used—the division between lower and middle class was lowered by one level to show 46% in the lower class rather than 60%. This seemed a more plausible distribution in comparable terms, although it does not greatly affect the class analysis.

TABLE 6. SOCIAL STRUCTURE AND CLASS GROUP PARTICIPATION: FIVE NATIONS

Nation	Given Conditions			Overall Participation Rate: Per Cent Classified as Politically Active[a]	Projected Participation Patterns	
	Class Structure of Society: Proportion in Low, Middle, Upper Classes	Organizational Density: Proportion of Citizen Belonging to Organizations	Class-Organization Correlation		Class Structure of Politically Active Proportion in Low, Middle, Upper Classes	Index of Underrepresentation for Lower Classes[b]

[a] Being classified as "politically active" is roughly equivalent to discussing politics at least once a week, or more active involvement, as measured by our original scale items. Appendix B, Part I, reports this scale.

[b] Computed by (1) subtracting the per cent of lower class among active participants from the total per cent in the lower class, and (2) dividing the difference by the latter. See Appendix

ment in the United States reflects the fact that in the three European countries there existed historical efforts by political parties to mobilize the lower class and, especially in Germany, to create an organizational structure deliberately parallel to that which had traditionally evolved among the established strata. Even where there may have been a considerable subsequent disengagement of the parties from organizational domination, the effects of such mobilization may have continuing consequences. Lipset and Rokkan have suggested the importance of the political organizational structures initially established during the social mobilization of the society in setting the party alternatives for the society in subsequent years.[26] Their analysis may well apply to the initial formation of organizational infra-structures more generally. In Mexico, the political regime itself has engaged in a protracted attempt to create a lower class infrastructure. For various reasons, such deliberate attempts at group formation in the United States have been more limited, and particular socio-economic features may have also inhibited the development of lower class organizations.[27]

Explanation of these historical patterns is beyond the scope of our analysis. But it is at least clear from the American case that the growth of a lower class organizational structure is *not* part of the natural process of economic development. In fact, the consistent positive correlation between organizational involvement and social class points just in the opposite direction. As Olsen and other theorists of the costs of organizational development have suggested, the consequent "natural" evolution has limited the formation of mass organizations among groups with low resources.[28]

[26] Seymour M. Lipset and Stein Rokkan, *Party Systems and Voter Alignments* (New York: Free Press, 1967), pp. 50–56.

[27] A wide range of possible reasons for this failure of group mobilization of the American lower classes has been suggested. These include the presence of the frontier, the general belief in social mobility and economic progress, the tremendous linguistic, ethnic, and religious differences during the period of immigrations, and the lack of traditional social structures such as guilds. Others have suggested more specifically political factors. For example, Walter Dean Burnham, "The Changing Shape of the American Political Universe," this REVIEW, 59 (March, 1965), p. 24. A unified interpretation is obviously beyond the scope of the present discussion.

[28] Mancur Olson, *The Logic of Collective Action* (Cambridge: Harvard University Press, 1965). The organizational membership cutting points are the same from nation to nation; they correspond closely to the percentage of citizens in each nation reporting membership in one or more organizations (U.S. 57%; U.K. 47%; Germany 44%; Italy 30%; Mexico 24%), although our scale is composed of several items, rather than membership alone.

The evidence presented here, both actual data and the simulation, suggest a basis for analysis of trends in political participation and group representation. If, for instance, it proves to be the case, as recent data suggest, that the American lower class black population is developing a secondary group structure more rapidly than other similarly located groups in society, one should expect an emergent pattern of broader based representation in the political stratum—a movement from simulation 8 to simulation 7 in Table 5.[29] A more complete understanding of these processes, *and* of the reliability of the relationships under differing conditions, might enable us to foresee some of the outcomes of patterns of social change in various national settings.

However, although alerting us to conditions which affect the rates of political participation and the relative contribution of different social groups to the participant stratum, the simulation as presented ignores the issue of the "quality of participation." We saw in the previous section that persons mobilized into a politically active role through their organizational involvement need not share the attitudes normally thought conducive to "rational" political involvement. In the conclusion we attempt to sort out some of the issues connected with the costs and benefits of more equitably distributed access to the participant stratum.

V. SUMMARY AND CONCLUSIONS

Evidence from five nations indicates that the relationship between economic growth and increases in mass political participation is largely explained through two changes in the social structure of society: larger numbers of upper and middle class persons, in both relative and absolute terms; and the emergence of organized economic and social groups. Stating the relationship between economic development and mass political participation in terms of structural changes in society provides strong empirical correlations and leads to inclusive social theory. The frequently cited correlations between such individual traits as years of education or number of organizational memberships and the citizen's specific acts of political involvement can be subsumed into the more general theory advanced in this study.

At the national level economic development is associated with urbanization, with the growth of secondary groups, and with the expansion of the white-collar class. Each of these variables has been cited as producing mass political participation. We find, however, that at the individual level urban residence has little effect on participation. Living in larger cities has some *negative* impact on *local* participation, but the total amount of variance explained is slight. An even weaker relationship between urban residence and national participation seems purely a function of the concentration of status resources in urban areas in these systems.

There is less of a correlation between social status and organizational involvement than is sometimes supposed. In their impact on political participation, these characteristics clearly can operate independently of one another. In addition, social status and organizational involvement are differentially linked to participation by intervening political attitudes.

Social status tends to affect political participation through its impact on political attitudes and cognitions which, in turn, facilitate political activity. Although the findings are tentative, the data do suggest that the most important causal link is the creation of *attitudinal resources* that sensitize an individual to political messages and provide him the sense of competence needed to engage in political behavior. There is also evidence indicating that higher status exposes the citizen to learning situations in which the duty to participate is stressed. Acquiring this normative predisposition leads the citizen to acquire other attitudinal resources, such as information and competence, which further increase his probability of political participation. (There is, however, wide variance from nation to nation in the importance of an attitude of civic duty and we present these remarks very tentatively.) Finally, the data tend to reject the hypothesis that the well-to-do citizens participate more frequently in politics because they perceive a higher stake in the day-to-day conduct of political affairs. Correlations between such views and participation appear to be spurious.

Involvement in organizations can also produce the attitudinal resources which facilitate political participation. In some cases, at least, organizational involvement is a source of the sense of a normative obligation to participate (in Germany, a stronger source than status). However, in the main the extremely strong relationship between organizational involvement and political participation does not operate through the acquisition of attitudes and cognitions which facilitate participation.

The causal links connecting social status with political participation, links which create attitudinal resources enabling the individual to participate when opportunities occur, are a minor part of the causal impact of organizational involve-

[29] Anthony M. Orum, "A Reappraisal of Social and Political Participation of Negroes," *American Journal of Sociology*, 72 (July, 1966), 32–46.

ment. There is either some sort of self-selection effect which ushers the same citizens into both political activity and organized group life, or there is a strong role played by organizations in mobilizing group members for political activity. The latter interpretation is the more likely, although the two are not mutually exclusive. But such mobilization, if it occurs, does not necessarily result in or reflect higher levels of general political information or awareness. Apparently mobilization opens direct lines to participation, or provides attitudinal resources relevant to specific problems only. There might be, for instance, group-initiated political discussion, group-organized contacts with political authorities, or group-related political information relevant to a specific issue.

Implications—The findings reported in this research paper have implications more far-reaching than those thus far discussed. The findings are, of course, closely related to an understanding of some of the stresses and strains in mass democracies. A research report of this type is not the most useful vehicle for speculating about issues of democratic theory, but insofar as our data suggest some observations, we would be remiss to ignore them completely. Let us at least consider what the patterns may imply about one particularly critical problem: the paradox of mass involvement in political life.

First, the data confirm one well-known finding: Even in industrialized nations a majority of citizens do not participate very actively in politics and do not have the attitudinal resources which lead to citizen control of public policies.

The data support social theories which suggest that industrialization is a necessary condition for the establishment of mass involvement in democratic politics.[30] A key component in this theory is the observation that the tendency to get involved in politics, and the attitudes associated with involvement are not randomly distributed in society. Rather, these tendencies and attitudes tend to cluster in the middle and upper classes. Political life styles of citizens will not be markedly changed until extensive industrialization alters the status structure of society, and thereby increases the overall level of political information, attentiveness, efficacy, and so forth.

Second, the data suggest the critical role which the structure of organized group life may play in the overall level of mass political participation. It appears that the richness and complexity of organizational life might be altered somewhat independently of economic development. Deliberate governmental policies, for instance, can increase the number of citizens who are politically active. Mobilization parties in the single-party states of Africa are one example of how this might happen. Unionizing the labor force, even if comprised of peasant farmers, is another illustration. That is, although historically the growth of secondary groups has been associated with economic development, mobilization politics need not await industrialization. New stimuli to group organization may provoke new patterns of growth, although we observe that complexities and difficulties (beyond this analysis) have met such efforts in practice.

Organizational membership, then, could be a political resource for the lower classes. Were this resource equitably distributed, the criteria for pluralistic democracy advanced by Dahl, Key and others would be more nearly met.[31] That is, all social strata in the society would participate in those political processes which presumably lead to control of political leadership and through this control to influence over public policy. Group mobilization could attract into political life larger numbers of those persons who presently are political isolates. These citizens need not have the enabling antecedents, such as higher levels of education, now thought to be necessary conditions for political participation. Alterations in the organizational structure, then, can serve to correct the tendency for even the most democratically organized societies to allow a disproportionate amount of political influence to be exercised by the well-to-do.

These observations about the organization-related potential for increasing political participation should be advanced cautiously, however.

[30] For example, Seymour Martin Lipset, *Political Man* (Garden City: Doubleday and Co., 1960), pp. 27–63. Also see Philip Cutwright, "National Political Development," in Nelson W. Polsby, Robert A. Dentler, and Paul L. Smith, (eds.), *Politics and Social Life* (Boston: Houghton Mifflin Co., 1963), pp. 569–582. In his critical analysis of Lipset and Cutwright, Deane Neubauer argues that economic development may be a necessary condition for democracy, at least to some threshold, but that the relationship is not linear, and does not seem to hold within the subset of more developed systems he examines. See Deane Neubauer, "Some Conditions of Democracy," this REVIEW, 61 (December, 1967), pp. 1002–1009.

[31] Robert A. Dahl, *A Preface to Democratic Theory* (Chicago: University of Chicago Press, 1956); Key, *op. cit.*; and see the exchange between Jack Walker, "A Critique of the Elitist Theory of Democracy," and Robert A. Dahl, "Further Reflections on the 'Elitist Theory of Democracy,'" this REVIEW, 60 (June, 1966), 285–305, and Communications to the Editor.

For one thing, we reemphasize that in every nation examined social status and organizational involvement were somewhat correlated, though the relationship is not determinate. Indeed, it is important for the student of American politics to note that the distribution of organizational resources is more intertwined with the distribution of status resources in the United States than in any of the other four nations in the study. The natural growth of organizations, as Mancur Olson has suggested, seems to be one which places at a disadvantage very large potential groups when the individuals who might make up those groups have limited individual resources.[32] The cost to each individual of organization building is discouragingly great. It is probably no coincidence that those nations in which both political parties and governmental bureaucracies have been most active in encouraging secondary group formation show less upper class domination of the organized life of the society. What must be concluded is that processes of economic development will not automatically help redress class participation imbalances through the growth of secondary groups.

Another note of caution must be voiced as well. One cannot be certain, particularly on the basis of data presented here, about the quality of organization-based political participation. The individual mobilized by his group membership lacks the attitudes usually associated with political involvement. This may mean that the content of his effort to influence will be largely determined by the mobilizing leaders, a possibility suggesting that organizations are more the base of a "counter-elite" than a source of broader and more democratic patterns of political influence.

Whereas our findings suggest a potential for participatory democracy which is in optimistic contrast to most modern empirical studies of mass participation, these same findings raise again the specter of mass "irrationality" and "ignorant" involvement which has haunted democratic theorists since the Greeks. Organizations mobilizing their members and providing resources for their leaders present the possibility of large numbers of political activists who do not have the attitudes usually assumed to be associated with involvement in political life. Political information, a sense of civic duty, political attentiveness, and a sense of political efficacy are not preconditions for political participation among the organizationally involved.

Just what this implies is not entirely clear from the data at hand. While some modern American theorists have placed great stock in the moderating influence of norms of tolerance and accommodation, and of the gate-keeper role of those thoroughly socialized into recognition of democratic procedures and processes,[33] it is not evident that such norms are necessarily the property of elites rather than masses. If American data showing the informed substratum to be more tolerant and democratically oriented, although also more split on political issues, are correct, then group mobilization in this system is likely to be associated with higher levels of conflict and intolerance.[34] On the other hand, there is some evidence that in systems with a more ideological and conflict-ridden history, the better informed and more active citizens may possess belief systems into which deeply rooted hostility and suspicion of the opposition, as well as intransigent issue positions, are firmly integrated.[35] Such would seem to be the case in nations such as France, Austria, and Italy. In these circumstances, group mobilization of a certain type might draw into the system citizens oriented more pragmatically to specific issues and problems, who might press elites to abandon traditional attitudes of rigidity.

The problem is further complicated by the facts that (1) the relationship between basic attitudes, such as information and attentiveness, and the specific affective and normative content of opinions, has not been established; and (2) the possibility that under some conditions group activity itself may structure affective attitudes must be brought into the analysis. In nations where organized groups are linked to partisan camps, and few groups cut across party, class, and religious lines, then involvement itself may reinforce suspicions and hostilities. Thus, in nations such as Italy and Austria, where group members and leaders seem to be more distrust-

APPENDIX IV. PROCEDURES USED IN COMPUTING THE TABLES (4, 5, 6) IN THE ANALYSIS OF SOCIAL STRUCTURE AND THE PARTICIPATION OF CLASS GROUPS

In our discussion of the representation of various class groups among the political participants in a society, we present three tables of simulated and empirical data. The following description of the computation of these tables should be compared to the analytic discussion in the text.

Table 4 and 5: Simulated Data. The following step-by-step analysis applies to the Columns in Table 5. For Table 4, use steps 1, 2, 4, 5, and 6 only.

(1) Columns I–III are the conditions stipulated for the society whose participation pattern is to be simulated.

(2) From these three conditions it is necessary to compute the size of the six class-organization groups in the society (i.e. proportion of low class-uninvolved, low class-involved, middle class-uninvolved, middle class-involved, upper class-uninvolved, upper class-involved.)

(3) If the correlation between status and organizational membership is .0, then the organizational memberships—whose absolute number in the society is given in Column II—are distributed evenly through the class groups. The size of the group is multiplied by .15, .60, or whatever the proportion of memberships in the system, and this gives the size of the involved members' proportion in each class group. The uninvolved are the difference between the involved proportion and the original size of the group.

(4) If the correlation is .50, then our estimates (See footnote 14) suggest that the difference between the number of organization members in the upper class and the number in the lower class should be about 35%. The following equation can be solved for the percentage of organization members in each class group, given this range of difference and the stipulated level of organizational membership in the society:

$Ax+By+Cz=100\ M$

$z=x+35$, $y=x+17$; as simultaneous equations

where:

A is the proportion of lower class persons in the society

B is the proportion of middle class persons in the society

C is the proportion of upper class persons in the society

M is the proportion of organization members given

x is the proportion of organization members in the lower class; y is the proportion of organization members in the middle class; z is the proportion of organization members in the upper class.

A, B, C, and M are stipulated by the conditions. Other simulations for alternative correlations between status and organization could, of course, be carried out using estimates of the type noted in footnote 22—which determine the relationships between x, y, and z in the above equations.

(5) The proportion of each sub-group in the society is multiplied by the participation rates for that sub-group, shown in the text and originally estimated from the average cross-national correlation coefficients.

(6) The number of participants in each sub-group is summed to get the participation rate for the society. (See Table 4.)

(7) The numbers in the sub-group are compared to the total participation rate to show the proportion of participants made up of lower, middle, and upper class individuals. (See Column IV in Table 5).

(8) The difference between lower class proportion in the society and lower class proportion of political participants (from columns I and IV) is divided by the size of the class group (from Column I) to get the index of under or overrepresentation of the group. (See Column V in Table 5.)

Table 6: Empirical Data from Five Nations.

For Table 6 we use, of course, empirical data from the surveys in the five nations to determine the size and participation within the class-organization groups. As noted in footnotes in the text, similar cutting points on the various scales were used for all five nations, with one exception. The group sizes and participation rates for the United States are shown below as an example.

Size of Class-Organization Groups in United States		*Participation in Each Group*
Low class, uninvolved	20%	14.5%
Low class, involved	11%	43.5%
Middle Class, Uninvolved	21%	32.5%
Middle Class, involved	24%	60.0%
Upper Class, uninvolved	5%	40.8%
Upper Class, involved	20%	75.5%
Total	101%	

Using this data, the calculations can be made as above, steps 5–8, or the figures in the Table can be calculated from the data more directly.

URBANIZATION AS AN AGENT IN LATIN AMERICAN POLITICAL INSTABILITY: THE CASE OF MEXICO*

WAYNE A. CORNELIUS, JR.
Stanford University

I. INTRODUCTION

A large descriptive and conjectural literature has evolved during the past decade suggesting that rapid urbanization—conceived primarily as a massive demographic shift from country to city—constitutes an important agent of political instability in much of Latin America, favoring the growth of alienation and radicalism.[1] This effect is frequently attributed to the frustration of migrant expectations for economic improvement and social mobility in the large cities, or to the processes of personal and social disorganization allegedly inherent in the migration experience. Although field researchers have long suspected the inadequacy of such theory, derived largely from the urbanization experiences of advanced Western nations, for explaining political instability in Latin America, there have been few systematic attempts at testing the various propositions and unconfirmed generalizations advanced by the "urban instability-crisis-and-chaos" theorists. This paper attempts to explore, if not to test, some of the empirical implications of the general theoretical conceptions of the urbanizing process and its socio-political consequences as developed in recent social science literature on Latin America. Mexico is selected for analysis both by virtue of its extremely rapid rate of rural-urban migration in recent years and because of the opportunities afforded by the availability for Mexico of detailed survey data from a number of independent sources to examine systematically a wide range of theoretically relevant variables and relationships posited in the urbanization literature. While in certain areas (as indicated below) the particular nature of the Mexican political system and developmental pattern may render these findings imperfect as predictors for other parts of Latin America, the analysis presented here should serve to identify the major inadequacies of existing theory and illustrate the need for new conceptual models which can encompass both stabilizing and destabilizing concomitants of rapid urban concentration in a developing nation.

* The author is indebted to Richard R. Fagen, Robert A. Packenham, and Barry S. Rundquist, all of Stanford University, for comments on an earlier draft of this paper.

[1] Overviews of a large part of this literature are provided in Richard M. Morse, "Recent Research on Latin American Urbanization," *Latin American Research Review,* 1 (Fall, 1965), 35–74; William Mangin, "Latin American Squatter Settlements: A Problem and a Solution," *Latin American Research Review,* 2 (Summer, 1967), 65–98; and Wayne A. Cornelius, Jr., "The Political Sociology of Cityward Migration in Latin America: Toward Empirical Theory," in Francine F. Rabinovitz and Felicity M. Trueblood (eds.), *Latin American Urban Annual* (Vol. I; Beverly Hills, Calif.: Sage Publications, forthcoming). Most discussions of Latin American urban affairs by social scientists and historians reflect a substantial intellectual debt to "mass society" theorists such as William Kornhauser and to the early "Chicago School" of urban sociology, especially the ideas of Robert E. Park and Louis Wirth. See W. Kornhauser, *The Politics of Mass Society* (New York: Free Press, 1959); R. E. Park, "Human Migration and the Marginal Man," *American Journal of Sociology,* 3 (May, 1928), 881–893; and L. Wirth, "Urbanism as a Way of Life," in A. J. Reiss (ed.), *Louis Wirth on Cities and Social Life* (Chicago: University of Chicago Press, 1964). For detailed analyses of the Chicago School formulations see Robert E. L. Faris, *Chicago Sociology, 1920–1932* (San Francisco: Chandler, 1967); and R. N. Morse, *Urban Sociology* (New York: Praeger, 1968), pp. 15–38, 160–72.

II. THEORY

For purposes of analysis it is possible to reduce current urbanization theory to three basic themes or clusters of interrelated propositions, which may be stated and schematized as follows:

(1) *Urbanization breeds economic frustration among the migrant population,* which aspires high but fails to participate in the material rewards of urban society. This "frustration gap" between high expectations and the ability to fulfill them results both from the inadequate premigration preparation of the migrants and the inability of urban government and private enterprise to accommodate them. Migrants are deficient in both the skills to earn a living in their new environment and the education needed to learn the

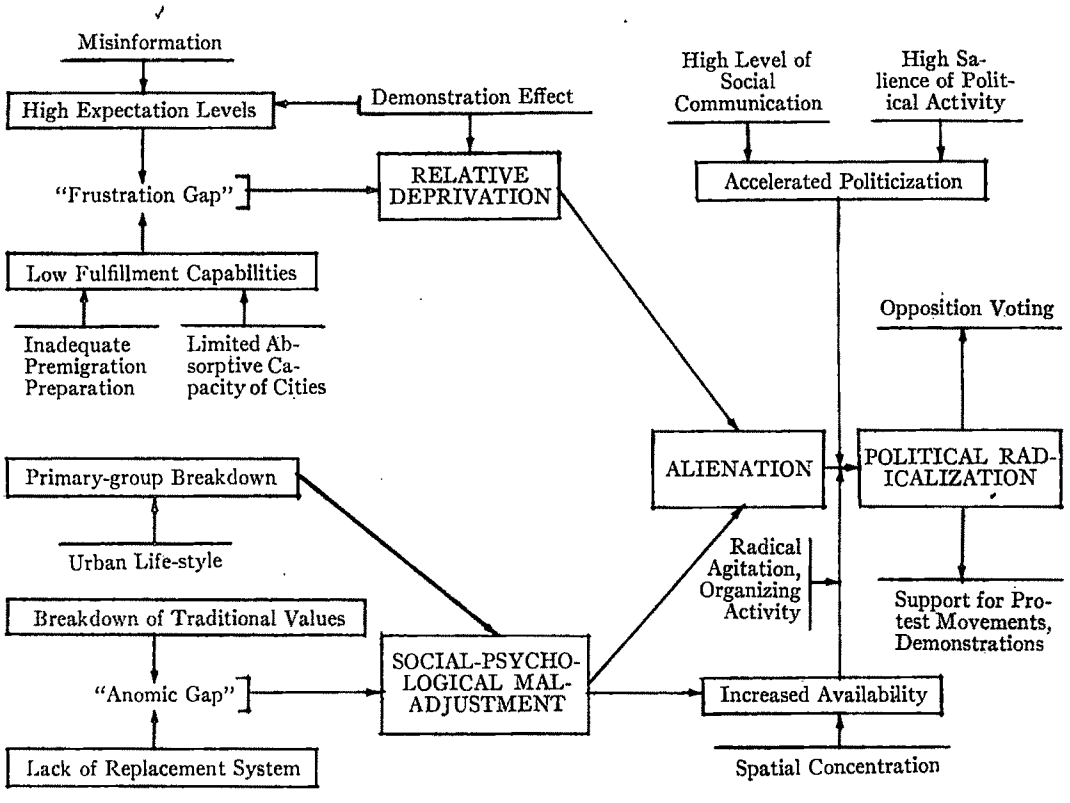

FIGURE 1. Migrant assimilation in Latin American urban environments: theory

skills; upward mobility is sharply restricted.[2] Moreover, the accelerated population input into cities makes it impossible for the public and private sectors to provide adequate housing, education, and other essential urban services. Thus for the majority of migrants, the city brings thwarted mobility expectations and objective living conditions often worse than those endured in the countryside. And the "demonstration effect" of concentrated buying power and highly conspicious forms of consumption in urban areas makes the migrants increasingly conscious of their marginal role in society. Cognitive mechanisms of relative deprivation are set into operation.[3] Frustrated material expectations and feelings of relative deprivation lead to alienation and increase the mi-

[2] Cf. Lawrence R. Alschuler, *Political Participation and Urbanization in Mexico* (Ph.D. dissertation, Northwestern University, 1967; Ann Arbor, Mich.: University Microfilms, 1968, No. 68-3156), p. 97; Leonard Cardenas, Jr., "Trends and Problems of Urbanization in the U.S.-Mexico Border Area" (unpublished paper presented at the Conference on Urbanization in the U.S.-Mexico Border Region, University of Texas at El Paso, June, 1968), p. 4; and R. H. Fitzgibbon, "Political Implications of Population Growth in Latin America," *The Sociological Review,* 11 (February, 1967), p. 41.

[3] The relative deprivation concept is relied upon frequently in research on political alienation in Latin American countries. It is argued that even though many migrants to the cities arrive with a relatively low level of expectations and perceive a relative increase in environmental satisfaction as they compare their present status with their rural past, these early feelings of relative reward give way—perhaps after ten or fifteen years of urban residence—to relative deprivation. Migrant consciousness of economic marginality in the city supposedly increases over time. Such arguments are incorporated into the conceptual framework developed in Gláucio A.D. Soares, "Desarrollo económico y radicalismo político," in Joseph A. Kahl (ed.), *La industrialización en América Latina* (Mexico City and Buenos Aires: Fondo de Cultura Económica, 1965), pp. 516-559; Soares, "The Politics of Uneven Development: The Case of Brazil," in S. M. Lipset and Stein Rokkan (ed.), *Party Systems and Voter Alignments: Cross-Na-*

grant's propensity to engage in radical political activity.[4]

(2) *Migrants experience major difficulties in adjusting socially and psychologically to the urban environment.* Such difficulties originate in culture conflicts, the disorganization of previous living habits and customs, personal "identity crises," and primary-group breakdown.[5] Large nuclear families and kinship ties tend to disintegrate in urban society with its new standards, economic demands, and mobility patterns. The traditional social controls on deviant behavior may be weakened.[6] Ruralistic norms and modes of social interaction are found to be either irrelevant or harmful under urban conditions. Orthodox religious values are undermined, accompanied by a sense of normlessness, insecurity, and felt need for social reintegration by entry into new protective groupings. There results an "anomic gap,"[7] a time lag between the abandonment of the traditional value system and the acceptance of a replacement system. During this period the migrant is particularly vulnerable to recruitment into extremist political movements which seek to satisfy his psychological need for reintegration. Personal anomia and feelings of social isolation may persist long after the migrant is assimilated economically into his urban surroundings, threatening a chronic susceptibility to manipulation by demagogic political leaders.[8]

(3) *Urbanization, increased awareness of government and politics, and mobilization of radical opposition force go hand in hand.* Exposure to the urban environment with its higher level of social communication, intense competition among diverse social and economic interests, and salience of organized political activity accelerates the politicization of migrants and creates conditions for mass involvement in direct political action. Migrant frustrations and anxieties stemming from problems of assimilation into the urban environment are translated into support for opposition political parties and aggressive protest movements against established urban governments.[9] We may expect the anti-system, protest vote in a given area or locality to increase in response to high rates of in-migration.[10] Large influxes of migrants tend

> to exacerbate the destabilizing forces already at work in major cities, inviting extreme responses from either governments or populations or both. Radical agitation among the increasingly politicized urban masses, made less patient by the visible abundance of the city and more powerful by their concentration, becomes one of the greatest long-term threats to orderly development within a non-authoritian framework.[11]

It should be emphasized that the above propositions are not deduced from an integrated, formal theory of urban migration and political behavior in Latin America which is elaborated or adhered to *in toto* by the writers cited in connection with them. They are, however, reflective of a general theoretical orientation persisting strongly in discussions of the socio-political implications of rapid urbanization in the region. This orientation places heavy stress on the personally disorienting, socially disintegrative, and politically disruptive consequences of the urbanizing process.

III. METHODOLOGY

We have little direct information on attitudinal and behavioral consequences of Latin American urbanization which would enable rigorous testing of the foregoing set of propositions on a cross-national basis. However, by secondary analysis of available data from field surveys, the national census, and national election returns, we can at least approximate this goal within the context of an individual country. In the analysis of the Mexican case which follows, I shall draw primarily upon survey data on urban political culture in Mexico originally gathered for Gabriel A. Almond and Sidney Verba's pioneering cross-national study, *The Civic Culture*.[12] The relatively small number of retrospective questions in the main survey instrument used in this study, as well as the lack of a control group of non-migrant Mexicans still residing in rural areas to which the urban sample might be compared, impose certain limitations on the use of these data for an investigation of the urbanization process. Nevertheless, they still represent the most important body of systematic data on the urban Mexican's cognition and evaluation of, and sense of participation in, politics and government.[13] For purposes of the present analysis, a migrant sample consisting of 467 adult respondents born in rural villages or localities of less than 5,000 population, and who had migrated to urban centers of 10,000 or over by the time of the survey, was isolated from the universe of 1297 Mexican cases analyzed in *The Civic Culture*.[14] (Some 68 respondents interviewed in the Kahl survey in Mexico were also found to conform to our definition of migrant

Systems, 1967), p. 18; Soares and Hamblin, *op. cit.*, p. 1062; and Soares in Kahl, *op. cit.*, pp. 553-555.

Hopper, "Research on Latin America in Sociology," in Charles Wagley (ed.), *Social Science Research on Latin America* (New York: Columbia University Press, 1964), p. 265; Paul Kelso, "A Developing Democracy," in Russel C. Ewing (ed.), *Six Faces of Mexico* (Tucson, Ariz.: University of Arizona Press, 1966), p. 164; Alan Angell, "Party Systems in Latin America, *Political Quarterly*, 37 (July-September, 1966), pp. 313, 316; and Philip L. Wagner, "Political Implications of Rapid Urbanization in Caribbean Countries" (unpublished paper presented at the 57th Annual Meeting of the American Association of Geographers, Miami Beach, Fla., 1962).

[12] Princeton, N.J.: Princeton University Press, 1963. See also the detailed interpretation of the Mexican survey results provided in Robert E. Scott, "Mexico: The Established Revolution," in Lucian W. Pye and Sidney Verba (eds.), *Political Culture and Political Development* (Princeton: Princeton University Press, 1966).

[13] Another useful source of survey data on attitudinal consequences of Mexican urban development, though lacking a specifically political focus, is Joseph A. Kahl's study, *The Measurement of Modernism: A Study of Values in Brazil and Mexico* (Austin, Texas: University of Texas Press, 1968). Occasional reference will be made in this paper to the results of a secondary analysis performed on this data, obtained through the International Data Library and Reference Service, University of California, Berkeley.

[14] The actual total of interviews was 1,008, which was upweighted to 1,297 to compensate for undersampling of Mexico City, done in order to allow for greater interior city coverage. (A complete description of the Mexican sample is provided in *The Civic Culture*, Appendix A, pp. 514–516.) My use of a place-of-birth criterion in defining the migrant population has certain obvious limitations. For example, we have no indication in a given case of the stages of the migratory process or of the respondent's stage in his life cycle when he arrived in the big city. Thus between the time of departure from the community of origin and the time of arrival in the city where interviewed, a migrant may have lived in several different communities of varying size, perhaps arriving in the interview city with a relatively high degree of anticipatory socialization into urban living pat-

status, and will hereafter be referred to as the *Measurement of Modernism* sample.[15]) The modal respondent in our *Civic Culture* sample is over 35 years of age and has resided in a city of over 100,000 population for ten or more years. Females are overrepresented in our sample by a factor of 1.2 (the ratio of percent female migrants to percent females in the 1960 Mexican census). This figure is roughly comparable to the slight degree of female predominance in lifetime migratory streams in the Mexican nation as a whole in recent decades, as well as in migration patterns of other Latin American countries. Such findings reflect the continuing attractiveness of urban opportunities for female employment in commerce, industry, and services.[16]

Before turning to an examination of the social and economic characteristics, attitudes, and behavior patterns exhibited by members of our migrant sample, it may prove useful to orient the discussion by providing a brief overview of the process of urban concentration in Mexico in recent years. Some knowledge of the nature, rate, and magnitude of the process is important to an assessment of the contextual basis for political radicalism and instability in the nation's major urban centers.

IV. DEMOGRAPHY

There is no lack of evidence to support the contention that Mexico is rapidly becoming one of the most highly urbanized nations in the Latin American region. According to recent estimates by the Inter-American Development Bank, Mexico's current rate of urban growth is among the three highest in the region.[17] Although both urban and rural populations have increased sharply in Mexico, between 1950 and 1960 the rural population expanded at a rate of 1.6% per year while the urban population grew at a rate of 6.1% per year.[18] The proportion of Mexico's population in cities of 10,000 or over rose from 12% in 1900 to 38% in 1960; and it

terns (Cf. Anthony and Elizabeth Leeds, "Brazil and the Myth of Urban Rurality: Urban Experience, Work, and Values in 'Squatments' of Rio de Janeiro and Lima" [unpublished paper presented at the Conference on Urbanization and Work in Modernizing Societies, St. Thomas, Virgin Islands, November, 1967], pp. 17-18; and Arthur J. Field (ed.), *Urbanization and Work in Modernizing Societies* [Detroit, Mich.: Glengary Press, 1967], pp. 72–73). Analysis of survey data gathered in specific Mexican metropolitan areas does indicate, however, that a majority of migrants to such cities grew up in nearby rural areas and came directly to the big city with no extended intermediate steps. It has been suggested that for Mexico the model of "staged" migration might be an adequate description of the earlier moves from rural villages to large urban centers, but that once communication links are formed by the first movers from village to metropolis, succeeding waves of migrants do not necessarily have to follow in the same steps but may make a single move directly to the large urban center (see Jorge Alberto Harth Deneke, "The Colonias Proletarias of Mexico City: Low Income Settlements at the Urban Fringe," [unpublished M.A. thesis, M.I.T., 1966], p. 92). Support for this hypothesis comes from a number of anthropological and demographic studies of cityward migration in Mexico, including Oscar Lewis, "Urbanización sin desorganización," *América Indígena* (Mexico), 17 (July, 1957), p. 238; Douglas S. Butterworth, "A Study of the Urbanization Process Among Mixtec Migrants from Tilaltongo in Mexico City," *América Indígena,* 22 (July, 1962), p. 261; and Jorge Balán, *et al.* (eds.), *Movilidad social, migración, y fecundidad en Monterrey metropolitano* (Monterrey, Mexico: Centro de Investigaciones Económicas, Universidad de Nuevo León; and Population Research Center, University of Texas, Austin, 1967), pp. 73–75. It is therefore reasonable to assume that the primary place of urban socialization for most members of our migrant sample was the city where they were interviewed. The "missing" data on prior urban experience and its consequences for the assimilation process in large cities may well be non-existent.

[15] Note that subsequent references to "migrants" interviewed in the Kahl survey pertain only to those respondents meeting our criteria for definition of migrant status and not those employed by Kahl in his original analysis of the data (see *The Measurement of Modernism, op. cit.,* p. 26).

[17] See the data reproduced in Irving L. Horowitz, "Electoral Politics, Urbanization, and Social Development in Latin America," *Urban Affairs Quarterly,* 2 (March, 1967), Table 2, p. 10.

[18] Raúl Benítez Zenteno, "La población rural y urbana en México," *Revista Mexicana de Sociología,* 24 (September, 1962), 689–703. The best general survey of recent urban growth in Mexico is provided in Luis Unikel, "El proceso de urbanización en México: Distribución y crecimiento de la población urbana," *Demografía y Economía* (Mexico), 2 (1968) 139–283. Official Mexican use of the

is estimated that by 1980, nearly 70% of the population will be classified as urban.[19] Mexico's high rate of natural population growth (about 3.8% per annum in 1967 and 1968) has, of course, been an important factor in urban expansion. Of far greater importance, however, is the movement of population from the countryside into the cities, which reached torrential proportions in the 1950-1960 period, when over 2.4 million persons participated in the exodus from rural life.[20] Many left in search of greater occupational and educational opportunities in the cities; many more because of intolerable living conditions and population pressure on depleted rural land.[21] It is not surprising to find that most inter-state migration has originated in the six centrally-located states comprising the Mexican Bajío, a semi-arid agricultural region where population pressure on the land has been most severe.[22] Some 52% of the respondents in our migrant sample drawn from the *Civic Culture* survey were born in the Bajío region.

Long-distance migration has been concentrated overwhelmingly in a few large streams running from the centrally-located states to the Mexico City (Federal District) metropolitan area and the North Pacific (Baja California) region.[23] During the 1950-1960 period the population of the Federal District grew to over five million inhabitants; and growing at an annual rate of 7.2%, its population is expected to top the seven million mark by 1970.[24] The impact of migration on the capital's expansion can be gauged from the fact that over 37% of the people in the District in 1960 had migrated from elsewhere in the nation since 1950.[25] This influx contributed substantially to the truly spectacular expansion of the *"colonia proletaria"* zones, located for the most part on the periphery of Mexico City proper and extending beyond its legal limits. During the past two decades these marginal settlements expanded at an average rate of 46% per annum, while the core districts of the city grew at an annual rate of 2%. In 1966 it was estimated that nearly two million people—over one third of the population of Mexico City—made their homes in the *colonias proletarias*.[26]

V. ECONOMIC ASSIMILATION

There is some evidence that material deprivation in Mexican urban areas is not as serious as might be expected, given the massive influx of new residents from the countryside. Between 1940 and 1960, for example, the percentage of Federal District residents without access to public sanitation increased by only 18.9%, while the District's population grew by 177.1%.[27]

figure 2,500 as the breaking point between urban and rural is considered to be highly unrealistic by most students of Mexican demography. The cutting point was adopted by Mexico from U.S. census practice without due regard for differing conditions in the smaller and less developed country. Most Mexican localities of less than 10,000 people are essentially rural communities with few commercial or other urban functions and services. Thus for purposes of this paper, the "urban" population will be conceived as including all those residents of localities of 10,000 or more population.

[26] Deneke, *op. cit.*, p. 32.

[27] James W. Wilkie, *The Mexican Revolution: Federal Expenditure and Social Change since 1910* (Berkeley: University of California Press, 1967), p. 231. There are some fragmentary data from Mexican government surveys indicating that service deprivation is relatively more acute in the capital's peripheral *colonia proletaria* zones (see Deneke, "The *Colonias Proletarias* of Mexico City," *op. cit.*, pp. 73-74), where over 70% of the adult residents are first-generation migrants. However, survey data gathered by academic researchers indicate that a majority of *colonia* dwellers do

Thus for perhaps a majority of migrants to the capital, the move from country to city resulted in an improvement in the level of services and other material amenities to which they had access. This contention is supported by the results of an analysis of a sample of the 1960 Mexican census in the Federal District, which showed that, contrary to expectation, migrant residents do not differ significantly from the urban-born population with respect to standard of living indicators taken from the census data (e.g., availability of running water in households, sewage facilities, ownership of radios and household appliances).[28] Widespread service deprivation and deteriorating overall conditions of life for the in-migrant population are more often assumed than demonstrated. Confounding evidence takes on added significance in light of an analysis of aggregate data on urbanization and political development in the Latin American region, which found that "while ideological and psychological factors play a role in assuring or undermining stability, they are keyed to the real level of material services [provided] to urban residents."[29]

The migrant's decision to remain in the urban center to which he has moved must be based on a modicum of perceived satisfaction with the urban environment. Whether or not this measure of satisfaction derives from the migrant's subjective, retrospective comparison of his present situation with his rural past, or from an actual improvement in objective conditions of living which he has experienced in the post-migration period, his intention to remain in the city serves as one indicator of success in meeting the basic challenges of economic assimilation. The data from the *Civic Culture* survey suggest a far more widespread satisfaction with his new environment than the migrant is normally credited with. Among those respondents in our migrant sample with less than two years of residence in the city where interviewed, 41% express a definite intention to remain there; and after four years of urban residence this figure rises to over 80%. A relatively low rate of remigration (i.e., return to the countryside as a negative response to the urban environment) is suggested by these data.[30]

The quality of a migrant's economic assimilation is obviously a factor of critical importance in determining whether he will later develop a "frustration gap" leading to alienation or political radicalism. It is reasonable to assume that successful assimilation depends in large part upon the migrant's capacity to display salable productive skills. This in turn depends upon his premigration preparation: his basic education and work experience. Among the newly-arrived migrants in our *Civic Culture* sample (those with under two years of urban residence), 70% had attained some level of primary education (up to six years of schooling); and among the migrants as a whole, 69% had achieved a primary education or higher. It would thus appear that the bulk of migrants arriving in Mexican urban centers possess at least the basic educational equipment which would enable them to learn productive skills in the post-migration period. The data contained in Table 1 provide some indication of their success in acquiring such skills over time in the city. Of importance are the relatively large proportions of skilled workers, artisans, office workers, and small

---

have access to basic urban services (see Olivé Negrete and Barba de Piña Chán, *Anales*, 14 (1962), *op. cit.*, p. 232).

[29] Francine F. Rabinovitz, "Urban Development and Political Development in Latin America," in Robert T. Daland (ed.), *Comparative Urban Research: The Administration and Politics of Cities* (Beverly Hills, Calif.: Sage Publications, forthcoming, 1969). Respondents in Kahl's *Measurement of Modernism* survey were asked to comment on the adequacy of social welfare services available to them in the Federal District. As the following data indicate, migrant evaluations were significantly more positive than those of metropolitans (the latter defined as respondents living in Mexico City who had been living in large cities at the age of 10):

	Migrants (N = 68)	*Metropolitans* (N = 247)
Very good	31%	22%
Fair	52	47
Poor	18	32

(Migrant/metropolitan differences are significant here at the .05 level. Controlling for age does not alter the observed relationship between migrant status and positive evaluation of services.)

[30] Migrants to the capital city in the *Measurement of Modernism* survey were asked whether the move had made their lives better or worse. Some 71% of these respondents reported an improvement in living conditions as a result of cityward migration, and 76% stated that they would not consider remigration. Among migrants to the Monterrey metropolitan area surveyed in the Monterrey Mobility Study, 92% reported satisfaction with their decision to migrate, citing improved living conditions as the most important source of satisfaction: Balán, *et al.*, *op. cit.*, pp. 124–28.

TABLE 1. COMPARATIVE OCCUPATIONAL DISTRIBUTIONS OF MIGRANTS, URBAN-BORN, AND MEXICAN WORK FORCE

Occupation	Economically Active Migrants by Length of Urban Residence (in years)					All Economically Active Migrants	Urban-born[a]	Mex. Work Force[b]	Ratio: % Migrants to % Work Force
	under 2	2–4	5–9	10–19	20, over

Skilled worker, Artisan	21	46	31	38	38	36	44	11	3.3
Office worker	21	17	20	17	9	15	21	6	2.5
Agricultural	11	10	2	4	10	7	4	54	.13
Small Tradesman	11	5	17	14	22	16	12	9	1.8
Professional, Technician	5	5	5	3	2	3	6	4	.75
High Management, Business	0	0	0	2	3	2	2	1	2.0
Total[d]	101%	100%	100%	101%	100%	100%	100%	100%	
(N)	(38)	(41)	(64)	(114)	(125)	(380)	(710)		
	$\chi^2 = 44.00$, $p < .05$					$\chi^2 = 27.74$, $p < .001$			

[a] This category, as employed in this and subsequent tables, includes those respondents in the *Civic Culture* sample for Mexico born in localities of over 10,000 population.

[b] Data is for the total economically active population in 1960. Computed from International Labour Office, *Yearbook of Labor Statistics* (Geneva, 1966), pp. 168–69. Migrant and native-born distributions include data on husband's occupation reported by economically inactive, female respondents.

[c] Mexican work force percentages for skilled and unskilled workers are estimated on the basis of data included in official census categories suggesting skill level.

[d] Totals in this and subsequent tables may not add to 100% due to rounding.

tradesmen among those migrants with ten or more years of urban residence. Moreover, there is some evidence here to challenge the common assumption that the vast majority of migrants arrive in the city bereft of any useful skills and destined only to swell the ranks of the unemployed. Indeed, only 32% of the recently-arrived (under two years' urban residence), economically-active migrants in our *Civic Culture* sample may be classified as unskilled workers. When we compare the migrants as a group with the urban-born, we find about twice as many migrants as urban-born classed as unskilled workers; but differences in the distributions of cases among the remaining occupational categories are not large.[31] Comparison of the occupational distribution of all economically-active migrants with the distribution for the entire Mexican work force shows skilled workers and artisans to be over-represented among the migrants by a factor of 3.3; white-collar (office) workers by a factor of 2.5; and higher managerial personnel by a factor of 2.0. The movement of migrants into these higher status occupational groups, as well as the sharp decline in migrants classed as unskilled workers as length of urban residence increases, suggest that whatever the handicaps from which migrants suffer upon arrival in the city they are not so severe as to constitute a major obstacle to occupational mobility.[32] Kahl's survey data also indicate that urban migrants in Mexico show a tendency toward slightly more upward mobility than the native-born populations of the cities to which they move, although there is substantial varia-

[31] For comparable survey findings from specific metropolitan areas, see Harley L. Browning and Waltraut Feindt, "Diferencias entre la población nativa y la migrante en Monterrey," *Demografía y Economía*, 2 (1968), 183–204; and Donald R. Case, "Differentiation among Manual Workers in Mexico City" (unpublished M.A. thesis, University of Texas at Austin, 1967), pp. 71–73, 96–106.

[32] The same conclusion is suggested by the data from the Monterrey Mobility Study. See especially Jorge Balán, "Are Farmers' Sons Handicapped in the City?" *Rural Sociology*, 33 (June, 1968), 160–74.

tion in mobility rates among occupational status categories.[33]

The *Civic Culture* data do not permit examination of the migrants' urban employment history or rate of job turnover. However, Table 2 shows the level of unemployment among employable migrants in our sample at the time of the survey. We find that the proportions of unemployed migrants and urban-born respondents are virtually the same. Although the level of unemployment among migrants is slightly higher than that among the total population of employable Mexicans, the latter figure conceals severe underemployment in rural areas, which, as we have noted, constitutes one of the major "push" factors in rural-urban migration.[34] Although no accurate underemployment data are available for urban areas, we can expect the problem there to be alleviated by the expansive capacity of the commercial and industrial sectors of the economy. In the Mexican case, absorption of increasingly large numbers of migrants into the major metropolitan areas has occurred under conditions of rapid and sustained industrial growth and relatively high structural mobility rates.[35] While apparently failing to contribute to higher real income levels for working-class Mexicans, this pattern of economic expansion is not without its implications for political stability and the moderation of demands upon governmental structures.[36]

TABLE 2. COMPARATIVE UNEMPLOYMENT LEVELS AMONG EMPLOYABLE MIGRANTS, URBAN-BORN, AND ALL EMPLOYABLE MEXICANS

Labor Force Participation Status	Employable Migrants	Employable Urban-born	All Employable Mexicans, 1960[a]
Unemployed	1.8%	1.3%	1.6%
Employed	98.2	98.7	98.4
Total	100.0%	100.0%	100.0%
(N)	(218)	(380)	
	$\chi^2 = 0.02$	(N.S.)[b]	

[a] Percentages computed from México, Secretaría de Industria y Comercio, Dirección General de Estadística, *VIII Censo general de población, 1960: Resumen general* (Mexico, D.F., 1962), Table 22, p. 362.1.

[b] In this and subsequent tables, the designation (N.S.) indicates that differences between migrant and urban-born respondents are not, by chi-square test, significant at or beyond the .05 level of significance.

[33] See Joseph A. Kahl, "Social Stratification and Values in Metropoli and Provinces: Brazil and Mexico," *América Latina* (Brazil), 8 (January-March, 1965), p. 31; and Kahl, *Measurement of Modernism, op. cit.*, pp. 175, 182–183.

[34] Mexican government statistics for 1959 indicate that over half of the nation's five million agricultural workers were employed for only 145 days or less during the year (cited in U.S. Department of Labor, Bureau of Labor Statistics, *Labor in Mexico* [Washington, D.C., 1963; BLS Report No. 251], p. 40).

Another objective measure of the quality of economic assimilation among urban migrants is family income level. The distribution of incomes for our *Civic Culture* sample of migrant respondents presented in Table 3 shows a larger proportion of migrant families than urban-born families falling into the lowest income bracket. This may be attributable to the larger proportion of migrants employed in personal services, small crafts industry, and very small-scale retail

[35] See Jorge Balán, "Migrant-Native Socioeconomic Differences in Latin American Cities: A Structural Analysis," *Latin American Research Review,* 4 (Spring, 1969), p. 21; and José Luis Reyna, "Some Patterns of Occupational Mobility: The Mexican Case," *Social Research,* 35 (Autumn, 1968), 540–564.

[36] Cf. Gino Germani, "Social and Political Consequences of Mobility," in Neil J. Smelser and S. M. Lipset (eds.), *Social Structure and Mobility in Economic Development* (Chicago: Aldine, 1966), pp. 391–394; and W. R. Armstrong and T. G. McGee, "Revolutionary Change and the Third World City: A Theory of Urban Involution," *Civilisations* (Belgium), 18 (1968), 353–376. Official statistics show that between 1950 and 1957, the income of the poorest 20% of the Mexican population decreased in both relative and absolute terms: Ifigenia M. de Navarrete, "Income Distribution in Mexico," in Enrique Pérez López, *et al., Mexico's Recent Economic Growth* (Austin: University of Texas Press, 1967), pp. 166, 170. The data on migrant perceptions of upward mobility and job satisfaction provided by the *Measurement of Modernism* survey are of particular interest in this connection. Migrants were asked whether they had gotten farther than they expected (in terms of occupational or career objectives), or not as far. Obtained responses are as follows:

Farther than respondent expected	72%
Equal with what respondent expected	23
Not as far as expected	5

In addition, some 72% of the same respondents reported that they held jobs which were "good" or "fine" in their estimation.

TABLE 3. COMPARATIVE FAMILY INCOME LEVELS OF MIGRANTS, URBAN-BORN, RURAL, AND ALL MEXICAN FAMILIES

Average Monthly Income in Mexican Pesos[a]	% of Migrant Families[b]	% of Urban-Born Families	% of All Mexican Families[c]	% Rural Families[d]
499 or under	56	34	61	73
500–999	22	28	26	19
1000–1499	13	16	10	8[f]
1500–2499	6	10	2	
2500–4999	3	7	1[e]	
5000 or over	1	5		
Total	101%	100%	100%	100%
(N)	(422)	(736)		
	$\chi^2 = 66.30$, $p < .001$			

[a] At the time of the surveys which provided income data for this table, Mexican pesos could be exchanged for U. S. dollars at a rate of 12.50 per dollar. This is the current exchange rate.

[b] Data for both migrant and non-migrant (urban-born) families reported in the *Civic Culture* survey are for the time period June–July, 1959.

[c] Calculated from Secretaría de Economía, Dirección General de Estadística, Departmento de Muestreo, *Ingresos y egresos de la población de México, en le mes de octubre de 1956: investigación por muestreo* (Mexico, D. F., 1958), pp. 76, 98, 119, 141, and 162. Time period for the data is October, 1956.

[d] Data from Pablo González Casanova, *La Democracia en México* (Mexico, D. F.: Editorial ERA, 1967), Table LXV, p. 277. Time period is 1961–1962.

[e] Includes all reported incomes above 2500 pesos per month.

[f] Includes all reported incomes above 1000 pesos per month.

trade, where wage levels have not kept pace with those in other sectors of the urban economy.[37] Comparison of the distribution of migrant incomes with those of all Mexican families shows that 23% of the migrant families fall into the higher income brackets (1000 or more pesos per month), as against the national proportion of only 13%. And the incomes of migrant families are clearly superior to those of families in the rural areas from which they come, where just 8% of the incomes fall into the upper-income groupings.

Whether or not we perceive the objective economic basis for the oft-hypothesized "frustration gap" characterizing the situation of the migrant, there is yet need to examine his subjective evaluation of that situation and the prospects for improvement. The data presented in Table 4 show a positive expectation of achieving family economic improvement among 57% of the cases in our *Civic Culture* migrant sample. This compares favorably with the level of positive expectations of improvement among the urban-born population.[38] Certainly there is little here to support the notion of widespread and deep frustration of expectations which is basic to much writing on urbanization and political instability in Latin America. Our data also indicate a curvilinear relationship between migrant expectations of improvement and length of urban residence, with the highest level of positive expectations occurring among those with five to nine years of residence in the city. It might be inferred from this that migrant expectations upon arrival in the city and in the early post-migration period are relatively low; that greater awareness of opportunities and the general affluence of urban society creates high, probably unrealistic expectations during the 5–9 year period of residence; that in subsequent years frustration of such inflated goals leads the migrant to adjust his aspirations closer to the possible. Thus our migrant data lend support to a general proposition regarding the attitudinal consequences of persisting deprivation: "In the very long run men's expectations about the goods and conditions of life to which they are entitled tend to adjust to what they are capable of attaining."[39]

What is the relationship between objective economic condition and subjective mobility expectations among the in-migrant population? Our data from the *Civic Culture* sample show a slight, positive relationship (Pearson $r = .14$, significant at the .002 level) between objective condition (indexed by family income level) and expectations of improvement. But even among the most objectively deprived, as indicated by family incomes of less than 500 pesos per month (U.S. $40), some 53% of the migrants have expectations of future economic improvement. This finding leads us to hypothesize that even for

	$\chi^2 = 20.79$, $p < .05$					$\chi^2 = 8.93$, $p < .05$	

[a] Item: "How will the economic situation of your family change in the next ten years?"

those individuals whose premigration training and experience is such that it significantly impedes social and economic mobility, city life brings satisfactions of a non-objective nature (e.g., opportunities for individual ownership of a homesite on the urban periphery) which help considerably to offset perceptions of relative deprivation and hold promise of future betterment.[40] Present and projected rates of Mexican economic expansion suggest that the goals of many aspirants from the lower-income strata of the newly-arrived, in-migrant population—as well as children of migrants with longer urban residence—may meet frequent disappointment. Nevertheless, the migrants' persistent non-perception of structural obstacles to vertical mobility seems supportive of the existing socio-political order.

VI. SOCIO-PSYCHOLOGICAL ADJUSTMENT

The gap between mobility expectations and concrete socio-political orientations is not bridged directly, however. There are a number of variables of a socio-psychological nature which may also figure prominently in the calculus of support or non-support. All such variables relate to the alleged difficulties of migrants in making a successful mental adjustment to the urban setting. The deterioration of nuclear family and extended family bonds is postulated in much of the literature as one inescapable consequence of integration into the urban-industrial culture. As early as 1952, however, Oscar Lewis presented evidence that, at least in the case of Mexico, strong family and kinship ties were wholly compatible with urban life and industrialization.[41] Lewis's subsequent work in this area, based on a much wider sample of migrant families, served to corroborate these early observations and showed that migrant family life in Mexico City remained quite stable, and that extended family ties increased rather than decreased. He found that the average size of nuclear families in the city was at least as large or somewhat larger than in the migrants' native village.[42] Still more recent field studies of migrants to Mexico City have shown that migra-

[40] For a contrasting analysis, based on survey data for Mexico City only, in which urban experience is found to be essentially unrelated to subjective dimensions of living conditions, see Clifford Kaufman, "Urbanization and Political Involvement: Limited Reflections on the Case of Mexico City" (unpublished paper presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September, 1968), pp. 6–10. On migrant satisfactions deriving from expanded opportunities for home ownership in marginal settlement zones, see Deneke, "The *Colonias Proletarias* of Mexico City," *op. cit.*, pp. 77–78, 108; William L. Flinn, "The Process of Migration to a Shantytown in Bogotá," *Inter-American Economic Affairs*, 22 (Autumn, 1968), p. 88; William P. Mangin, "Mental Health and Migration to Cities: A Peruvian Case," in D. B. Heath and R. N. Adams (eds.), *Contemporary Cultures and Societies of Latin America* (New York: Random House, 1965), p. 549; and Talton F. Ray, *The Politics of the Barrios of Venezuela* (Berkeley: University of California Press, 1969), pp. 154–156.

[41] Oscar Lewis, "Urbanization Without Breakdown: A Case Study," *Scientific Monthly*, 75 (July, 1952), 31–41.

[42] Oscar Lewis, "La cultura de la vecindad en la ciudad de México," *Actas del III Congreso Internacional de Americanistas* (2 vols.; San José, Costa Rica, 1959), Vol. I, pp. 387–402.

tion is increasingly by family group and have failed to detect any significant deterioration of the family or kinship group in the post-migration situations.[43] My data strongly support these findings. The average nuclear family size of migrants in the *Civic Culture* sample is over 5.1 persons, with 35% of the migrant families having seven or more members. The distribution of migrant nuclear family sizes is essentially comparable to that of the urban-born and of all Mexican families according to the 1960 census. Thus we find little empirical basis for the notion of widespread primary-group breakdown as a significant factor contributing to migrant disorientation and maladjustment in the cities.

A potentially more important factor, more difficult to measure and interpret, is that of anomie: the lack of stable cognitive orientations to a changed situation. In terms of classical folk-urban social theory, anomic response to urban life may take the form of a significant decline in religious participation, a high divorce rate, a loss of both trust and a sense of cohesion in interpersonal relations. All such phenomena are indicative of a breakdown of traditional norms, value systems, and social controls, with an attendant potential for embracing extremist ideologies or movements. Thus such demographic statistics as percentage of population divorced in a heavily Roman-Catholic Latin American country have been used as indicators of breakdown in traditional value systems and predictors of the percent voting for the radical left.[44] No clear pattern emerges from our data on anomic response among migrant and urban-born populations in Mexico. Table 5 shows that the migrants as a whole tend to be slightly more an-

[43] See Butterworth, *op. cit.*, pp. 266–267; and Balán, *et al., op. cit.*, pp. 128–151.

[44] Cf. Soares and Hamblin, *op. cit.*, p. 1055.

TABLE 5. INDICATORS OF ANOMIC RESPONSE TO URBAN ENVIRONMENT

Indicator	Migrants by Length of Urban Residence (in years)					All migrants	Urban born
	under two	2–4	5–9	10–19	20 or more		
Frequency of Participation in Religious Services	%	%	%	%	%	%	%

						$\chi^2 = 0.20$ (N.S.)	

omic than the urban-born on two of the four indicators provided by the *Civic Culture* survey. The differences, however, are not statistically significant. The contention that "migration may produce anomie, but only in the long run," since it may take considerable time for migrants to lose traditional norms and values carried over from rural life,[45] is not confirmed here. In fact, the data indicate that participation in religious observances, social trust, and sense of social cohesion tend to increase among migrants with longer residence in the city.[46]

What specific politically-relevant attitudes might we expect to be associated with anomic response to the urban environment? Although this question has never been explored adequately in survey research involving Mexican or other Latin American populations,[47] we would, on theoretical grounds, expect an anomic person to be confused and bewildered by events in politics and government; to exhibit feelings of political ineffectiveness or impotence; and to display cynical attitudes toward the men and practices governing society and the state and their responsiveness to his needs.[48] Four items were selected from the *Civic Culture* interview schedule in an attempt to identify and measure some of these attitudinal correlates of anomie among members of our migrant sample.[49] Agreement with items 1 and 2, a "not-at-all-likely" response for item 3, and a "no" response for item 4 in our Table 6 could be interpreted as anomic. The data suggest that, in general, migrants are more inclined toward this type of response than urban-born Mexicans, although once again most differences between the two populations are slight. Only with respect to feelings of political cynicism (as measured by item 4) do migrants score significantly higher on the anomie index than urban-born respondents.

VII. POLITICIZATION

Even if one were to accept the prevailing orthodoxy that rapid urbanization provides a basis for political radicalization and instability through the creation of what we have defined as the "frustration gap" and the "anomic gap," still other variables of an explicitly political nature would have to be examined before attempting to assess the stabilizing or destabilizing consequences of the urbanizing process for developing political systems. Levels of migrant politicization, for example, are crucial in determining the conditions of stability or instability in rapidly expanding urban areas. Before people engage in political action, before they are moved to protest, articulate grievances or make demands upon governmental structures, they must be at least minimally politicized.[50] As we have noted, much of the recent developmental literature assumes a high level of politicization among urban populations, even among those elements whose

[45] *Ibid.*, p. 1062; and Soares in Lipset and Rokkan, *op. cit.*, p. 489.

[46] Lewis also found that the religious life of Tepoztecan migrants to Mexico City appeared to be "at least as vigorous" and "more Catholic and disciplined" than in their native village (Oscar Lewis, "Further Observations on the Folk-Urban Continuum and Urbanization with Special Reference to Mexico City," in Philip M. Hauser and Leo F. Schnore (eds.), *The Study of Urbanization* [New York: Wiley, 1965], p. 495). Cf. Bryan R. Roberts, "Protestant Groups and Coping with Urban Life in Guatemala City," *American Journal of Sociology*, 73 (May, 1968), 753–767.

[47] See, however, the limited data on anomie and attitudes toward political participation among lower-class urban dwellers in Buenos Aires, reported in Margot Romano Yalour de Tobar and Maria Magdalena Chirico, "Clase obrera, anomia, y cambio social," *Cuadernos del Centro de Estudios Urbanos y Regionales* (Argentina), No. 9 (1967), 1–39.

[48] See Charles D. Farris, "Selected Attitudes on Foreign Affairs as Correlates of Authoritarianism and Political Anomie," *Journal of Politics*, 22 (February, 1960), p. 53; and Herbert McClosky and John H. Schaar, "Psychological Dimensions of Anomy," in Heinz Eulau (ed.), *Political Behavior in America* (New York: Random House, 1966), p. 483.

[49] Two of these items (listed as items 1 and 2 in Table 6) were also included as measures of political efficacy in the Survey Research Center's 1956 study of the U.S. electorate. For U.S. data and interpretations, see Angus Campbell, *et al.*, *The American Voter* (New York: Wiley, 1960), pp. 515–519.

[50] In this discussion we will adhere to the concept of politicization developed in the work of Daniel Goldrich, who conceives of the politicization process as "a continuum ranging from lack of perception of the revelance of government to one's life, through perception of it, to active involvement in politics" (Goldrich, "Toward the Comparative Study of Politicization in Latin America," in D. B. Heath and R. N. Adams (eds.), *Contemporary Cultures and Socieiies of Latin America* [New York: Random House, 1965], p. 361). "This concept of politicization has two dimensions: one, the perception of the personal relevance of government, is perceptual [or cognitive]; the other, political activity, is overt and behavioral" (Goldrich, *Sons of the Establishment* [Chicago: Rand McNally, 1966], p. 11).

TABLE 6. ATTITUDINAL CORRELATES OF ANOMIE

political consciousness has been awakened only recently through cityward migration. Thus we find references to the threat of "teeming urban populations . . . so highly politicized that they have become in a sense loaded revolvers pointed at the responsible governments and on the verge of being triggered off at the slightest provocation."[51] Both the assumption of uniformly high urban politicization levels and of increased political cognition as a result of migration to the big city appear largely untenable, however, in the Mexican case. While some studies have detected a slight correlation between migration and

[51] Lucian W. Pye, "The Political Implications of Urbanization in the Development Process," in *United States Papers Prepared for the United Nations Conference on the Application of Science and Technology for the Benefit of the Less Developed Areas* (7 vols.; Washington, D.C.: U.S. Government Printing Office, 1962), Vol. VII, p. 87.

heightened identification with the nation-state as a political entity,[52] they have failed to demonstrate any appreciable increase in migrant familiarity with, or interest or participation in, anything even resembling "national affairs," or even in popular programs of urban-based, national political groups.[53] Oscar Lewis found that among residents of two Mexico City *vecindades* (high-density, centrally-located, "conventional" slums) political apathy and lack of involvement in both formal and informal associations were just as common among persons who had been in the city for over 30 years as among recent arrivals.[54] Once again our data corroborate Lewis's observations. In Table 7 we find that among both migrant and urban-born populations less than half of the respondents have attained even minimal levels of politicization; and that on all nine indicators, the migrants as a whole exhibit lower cognition than the urban-born. On most indicators the migrants show considerable improvement with longer residence in the city, a pattern which persists with chronological age, sex, and education controlled. But even among those with 20 or more years of urban residence, 67% have failed to develop any sense of the personal relevance of the national government; 69% perceive no effect of local government; and only 13% regularly follow political and governmental affairs. The proportion of migrants who pay any attention to national election campaigns actually declines over time from 51 to 44 percent. Thus we find that, in terms of the taxonomy employed in the original analysis of these data, most migrants fall into the category of "parochials," i.e., those citizens manifesting little awareness of, or interest in, the national political system.[55]

Examination of the data on several behavioral indicators of politicization (Table 8) reveals essentially the same pattern. On all but one indicator (political party membership) the migrants show slightly lower participation frequencies than the urban-born population, but in most cases the differences do not prove statistically significant. On just one indicator (voting) do migrants show appreciably higher levels of political activity with longer residence in the city. Even after 20 years of urban residence, however, only 54% of the migrants eligible to vote in the 1958 election did so.[56] And when controls for age, sex, and education are introduced, we find educational attainment to be far more important in determining participation levels on this and other indicators than either length of urban residence or the other control variables.[57] Thus the general trends emerging from our analysis of migrant politicization in the Mexican context lend little support indeed to the common conception of the in-migrant populations of Latin American cities as increasingly politicized, "available masses." Even if differences in cognition levels between new arrivals and long-time urban residents are in fact

[52] See, for example, Guy T. Ashton, "Early Adulthood and Mexican National Identity: Consequences of Migrations by Yucatec Adolescent Shoemakers," *América Indígena,* 27 (April, 1967), 301–316; Butterworth, *op. cit.,* p. 265; and Lelio Mármora, "Marginalidad y conciencia nacional en grupos migrantes," *Aportes* (France), No. 7 (January, 1968), 29-46. Cf. Frederick W. Frey, "Socialization to National Identification among Turkish Peasants," *Journal of Politics,* 30 (November, 1968), pp. 943–944.

[53] At least one analyst has suggested that urban migration promotes competitive party politics in Mexico because of the increased access to individuals resulting from urban clustering, which "permits and encourages transmission of political values to persons who formerly were untouched by political propaganda" (Johnson, *Urbanization and Political Change in Latin America, op. cit.,* pp. 99–100). Although similar arguments have been advanced in subsequent writings (see, for example, Burnett and Johnson, *Political Forces in Latin America, op. cit.,* p. 51), we are not aware of any data which demonstrates empirically the purported linkage between growing strength of opposition parties in Mexico and increased support from *in-migrant* populations now in a situation of "political availability."

[54] Lewis, in Hauser and Schnore, *op. cit.,* p. 496.

[55] Cf. Almond and Verba, *op. cit.,* pp. 17–18; and Gabriel A. Almond and G. Bingham Powell, Jr., *Comparative Politics: A Developmental Approach* (Boston: Little, Brown, 1966), p. 53.

[56] The national turnout of eligible voters in the 1958 general election was 49.4%. This was the first such election in which both men and women voted. More recent cross-national survey research in other Latin American countries also fails to reveal any marked increase in participant orientations among in-migrant populations with longer exposure to the urban environment. In Argentina and Chile, for example, longer urban residence was found to be *negatively* related to higher participation frequencies (unpublished research, Project on the Social and Cultural Aspects of Economic Development, Department of Social Relations, Harvard University, 1969).

[57] This finding is reflective of those reported in Almond and Verba, *op. cit.,* especially pp. 379–387, and elsewhere in the literature of political development with respect to education as the most accurate predictor of participation levels.

[a] Organizations "in any way concerned with governmental, political, or public affairs;" which "take stands on or discuss public issues or try to influence government actions."

attributable to longer exposure to the urban environment, such differences do not necessarily imply a greater readiness to engage in articulation of demands or otherwise to seek access to the political decision-making process. Hence the importance of dealing separately with cognitive and behavioral dimensions of the politicization process among urban migrants.[58]

VIII. LEGITIMACY ORIENTATIONS

It may be argued, however, that urbanization as an agent in Latin American political stability or instability should not be assessed primarily in terms of its effects on politicization levels. More important as a threat to the stability of the political system is the ideological radicalization of urban politics; the development of nonsupportive, alienated attitudes and orientations toward the system among the migrant masses, due either to the nature of the assimilation experience or to factors intrinsic to the urban environment itself. Such feelings could be intensified and exploited by extremists or dissident political groups for the purpose of undermining the legitimizing argument for the system. The empirical questions to which these arguments lead are (1) the extent to which nonsupportive attitudes are distributed through the populace; and (2) the extent to which such feelings are actually translated into behavior contributing to conditions of political instability. In a one-party-dominant system of the Mexican type, such behavior may take the form of support for opposition parties or movements committed to major alterations of political structure or rules of the game, as well as for overt acts of political violence.

Our data on legitimacy orientations of migrants (Table 9) do not suggest any widely-shared attitude potential which could provide the basis for political radicalism and instability in Mexican urban areas. The migrant respondents in general demonstrate a relatively high level of system affect; in most cases higher than urban-born respondents. Some 85% of all migrants believe that the ideals and goals of the Mexican Revolution have already been realized or that people are still working to realize them; only 10% believe that the government party's policies or activities would "probably" endanger the national welfare.[59] The data for items four and five do show a significant decline in system affect among migrants with respect to local and national government outputs, as length of urban residence increases; yet even among those with 20 or more years of residence in the city, 85% continue to believe that Revolutionary goals and ideals have been achieved or are still being pursued actively, and just 10% believe that the official party's actions would eventually endanger the nation's welfare.[60]

It has been suggested that an estimate of the prospects for stability or instability in Latin American countries might be arrived at through simultaneous attention to two key dimensions of national systems, legitimacy and politicization.[61]

---

[58] Cf. Daniel Goldrich, *et al.*, "The Political Integration of Lower Class Urban Settlements in Chile and Peru," *Studies in Comparative International Development*, 3 (1967–1969), pp. 14–15; and Daniel Pécaut, "The Urban Working Class," in Claudio Véliz (ed.), *Latin America and the Caribbean: A Handbook* (New York: Praeger, 1968), pp. 677–678.

[59] A similar pattern emerges from the data on system affect provided by the *Measurement of Modernism* survey. The two relevant items and obtained response distributions are as follows:

	Migrants (N = 68)	*Metropolitans* (N = 249)
(1) Mexico is much better off today because we had the Revolution	79%	77%
The Revolution hasn't solved our problems	21	23
(2) Political parties that exist now are providing adequate solutions for the problems of Mexico:		
Always	21%	19%
Sometimes	62	53
Rarely	13	19
Never	4	10

[60] These results are consistent with Almond and Verba's original finding that Mexicans in general are more alienated from governmental output than from the system itself, especially as the latter relates to and embraces the goals and symbolism of the Mexican Revolution: see *The Civic Culture, op. cit.*, pp. 495–496; and Sidney Verba and Gabriel Almond, "National Revolution and Political Commitment," in Harry Eckstein (ed.), *Internal War* [New York: Free Press, 1964], pp. 205–232). As Kahl has noted, this ambivalence is explained in part by the general cynicism pervading Mexican political culture. "Since a Mexican expects everyone to be out for himself, he is not outraged by self-seeking politicians and union leaders. Nor would he anticipate that things would be very different if the political system were changed. Therefore he does not blame the Revolutionary institutions for the chicanery of his fellow citizens, which he sees merely as a reflection of the Mexican temperament. . . . He believes in a government whose representatives he distrusts": *Measurement of Modernism, op. cit.*, p. 116.

[61] See Daniel Goldrich, "Toward an Estimate of

[a] Among those cognizant of the ideals and purposes of the Mexican Revolution.
[b] Among those perceiving effect of the national government on daily lives.
[c] Among those cognizant of effect of local government on daily lives.
* Too few cases.

These two dimensions can be conceived as ranging from support through acquiescence to opposition; and from non-politicization through moderate politicization to high politicization. Assessing significant groups of people according to their position within these dimensions would then indicate potential sources of political stability or instability.[62] The matrices appearing as Tables 10–11 order the data for our migrant sample in this manner. Important in an assessment of the potential for instability stemming from urbanization in Mexico is the fact that the largest group of migrants according low legitimacy to the political sytem (the "opposed," clustered in cell *C* of the matrices) are also among the least politically aware and involved (the "non-politicized"). Thus, while these individuals may harbor basic political dissatisfactions, their attitudes would not appear to be immediately threatening to system stability. Of equal significance is the fact that no more than five out of over 340 cases cluster in cell *A* of the matrices, where we would expect to find those most predisposed to radical political activity.

IX. POLITICAL RADICALIZATION

In an effort to assess the extent to which non-supportive legitimacy orientations and feelings of alienation among migrants are translated into actions, or advocacy of actions, which might contribute to political instability, we may examine patterns of support for opposition parties and movements. Kenneth F. Johnson has documented several cases among "numerous open expressions of citizen discontent with Mexican public policy in urban areas," focused on such matters as excessive taxation and service deprivation.[63] He regards as one indicator of political radicalism among the materially-depressed urban masses their support for such "independent civic protest movements against established urban regimes . . . [movements which have] preferred to remain aloof from any of the established political parties."[64] However, the data for our migrant sample presented in Table 12 suggest a very low level of potential support for such movements among the in-migrant population. Only 9% of the migrants regard protest demonstrations as the most effective way of influencing government decisions; some 37% believe this form of political action to be the least

TABLES 10–11. LEGITIMACY-POLITICIZATION MATRICES[a]

Legitimacy Orientation[b]	Politicization (Cognitive)[c]					
	Highly Politicized		Moderately Politicized		Non-Politicized

($N = 342$; $\chi^2 = 30.99$, $p < .001$)

Legitimacy Orientation[b]	Politicization (Behavioral)[d]					
	Highly Politicized		Moderately Politicized		Non-Politicized	
Opposed	*A*	0	*B*	12	*C*	35
Acquiescent	*D*	7	*E*	48	*F*	76
Supportive	*G*	6	*H*	64	*I*	100

($N = 348$; $\chi^2 = 29.23$; $p < .001$)

[a] Based on data from the *Civic Culture* migrant sample only. Cell frequencies represent actual numbers of cases. "Don't know" cases have been excluded from the matrices.

[b] As measured by a summative index constructed from responses to items 2 through 5 in Table 9, and validated through inter-item correlations. Respondents were assigned a score of 0, 1, or 2 on each item, from least to most legitimacy accorded the system. Summing scores across all items in the index, a respondent's total score may range from 0 to 8. A score of 0–2 is coded as "opposed;" a score of 3–5 as "acquiescent;" and one of 6–8 as "supportive."

[c] Measured by a summative index constructed from items 1, 2, 3, 4, 7, and 8 in Table 7. Respondents were assigned a score of 0, 1, or 2 on each question, from lowest to highest level of political awareness indicated by the response. Summary scores range from 0 to 12. A score of 0–3 is coded as "non-politicized;" a score of 4–8 as "moderately politicized;" and one of 9–12 as "highly politicized."

[d] Measured by a summative index constructed from items 4 and 5 in Table 8. Respondents were assigned a score of 0, 1, or 2 on each item, from lowest to highest level of political involvement indicated. Sums of scores range from 0 to 4. A score of 0 is coded as "non-politicized;" a score of 1–2 as "moderately politicized;" and one of 3–4 as "highly politicized."

[a] Among those expressing a party preference. The PAN (Partido de Acción Nacional) is Mexico's principal right-wing opposition party; the PP (now the PPS, or Partido Popular Socialista) is its counterpart on the left.

[b] For the candidate of the PAN in the 1958 presidential election, among those voting. For all practical purposes, "opposition voting" in 1958 was limited to the PAN, since the PP and another splinter party, the PARM, supported the official party's candidate for president. The Communist Party's candidate received fewer than 10,000 write-in votes.

[c] Those respondents scored as "opposed" on the legitimacy orientation index employed in Tables 11–12.

* Too few cases.

effective method. Even among politically alienated migrants, the same proportion of respondents perceive demonstrations as the most effective tactic, and 43% consider them the least effective.

With respect to preference for opposition political parties, we find once again a very low level of migrant support. Only 3% of all migrant respondents in the *Civic Culture* sample express a preference for an opposition party; 10% report voting for the opposition candidate in the 1958 presidential election. These migrant proportions are somewhat lower than those for the urban-born population. There is no large increase in migrant support for opposition parties as length of urban residence increases. Thus it would appear, on the basis of survey data, that the increased political availability of large segments of the populace now concentrated in the nation's major urban centers has not been effectively translated into support for groups opposed to incumbent national leaders. On the basis of the same evidence it might also seem reasonable to conclude that the stability of the electorate and the ability of the ruling party to control the political life of individual states or localities would not be closely tied to the volume of migration into such political units. However, aggregate electoral and demographic data show an increasingly strong, positive correlation between net in-migration into these entities and frequency of opposition voting (Spearman rank coefficient = .28 for the 1958 presidential election; .40 for the 1961 congressional elections; and .60 for the 1964 presidential election).[65] Yet in such cases as Baja California Norte and the Fed-

[65] Computed for all federal entities experiencing a net gain in population due to in-migration in the 1950-1960 period, from electoral data reported in González Casanova, *La democracia en México, op. cit.*, Table 46, p. 249, Table 55, p. 258, and Table 57, pp. 262–63; and net in-migration data presented in Cabrera, *Demografía y Economía,* 1 (1967), *op. cit.*, Table 12, Col. 2, p. 357. This trend does not appear when urbanization is indexed by simple percentage change in proportion of state population residing in rural areas: see Barry Ames, "Bases of Support for Mexico's Dominant Party" (unpublished paper, Dept. of Political Sci-

eral District, which have experienced the highest rates of both in-migration and opposition voting, it is doubtful that the relative potency of migration in determining electoral outcomes has been nearly as great as the aggregate indices suggest. In Baja California, for example, level of economic development, distance from the national capital and proximity to the United States, historical antecedents, localized issues of political corruption and abuse of power, the quality of state and local governmental outputs, and the dynamism and political skill of opposition leadership, are all key factors to be considered in attempting to account for the high incidence of opposition voting in the state's major urban centers.[66] Moreover, there would appear to be a strong possibility that patterns of partisanship among urban migrants are dependent in large measure upon the political coloration of the city in which they take up residence.[67] While his rural and/or small-town socialization insures that the migrant is far from a *tabula rasa* upon arrival in the big city, he is frequently, as Hobsbawm has observed, an individual with "no prior commitment—or even potential commitment—to any version of urban or national politics, or indeed to any beliefs which could form the basis of such politics."[68] Under these circumstances, a migrant vote against the official party's candidate for president or congressman may represent more a conformist adaptation to the dominant political opinion of the host community than a protest reaction against the hardships of adjustment to city life. If the ineptitude, non-responsiveness, or corruption of the official party regime at the local level has aroused widespread dissatisfaction, the probability of opposition voting among migrants as well as all other elements in that locality to fill elective positions at all levels of the system is greatly enhanced. The disparity between the apparently strong relationship of in-migration to opposition voting in such states as Baja California Norte and the Federal District as reflected in the aggregate data, and the much weaker association between migrant status and opposition voting reflected in our national survey data underscores the hazards of the so-called "ecological" or "aggregative" fallacy in writing and theorizing on Latin American urbanization and its socio-political consequences. Lacking better data, it may seem efficacious to attempt inferences about the behavior of micro units (such as migrants) using aggregate data from macro units (such as states).[69] But the need anticipated by some researchers for testing the results of macro-level, ecological-correlational analysis of the association between urbanization and political attitude and activity patterns against sample survey data, is confirmed here.[70]

X. CONCLUSION

Two general impressions which emerge strongly from the foregoing examination of the Mexican case are (1) a sense of the extraordinary complexity of the urbanization phenomenon itself; and (2) the inadequacy of most conventional theory for dealing with the phenomenon in research on political instability in a Latin American context. As the results of field studies undertaken in a number of countries begin to accumulate, it becomes increasingly evident that there is a high degree of within-region variation with respect to patterns and consequences of urbanization. It would be inaccurate to regard the outcomes flowing from such a process as tending essentially toward stability or instability in the political order, from either a long- or short-term perspective.[71] Certainly in the Mexican case

ence, Stanford University, 1968, pp. 23–24).

[71] Cf. Huntington, *op. cit.*, p. 283. As Kalman Silvert has suggested, there is need to abandon the conventional view that "the mere fact of an urban agglomeration means a specific set of things for the persons who live in that agglomeration" in favor of a more probabilistic viewpoint, "that urban conglomerations in any part of the world can lead to a very broad variability of human reactions" (Silvert, "Seminar Summary," *Proceedings* of the Seminar on Social Science and Urban

there can be little doubt that rapid urbanization has contributed to conditions of material scarcity, overcrowding, and service deprivation in the big cities, while straining the absorptive capacity of both the public and private sources of employment. Yet it would appear that the rate of demand creation among the urban masses, and therefore the magnitude of the collective "frustration gap," is not as great as has been assumed. Thus given sustained economic expansion and a modicum of improvement in real income levels, the fact of discrepancy between rates of urbanization in the nation and the capacity of commerce and industry to provide adequate employment opportunities at the rate of in-migration may not be crucial to the stability of the political system.[72] Maintenance of system support will depend upon expansion of governmental performance capabilities, at all levels, and on the success of the ruling party-government apparatus in coöpting leaders emerging from the newly urbanized population into supportive political roles.[73] In any event, we find little empirical evidence to support the standard conception of the city as essentially a radicalizing environment. Nor does there appear to be an empirical basis for frequent perceptions of imminent threat to existing authority structures stemming from the rapid influx of migrants to cities. In Mexican *colonias proletarias*, as in the *favelas* of Brazil and the *barriadas* of Lima,[74] contradictions between the migrant's values regarding the city as a place of economic opportunity and his actual situation seem more likely to lead to cynical criticism of the "malfunctioning" of authority structures and institutions (due to self-seeking politicians, corrupt and unresponsive bureaucrats, etc.), than to a political questioning of the legitimacy of such structures. Finally, we find that there is little or no difference between migrants and urban-born individuals on many indices of social condition, political attitudes, and behavior patterns; and that the ratio of migrants to non-migrants is probably one of the less critical factors accounting for urban political phenomena. It would appear that a similar pattern of relationships obtains in some other Latin American countries undergoing rapid urbanization, even though these nations for the most part are not characterized by the conditions of general political stability and economic progress which mark the Mexican case. Evidence reported from such diverse countries as Brazil, Chile, Guatemala, Peru, and Venezuela indicates that even though first and second generation migrants frequently comprise a large proportion of the electorates they join, their presence in the urban center does not seem to result in any significant radicalization of politics in their new place of residence.[75] Nor do there appear to be conspicuous differences between migrants and city-born residents with respect to

Jones, "Urbanization and Voting Behavior in tinctive mix of economic pressures, social con-Venezuela and Chile, 1958–1964" (unpublished M.A. thesis, Stanford University, 1967); Mangin, *Latin American Research Review*, 2 (1967), pp. 82–85; Lisa Redfield Peattie, *The View from the Barrio* (Ann Arbor: University of Michigan Press, 1968), pp. 139–40; Sandra Powell, "Political Participation in the Barriadas [of Lima, Peru]: A Case Study" (unpublished paper, Dept. of Political Science, San Francisco State College, 1969); José Arthur Rios, "El pueblo y el político," *Política* (Venezuela), (February, 1960), 11–36; Bryan Roberts, "Politics in a Neighborhood of Guatemala City," *Sociology* (London), 2 (May, 1968), 185–204, and *idem*, "Poverty and Politics in Guatemala City" (unpublished paper presented at the Annual Meeting of the American Anthropological Association, Seattle, Wash., November, 1968). Nevertheless, the radicalization conception cannot

several key socioeconomic attributes and attitudinal patterns.[76]

If some kind of migrant/non-migrant dichotomy does not prove useful in analyzing the conditions which tend toward alienation and instability in a given area, then what tack should investigators take in trying to deal with the urbanization phenomenon and its impact on Latin American political systems? It would appear that specific metropolitan areas and metropolitan subunits and their varying patterns of interaction with larger political environments provide the most promising focus of attention for research in this field. The migrant population of a large city contains a large and disparate array of social types, who may react in very different ways to the same set of basic social and economic conditions, or who may in fact be exposed to very different types of conditions imposed by urban settlement patterns. Even geographically contiguous "squatter settlements" on the periphery of the central city may differ sharply in the degree to which they and their inhabitants are integrated into urban social and political life. As several investigators have argued recently, settlement-zone integration should be viewed as a significant variable, subjecting migrants to a distinctive mix of economic pressures, social controls, and political influences.[77] Some settlements

simply be dismissed as mere folklore lacking *any* empirical referent in Latin American experience, past, present, or future. As Germani and others have noted, the conventional wisdom would appear to have a rather high degree of fit with the Argentine situation in the Perón era (see Gino Germani, "The Transition to a Mass Democracy in Argentina," in Arpad von Lazar and R. R. Kaufman (eds.), *Readings in Latin American Politics* (Boston: Allyn and Bacon, 1969), pp. 138–140; and Andújar, *Revista Paraguaya de Sociología*, 6 (1966), *op. cit.*); and it may also be accurately descriptive of some aspects of the situation in Santo Domingo during the 1965 Dominican revolt (see José A. Moreno, *Barrios in Arms: Revolution in Santo Domingo* (Pittsburgh: University of Pittsburgh Press, forthcoming), Chap. 5). Moreover, the evidence is as yet too fragmentary to discount the applicability of the radicalization proposition to second and third generation in-migrants, even though the data which have been reported thus far do not reveal any significant radicalization of the second generation in terms of support for extremist parties, frustration of socio-economic expectations, or diminished confidence in existing socio-political institutions: see Goldrich, *Human Organization*, 23 (1964), *op. cit.*, pp. 332–333; and Adolfo Gurrieri, *Situación y perspectivas de la juventud en una población urbana popular* (Santiago de Chile: United Nations, Economic Commission for Latin America, 1965; Doc. E/LACCY/BP/L.2), pp. 16-18, 24–27. Yet with respect to newly-arrived migrants and first generation in-migrants in general—the groups to which the commonly-accepted notions of "explosive potential" are most frequently applied—theorists do indeed "have a burden of proof that there is an empirical reality that corresponds to their abstractions": Kahl, *Measurement of Modernism, op. cit.*, p. 97.

PARTY COMPETITION AND WELFARE POLICIES IN THE AMERICAN STATES*

CHARLES F. CNUDDE
AND
DONALD J. MCCRONE
University of Wisconsin

Recent comparative, quantitative studies of state politics conclude that party competition and other political variables have little or no impact on important state policies such as per pupil expenditure, old age assistance, unemployment compensation, and aid to dependent children.[1] These are rather unexpected and disturbing conclusions for they disconfirm relationships predicted by some of the most important theoretical formulations concerning democratic politics. Before re-examining the bases for these conclusions, a review of theory is in order.

I. THEORY

V. O. Key, Jr., set the context for examining the effects of political variables on state policies.[2] He stressed the importance of two-party competition, or bi-factionalism in one-party states, as a determinant of policy. Key sees the degree of party competition as crucial because it reflects the extent to which politics is organized or unorganized. Party competition by producing some semblance of an organized politics lessens the difficulty of lower status groups in sorting out political actors and issues, thereby enabling them to promote their own interests more effectively. Since state social welfare policies are undoubtedly relevant to the interests of "have-nots," we can utilize state expenditures in this area as a measure of the success that these groups have enjoyed. Key's formulation, then, would lead to a simple two variable model:

$P = e_1$
$S = k_1P + e_2$
Where P is inter-party competition, S is expenditure on social welfare, and e_1 and e_2 represent error or variables left out of the system, and k_1 is a constant.

This model simply states that, all other things being equal, increasing competitiveness will produce increased social welfare expenditures.

Lockard's analysis of policy in the New England states brought some refinements to Key's model.[3] Lockard argued that states with complex economies would be more likely to have competitive parties since the diversity of economic interests would provide a context within which two partyism could flourish. He also noted that this diversity makes it difficult for a few powerful interests to dominate policy-making. The addition of Lockard's thinking to the basic model is straightforward:

$D = e_1$
$P = k_1D + e_2$
$S = k_2P + e_3$
Where D is the level of economic development and all other symbols are the same as above.

This model states that there is a developmental sequence between the three variables; a high level of economic development yields inter-party competition which in turn produces the level of welfare expenditures.

The more recent literature rejects the developmental sequence predicted by the Key-Lockard observations.[4] Utilizing multiple and partial correlational analysis, or their non-parametric analogues, this recent literature finds that when socio-economic factors are held constant, the impact of party competition largely disappears,

* The research reported here was supported by the Graduate School of the University of Wisconsin and by funds granted to the Institute for Research on Poverty at the University of Wisconsin by the Office of Economic Opportunity pursuant to the provision of the Economic Opportunity Act of 1964. The conclusions are the sole responsibility of the authors. They wish to acknowledge gratefully the assistance of Martin Abravanel.

[4] Dawson and Robinson, *op. cit.*, and Dye, *op. cit.*

while the effects of socio-economic development do not vanish when party competition is held constant. From these findings these researchers conclude that party competition does not serve as an intervening variable between socio-economic development and policy. They conclude that party competition and policy are both dependent on socio-economic development. Their revised model then is:

$$D = e_1$$
$$P = k_1D + e_2$$
$$S = k_2D + e_3$$

All symbols are the same as above.

This model states that any association between competition and social welfare expenditures is spurious. There is no causal connection between competition and welfare, rather they are both caused by socio-economic development.

This model is certainly unexpected in that the theoretical formulations, if not the conclusions, of these recent studies are perfectly consistent with those of Key and Lockard. The framework common to these studies is that of Easton's systems analysis which stresses the importance of environment, process, and outputs.[5] Economic and social development are treated as aspects of the environment, party competition is categorized as an aspect of the political process, and governmental expenditures are conceptualized as the outputs of the system. Easton's notion that aspects of the political process are a consequent of the environment and serve to translate factors of that environment into policy outputs is also common to these efforts. These research designs, then, began with the hypothesis that political factors such as party competition act as intervening variables between the socio-economic environment and output measures. This hypothesis is the same as that embodied in the Lockard model above. That this hypothesis appears to be disconfirmed, raises serious questions concerning assumptions regarding the importance of political variables in explaining policy outcomes.

Yet, if we return to examine the theoretical notions underlying the predictions from Key and Lockard, it may still be possible to find grounds upon which to reexamine the relevance of political variables. First, it seems clear that Key's thinking would not lead us to expect that party competition, or any other political variable, would serve as an important explanatory variable for all types of public policies. While this statement may seem trivially true, it leads to an important question. What kinds of policy would party competition be important for? Key's answer seems to depend on what he thought are the politically significant questions; questions of the sort that may have become lost in recent literature.

> The significant question is, who benefits from political disorganization? Its significance is equalled only by the difficulty of arriving at an answer. There probably are several answers, depending on the peculiar circumstances in each case. Politics generally comes down, over the long run, to a conflict between those who have and those who have less. . . . It follows that the grand objective of the haves is obstruction, at least of the haves who take only a short-term view. Organization is not always necessary to obstruct; it is essential, however, for the promotion of a sustained program in behalf of the have-nots, although not all party or factional organization is dedicated to that purpose.[6]

Party competition, then, may not have an appreciable impact on some types of policies, but Key's discussion would lead us to specify the conditions under which it would have its greatest effect: the have-not oriented policies. If party competition serves to provide political organization useful to the have-nots in their struggle with the haves, then party competition would be most intimately related to those policies which are central to that struggle. Key's status conflict formulation enables us to discard the simplistic hypothesis that party competition is important for explaining policy in general. We would hypothesize that party competition would differentially explain policies as a function of the centrality of the policy area to the have, have-not struggle. For example, party competition may not be important for many kinds of education policies. Although they may belong to a social welfare dimension, education policies fall much less clearly in this dimension than other more controversial and more have-not oriented policies such as aid to dependent children.[7]

If we expect the explanatory strength of party competition to vary with the type of policy, it seems but a short theoretical leap to expect similar variation in the importance of other characteristics of the political system. In fact it is possible to consider variables which are most important in exactly those situations in which variables such as party competition are least important. What we are thinking of here

[6] Key, *loc. cit.*

[7] See, Ira Sharkansky and Richard I. Hofferbert, "Dimensions of State Politics, Economics, and Public Policy," in this issue of this REVIEW.

are the perceptual and attitudinal distributions of the individuals who occupy the important political roles in state systems. Thus as Lockard has pointed out competition may place rather rigid electoral restraints upon the kinds of policy appeals that can be made.[8] However, where these external restraints do not exist, or are weakest, the greatest room would seem to exist for individual variation in policy-making. In these situations, our level of explanation would remain meager as long as we restrict our measurements to non-individual based variables.

Of course such variables may never be gathered systematically for any but a few states at any one point in time. In this paper, we wish to merely raise the possibility of the importance of such variables. The explanatory value of such variables in other areas of political research emphasizes the fact that very little effort has been expended at rounding out the measurement of the many political variables that may intervene between state environments and policy.[9] From these additional theoretical considerations we can derive the following model:

$$D = e_1$$
$$P_1 = k_1D + e_2$$
$$P_2 = k_2D + e_3$$
$$P_3 = k_3D + e_4$$
$$\cdot$$
$$\cdot$$
$$\cdot$$
$$P_n = k_nD + e_{n+1}$$
$$k_{n+1}P_1 + k_{n+2}P_2 + \ldots + k_{2n}P_n + e_{n+2}$$

Where $P_2, P_3, \ldots P_n$ are political variables other than party competition which intervene between socio-economic development and social welfare policy.

This model states that there are "n" number of political variables all of which serve to transform aspects of the environment into public policy.

We of course do not know if this model best fits any data. However, we can use it to make predictions about what would happen if it were descriptive of the policy making process and we measured only one or a few of the intervening variables in any one study. If, for example, we measured only P_1, then the model would be:

$$D = e_1$$
$$P_1 = k_1D + e_2$$
$$S = k_2P_1 + k_3D + e_3$$

In this model social welfare policies are the result of two forces, both of which originate in socio-economic development. One is transmitted through the intervening variable party competition and the other appears as a direct effect of development because we have ignored the additional intervening political variables.

In review, the evidence and theoretical formulations we have considered suggest three primary models which have some kind of relevance to the issues in this literature. The first we shall label the Key-Lockard model because we derived it from their work and it calls for a developmental sequence between the three types of variables. The second we shall call the Dawson-Robinson model because those authors were the first of a series to postulate a spurious relationship between competition and social welfare policy. The third model depends on our reworking of these theoretical strains and can be thought of as a hybrid of the others. This model predicts effects from both party competition and socio-economic development with party competition's effect as part of a developmental sequence originating in development.

II. METHODOLOGY

If we can derive three different models from the existing theoretical formulations, the next step is to select a methodology that enables us to choose between them empirically. Severe difficulties arise at this point, however, because our theory has to some extent outpaced conventional research techniques. For this reason, we will develop the logic of a cluster of tests which will help to alleviate these problems.

Normally in a test of a developmental sequence like the Key-Lockard model $j \rightarrow k \rightarrow i$ we control for the hypothesized intervening variable (k) to determine whether the original relationship between the independent (j) and dependent (i) variables remains. In making this test we are attempting to choose between the developmental sequence model and another model in which the test variable does not intervene and effects from the independent variable remain. This is the case because we would not control for the hypothesized intervening variable unless there were zero-order relationships between the three variables in the first place. On the other hand, when controlling in a test for spuriousness such as the Dawson-Robinson model would require, we normally partial for the in-

[8] Lockard, *op. cit.*

[9] For example, see Warren E. Miller and Donald E. Stokes, "Constituency Influence in Congress," this REVIEW, 57 (1963), 45–56.

dependent (j) variable which hypothetically accounts for the original relationship between two dependent (k and i) variables. In making this test, we are attempting to choose between the spuriousness model and another in which an effect remains between the latter two variables. Once again we proceed with the test only after determining whether zero-order relationships exist between all three variables.

In both tests, we are attempting to choose between the hypothesized model and a second. However, in this instance, we are attempting to choose between models associated with the two tests: developmental sequence and spuriousness models. At this point, the conventional testing procedures becomes inadequate.

If we use partial correlation coefficients, or some analogous technique, often we can not distinguish between these models. In such controls, we are attempting to hold "constant" that variation in other variables which is due to the control variable. We can conceptualize what is involved in these procedures by thinking of residual variation after the control. In the developmental sequence test, we hold constant variation in the independent and dependent variables which is related to the control variable. The relationship which remains after the control, therefore, is the association between the residuals in both variables. Thus if the variation in the dependent variable which is due to the independent variable is entirely transmitted through the intervening variable, then, the residual relationship should be zero in the pure case. If the residual relationship is of a magnitude to make us think that it does not really depart from that of the original relationship, usually we would reject the developmental sequence model. However, this does not mean that we can then infer the spuriousness model, because it is not the only alternative model.

Similarly, if we make the spuriousness test, we examine the residuals (which are not related to the control variable) between the two variables under test. If a relationship remains after the control, we may want to reject the spuriousness model, but this test alone does not allow us to infer that a developmental sequence exists.

Moreover, even if we use the two tests in combination often we will be unable to distinguish between the two models. The reason for this is that when we proceed with the test for spuriousness, we will observe a reduction in the relationship between the two variables under test when either model fits the data. If the relationship is that of a developmental sequence, when we control for spuriousness we remove variation due to the most independent variable in the sequence. Therefore, the controlled relationship between the remaining variables is due to their residuals which are unrelated to the control variable. If the relationship is that of a developmental sequence, we will be examining the correlation between residuals that are left over after variation due to the initial variable in the sequence has been removed. In this case, we would not expect a very high partial relationship because with the first causal variable in the sequence removed, we are left with relationships that are primarily outside the sequence. In other words, we will observe reductions in the partial relationship with this kind of control when the relationships are *either* spurious *or* developmental.[10] As a result we can not use this test to distinguish between the two models. This is the procedure utilized in the recent literature.

The advice when either of these models is a possibility is to partial using unstandardized regression coefficients rather than partial correlation. Since these coefficients are unstandardized they are unaffected by the reduction in variation due to controlling for background factors. Therefore, if we test for spuriousness when a developmental sequence exists, the magnitude of the partial regression coefficient will remain unchanged and we will not improperly infer spuriousness.

However, this strategy also breaks down when in addition to the developmental sequence and spuriousness models we also have our third hybrid model as a possibility. Thus, if both a direct effect from the independent variable and a developmental sequence through an intervening variable exists, the behavior of the regression coefficients will be affected by a control for spuriousness. In this situation the magnitude of the regression coefficient between the intervening and dependent variables will be reduced because we will be subtracting from that association any relationship due to the direct effect of the independent variable. Therefore, if we make this test, we may confuse the spurious with the hybrid model because we will observe a reduction in the regression coefficients in both cases. Due to the complexity of our hybrid theory, the introduction of our model to the set of possibilities for testing represents a second breakdown in the straight-forward methodology of causal inference.

To overcome this second difficulty, we propose that partial regression coefficients be utilized with controls for both spuriousness and de-

[10] For the argument in this and the subsequent paragraph, see, Hubert M. Blalock, Jr., *Causal Inferences in Non-Experimental Research* (Chapel Hill: U. of North Carolina Press, 1964), pp. 83–87.

TABLE 1. BEHAVIOR OF REGRESSION COEFFICIENTS UNDER TESTS FOR SPURIOUSNESS AND DEVELOPMENTAL SEQUENCE AND MODEL TO BE INFERRED

Inference	Test for: Spuriousness	Developmental Sequence
Spuriousness	Reduction	No Reduction
Developmental Sequence	No Reduction	Reduction
Hybrid	Reduction	Reduction

velopmental sequences—a combination of controls which might lead to improper inferences if partial correlations are used, as discussed above. If a test of spuriousness, on significant zero-order regression coefficients, does not yield a reduction in the regression of party competition on a welfare policy, we may safely infer the most appropriate model is that of a developmental sequence. On the other hand, if the test does produce a reduction in the regression coefficient, we are still faced with the problem of choosing between the spuriousness and hybrid models for both models predict a reduction.[11]

We have a basis for inference, however, if we also test for a developmental sequence. Both the hybrid and developmental sequence models predict a reduction in the regression of the environment on the policy, while the spuriousness model predicts no reduction.[12] In other words, only when we observe a reduction in the regression coefficient under *both* tests should we infer the hybrid model. When the spuriousness and developmental sequence tests yield a reduction in one case but not in the other, we are in a position to choose between the other two models. Table 1 summarizes this discussion.

Yet a third difficulty remains. If we focus on the *magnitude* of the regression coefficients and use the significance test most commonly associated with regression (the F test), we would often conclude that our controls resulted in regression coefficients which are not significant. The reason for this is that this test, like correlation, is related to the amount of variation in our variables. If we happened to control for a background variable, as in the test for spuriousness, we would be reducing that variation perhaps to the point of making the partial regression not significant.[13] Normally, we avoid this outcome by being careful not to control for background variables. However, when two of the theoretical models under test require controlling for background variables, we must confront this difficulty.

The proposed solution in this situation is to make use of the fact that our theory predicts a *change* in the magnitude of the regression coefficients. Thus the null hypothesis is that the magnitudes will remain the same even after the control. Because of this, we can utilize confidence limits within which the magnitudes could have varied on a chance basis. Our research problem then is not just whether the controls reduced their magnitudes, but whether they reduced them by an amount greater than they could have by chance, given a significance level of, say, .05. If the partial is smaller than the corresponding lower confidence limit we conclude that there has been a significant reduction, if it is not smaller, we conclude that we cannot reject the null hypothesis.

III. ANALYSIS

Key's notions of variation in the relevance of party competition to policy, according to the centrality of the policy to the conflict between the haves and have-nots, led us to select four state expenditure policies for analysis—per pupil expenditure, old age assistance, unemployment compensation, and aid to dependent children.[14] All of these policies can be thought of as belonging to the same dimension of social welfare liberalism, broadly defined. Important differences exist, however, in the degree to which they are defined in the United States as embodying a welfare dimension. In other words, they vary in how central they are to the conflict between haves and have-nots. Thus, although educational policy is very important as an arena of conflict between the haves and have-nots, it includes rewards for both groups and has not been defined generally as a policy specifically designed for the poor, at least in recent times. Aid to dependent children, on the other hand, is designed explicitly to provide funds for the poor and is frequently defined as a "dole." Old age assistance and unemployment compensation, defined as policies designed to assist those who have worked long and hard before retirement or who are *temporarily* unemployed, would seem to occupy something of a middle ground between education and aid to dependent children.

* Not significant at .05 level.

** Control slightly, but not significantly, increases its value.

The test for spuriousness between party competition[15] and each of the four policies by controlling for each of four socio-economic factors is shown in Table 2. In every policy area, at least one control variable significantly reduces the regression coefficient between party competition and the policy. The regression for per pupil expenditure is reduced significantly by income, non-agricultural occupations, and urbanization. The regressions for old age assistance, unemployment compensation, and aid to dependent children are significantly reduced by education, education and income, and income, respectively. As discussed in the methodology section above, we are now in a position to reject the Key-Lockard pure developmental sequence model, because it predicts no reduction in the regression coefficients. On the other hand, we are not in a position to choose between the spuriousness and hybrid models, because they both predict a significant reduction.

Before proceeding to the test for a developmental sequence, we would like to note two other implications of Table 2. First, the socio-economic factor that reduces the regression coefficient the most for each policy area, income for per pupil expenditure, education for old age assistance, income for unemployment compensation, and income for aid to dependent children, varies considerably in how much reduction it produces. Thus, income reduces the regression for per pupil expenditure by eighty-eight percent (88%), while income only reduces the regression for aid to dependent children by thirty-two percent (32%). The reductions for old age assistance and unemployment compensation, sixty percent (60%) and fifty-six percent (56%), fall between these two poles. In other words, the extent to which we can reject the model at issue may correspond to the rough ranking of the centrality of these issues to the have, have-not struggle.

Second, in every policy area, there is at least one socio-economic variable which does not significantly reduce the regression of party competition on the policy. Education does not signifi-

[15] Our measure of party competition is drawn from Austin Ranney, "Political Parties," in Herbert Jacob and Kenneth Vines (eds.), *Politics in the American States: A Comparative Analysis* (Boston: Little, Brown and Co., 1965), pp. 64–65, which combines competition for governor, the lower house, the upper house, and percent of divided executive-legislative control into one overall index of party competition. Our indices of wealth (per capita income), urbanization (percent urban), education (median school year completed), and percent in nonagricultural occupations for 1960–61 were drawn from Bureau of the Census, *Statistical Abstract of the United States: 1962* (Washington: U.S. Government Printing Office, 1962).

cantly reduce the regression coefficient for per pupil expenditure. Urbanization and income do not affect the regression coefficient for old age assistance. Urbanization and non-agricultural occupations do not reduce the regression for unemployment compensation. Three variables, education, urbanization and non-agricultural occupations fail to have an effect on aid to dependent children. This suggests that all four variables are not always equally relevant as control variables for all policy areas, as implied by previous research.[16] The theoretical implications of this are clear. We must have a clear notion of what it is that we are controlling for and why.

This finding also emphasizes that we must be very careful when we utilize multiple controls. For example, since income is the only socio-economic variable to significantly reduce the regression coefficient between party competition and aid to dependent children, to control for the other three socio-economic factors may lead to unwarranted inferences. The variables which do not significantly reduce the effect of party competition may still be significantly related to that variable. When we control their effects in a multiple-partial correlation analysis, we are further reducing the variation in the political variable which may artificially reduce the party competition-dependent variable correlation. Such gross use of controls, then not only obscures what may be important theoretical differences between these socio-economic factors, but also may lead to unwarranted inferences of spurious relationships due to "over-controlling."

Table 3 shows the tests for a developmental sequence. Controlling for party competition fails to produce a significant reduction in the regression of income on per pupil expenditure and education on old age assistance (almost significant, $p = .08$), though the other three socio-economic factors are sharply reduced in their effects. In the other two policy areas, however, the control for party competition significantly reduces the regression coefficients of all four socio-economic

[16] See Dye, *op. cit.*

variables with aid to dependent children and unemployment compensation.

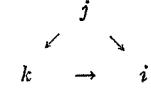
The combination of the two tests suggests that the spurious model is the better inference for per pupil expenditure and old age assistance. The test for spuriousness produced a significant reduction in the regression coefficients, while the test for a developmental sequence did not.

The more appropriate inference, in aid to dependent children and unemployment compensation would seem to be the hybrid model. A significant reduction in the regression coefficient between party competition and these two policies in the test for spuriousness is matched by a significant reduction in the regression coefficients of the four socio-economic factors in the test for a developmental sequence.

IV. CONCLUSION

Our analysis leads us to several major conclusions. First, our examination of the methodology utilized in previous research into the effects of political variables on state expenditure policies convinces us that the spurious model now predominant in state politics literature rests on shaky empirical foundations. Reliance on correlational analysis can lead to unwarranted causal inferences.

Second, only for per pupil expenditure and old age assistance does the spurious model appear to be the more appropriate inference. Per pupil expenditure policies, especially, seems to be virtually a pure case of spuriousness as a function of the wealth of a state.



Third, because we have not found sufficient support for the relatively simple models in the areas of aid to dependent children and unemployment compensation our hybrid model appears as an alternative. Although it is not possible to estimate the exact magnitude of the impact of party competition if this is the appropriate model, it does indicate that this political variable does have an impact. Rejection of the spuriousness model then does suggest that even if there are direct effects from the environment party competition still serves as an intervening variable.

Fourth, as might have been predicted by Key, we tend to have different models with different policies. The extent to which we can reject the spuriousness model seems to vary as a function of the centrality of the policy to the struggle between the haves and have-nots. Our inferences therefore are consistent with the theory that given the advantages possessed by the haves, the organization, continuity, and visibility of alternatives provided through inter-party competition is important for the capacity of have-nots to attain policies in their own interests.

Finally, we think several research directions are suggested by our analysis. The model outlined above which suggested that there may be n number of intervening political variables implies that we need to place great stress on conceptualizing and measuring relevant political variables. To the extent that this model is the appropriate one we will continue to have trouble estimating the effects of the few political variables measured. The variation between models across the few policies considered in this analysis also suggests that we need to place as much, if not more stress on conceptualizing and measuring policy outputs beyond expenditures, especially outputs relevant to the struggle between haves and have-nots.[17]

APPENDIX

As Blalock points out if we make the test for spuriousness (control by the background variable) when the appropriate model is a pure developmental sequence the regression coefficients will be unaffected, i.e., the simple and partial coefficients will be equal. However, if we make the same control when the appropriate model is the hybrid case the coefficient will be reduced. We can prove this assertion by examining the hybrid model below. In addition to the developmental sequence $j \rightarrow k \rightarrow i$ we also have a direct effect of j on i. Employing the equation for partial regres-

sion coefficients and the fact that $(bjk)\ (bkj) = r^2jk$ we can set bij equal to $(1-r^2kj)\ (bij \cdot k) + (bik)\ (bkj)$. When we make the test for spuriousness we then have:

$$1. \quad b_{ik \cdot j} = \frac{bik - (bij)(bjk)}{1 - r^2jk}$$

$$2. \quad = \frac{bik - [(1-r^2kj)(bij \cdot k) + (bik)(bkj)]bjk}{1 - r^2jk}$$

$$3. \quad = \frac{bik - (bjk)(1-r^2kj)(bij \cdot k) - (bik)(bkj)(bjk)}{1 - r^2jk}$$

$$4. \quad = \frac{bik - (bjk)(1-r^2kj)(bij \cdot k) - (bik)(r^2kj)}{1 - r^2jk}$$

[17] See Donald J. McCrone and Charles F. Cnudde, "On Measuring Public Policy," in Robert E. Crew, Jr. (ed.), *State Politics: Readings on Political Behavior* (Belmont, California: Wadsworth Publishing Co., 1968), pp. 523–530 for an attempt to measure a qualitative output of state systems—anti-discrimination laws.

5. $$=\frac{bik-(bik)(r^2kj)-(bjk)(1-r^2kj)(bij\cdot k)}{1-r^2jk}$$

6. $$=\frac{bik(1-r^2kj)-(bjk)(1-r^2kj)(bij\cdot k)}{1-r^2jk}$$

$$bik\cdot j$$

7. $$=bik-(bjk)(bij\cdot k)$$

In other words the value of the partial regression coefficient will be that of the simple after it has been reduced by the effects of the other two links. If Blalock's pure developmental sequence were actually the appropriate model, $bij\cdot k$ would equal zero and according to equation #7 $bik\cdot j$ would equal bik, i.e. no reduction.

We can similarly show that the developmental sequence test (control for an intervening variable) when this model is the appropriate one will also result in a reduction in the coefficient. In that case we set bik equal to $(1-r^2jk)\ (bik\cdot j)+(bij)\ (bjk)$ and when we make the test we have:

$$bij\cdot k$$

1. $$=\frac{bij-(bik)(bkj)}{1-r^2kj}$$

2. $$=\frac{bij-[(1-r^2jk)(bik\cdot j)+(bij)(bk)](bkj)}{1-r^2kj}$$

3. $$=\frac{bij-(bkj)(1-r^2jk)(bik\cdot j)-(bij)(bjk)(bkj)}{1-r^2kj}$$

4. $$=\frac{bij-(bkj)(1-r^2jk)(bik\cdot j)-(bij)(r^2kj)}{1-r^2kj}$$

5. $$=\frac{bij-(bij)(r^2kj)-(bkj)(1-r^2jk)(bik\cdot j)}{1-r^2kj}$$

6. $$=\frac{bij(1-r^2kj)-(bkj)(1-r^2jk)(bik\cdot j)}{1-r^2kj}$$

$$bij\cdot k$$

7. $$=bij-(bkj)(bik\cdot j)$$

Once again the value of the partial will be that of the simple after reductions due to the other two links. On the other hand, if the purely spurious model is the appropriate one in this test we know that $bik\cdot j=0$ which means that according to equation #7 $bij\cdot k=bij$. In other words the control will not reduce the value of the coefficient.

DIMENSIONS OF STATE POLITICS, ECONOMICS, AND PUBLIC POLICY*

IRA SHARKANSKY

AND

RICHARD I. HOFFERBERT
Cornell University

I. INTRODUCTION

A question often posed by students of American state politics is: "Do state political systems leave a distinctive imprint on patterns of public policy?" Prior to recent years the nearly automatic response of political scientists was an unqualified "yes." More recent research has led to a qualified but increasingly confident "no."[1]

Several recent publications have explored relationships between various indices of state politics, socio-economic characteristics, and public policy. The general conclusion has been that central features of the political system such as electoral and institutional circumstances do not explain much of the variation in policy. There are occasionally high correlations between individual measures of voter turnout, party competitiveness, or the character of state legislatures and some aspects of governmental spending. But these political-policy correlations seem to disappear when the effect of socioeconomic development is controlled.

These are disturbing findings. They have not gone unchallenged.[2] But the challenges, rather than reassuring those who have asserted the relevance of parties, voting patterns, and government structures, have demonstrated that the burden of proof now rests on those who hypothesize a politics-policy relationship. The problem has not been resolved.

Part of the problem may rest on the conceptualization and measurement of the central variables. Electoral balance or alternation in office is not "inter-party competition," except in the most mechanical sense. Compare Massachusetts' loose-knit party structure to the centralization of Connecticut's. "Party competition" is not the same as "party organization." And party competition, voting habits, and patterns of apportionment fall far short of being equivalents of "political systems." We have been too simple-minded in our measurement of "politics" and "policy." Concepts are, hopefully, ever more closely approximated by the things we use to denote them. We propose to advance further in the approximation of "politics," "economics," and "policy" as they are used in comparative state research. As an added payoff, we offer some clarification of their interrelationships.

Our results confirm some and challenge other findings of recent research. Because we deal with factors and not isolated variables, we can speak with improved precision of which *dimensions* of policy respond to what *dimensions* of politics and economics. Our findings show that different social and economic characteristics have different relevance for policies, and their relevance varies between substantive areas of policy. Furthermore, central features of state politics are important for some policies, even when socioeconomic variation is controlled.

* Separate grants to each of the authors from the Social Science Research Council Committee on Governmental and Legal Processes provided financial support for the work that is reported here.

Wilson, *City Politics and Public Policy* (New York: Wiley, 1968), Chapter 1; and Duane Lockard, "State Party Systems and Policy Outputs," in Oliver Garceau (ed.), *Political Research and Political Theory* (Cambridge: Harvard University Press, 1968), pp. 190–220.

II. METHODS OF INDEX CONSTRUCTION

The conceptualization of state policy making into three sectors—social, political-governmental, and policy—has proven sufficiently fruitful to warrant its continued use. We have followed the guidance of previous studies in separating the objects of our study in this manner. Within each sector, however, there is no *a priori* reason to assume that the component variables are unidimensional or of equal weight. For that reason, we wish to employ techniques which test for dimensionality and which assess the relative contribution of specific variables to the patterns of relationship.

In any situation where one seeks to pin numbers on a concept, a wise strategem is to employ multiple measures in the hope that they will, in a sense, triangulate on the conceptual target more accurately than any single item.[3] Multiple measurement, however, still leaves one guessing what is the common element of the many variables used. Averaging scores or ranks and constructing composite indices of unweighted items runs the risk of making several unwarranted and unnecessary assumptions.[4] It allows for no indication of the relative impact of the items included. Multiple regression analysis runs a similar risk. It provides no means for handling the multiple measures of dependent variables. A strong case can be made for a lengthy list of indicators, but one also needs a mechanism for sorting out their commonality and diversity. If used with some sensitivity, factor analysis serves this need.[5]

Some writers have been critical of some uses to which factor analysis has been put, particularly with the increased availability of pre-packaged programs and sophisticated computing facilities. Two major criticisms are relevant in the present context. First, it is charged that factor analysis has been used in lieu of theory.[6] If one simply plugs into the machine all of the data at his command, some kind of factors will emerge. Factor analysis is not a substitute for theory. There must be some prior rationale which justifies the particular variables fed into the computer. Secondly, the technique has been criticized because the factors which emerge often seem to make little sense in terms of the theory with which one is working.[7] Theory is juggled to accommodate the machinery.

This is not the appropriate context in which to explore the intricacies of factor analysis. But we do recognize the necessity to account for some of the major criticisms and to point out how we have tried to minimize the difficulties in our inquiry. We have attempted to avoid these pitfalls in two ways. First, the variables we include have been employed because of their widespread currency in analyses by other scholars and the appealing theoretical rationale which

[3] For a lucid critique of single indicator analysis and a discussion of the methodological justification for multiple indicators see Eugene J. Webb, Donald T. Campbell, Richard D. Schwartz, and Lee Sechrest, *Unobtrusive Measures: Nonreactive Research in the Social Sciences* (Chicago: Rand McNally, 1966), pp. 3ff.

[4] For an example of such an index, see Hofferbert, "The Relation . . . ," *op. cit.*

[5] The technique of factor analysis starts from the basic assumption that interrelations among separate variables signal the existance of underlying traits—or "factors"—that they share in common. A factor analysis manipulates a collection of variables in order to discern the various patterns of relationships among them. The groups of variables that relate closely to one another, but only loosely (or not at all) to variables in other groups are extracted as the principal factors. The individual variables that show the strongest relationships with other members of their factor have, in the language of factor analysis, the highest *loadings*. A variable's *loading* is, in effect, the coefficient of correlation between that variable and the underlying factor. By knowing the variables with the highest loadings on each factor, it is possible to infer something about the underlying traits that the factor represents. The variables with the highest loadings come closest to representing the underlying trait, although it is unlikely that any single variable represents that trait perfectly. The factoring technique used with the political and service variables employs orthogonal rotation. The device examines the correlation matrix of the individual variables and extracts factors whose members show maximum correlations among themselves and minimum correlations with the members of other factors. The program used is "Image," by Walter Stoly, Mass Communications Center, University of Wisconsin, Madison, version of July 2, 1968. For an explanation of techniques used in the socioeconomic factor, see Hofferbert, "Socioeconomic Dimensions . . . ," *op. cit.* Although Hofferbert employed oblique rotation in the extraction of his factors, the comparability to our political and service factors is not appreciably affected. The intercorrelation of the two socio-economic factors for 1960 is .023.

[7] See, for example, John E. Mueller, "Some Comments on Russett's 'Discovering Voting Groups in the United Nations,'" this REVIEW, 61 (March, 1967), 146–148.

these analysts have offered.[8] Second, as will be apparent, the factors we obtain *do* make sense and we have employed a number of checks to insure that the apparent sense they make is not an artifact of the technique.[9] In order to use the results of factor analysis to test relationships among various dimensions of politics, economics, and public policy we derived "factor scores" for each state from the combination of its value on the individual variables and the loading of each variable on each factor. The derivation of state scores on the socioeconomic factors is discussed elsewhere.[10] With factor scores as our independent and dependent variables, we use simple, partial and multiple correlation techniques to assess relationships between dimensions of state economics, politics, and public policy.

Political Factors. In choosing the items for construction of the political indices an effort was made to include a comprehensive list of characteristics that have long been of concern to political scientists. We chose measures of participation and party competition, the character of the legislative, judicial and executive branches of state government, and the individual and mutual aspects of state, local and intergovernmental fiscal structures.

The measures of turnout and competition assess prominent aspects of the electoral process, involving contests for both governor and United States Representative. The measures of party competition include both the spread of the vote received in recent elections and the distribution of legislative and gubernatorial control between parties and over time.

The variables indicating government structures, personnel and revenues tap several aspects of state and local government that may affect perception of and responsiveness to citizen interests. The variables pertaining to the legislature include three separate indices of apportionment equity, plus the number of legislators, the length of the legislature's session, the number of committees, the salary of members and total expenditures for legislative services, and the number of bills introduced and passed at a recent session. Other scholars have used these variables to assess the representativeness of state legislatures, their "professionalism" and their activism.[11] Several of the variables pertaining to the executive branch assess the magnitude and professionalism of the civil service, and the formal nature of leadership in the executive branch. They show the relative number of employees and their conditions of work. Two variables relative to executive leadership are the score of each state's governor on an index of formal authority,[12] and the number of adminis-

[8] But we have been sensitive to the possibility of biased results. Certain initial steps have been taken to reduce this bias. Factor analysis cannot be relied upon to define the dimensions of a complex phenomenon (e.g., the state political system), particularly if the collection of variables subject to factor analysis is pre-loaded with many measures of the same phenomenon, each of which is highly correlated with others. Thus our first task was to insure that we did not "stack" our deck of variables with highly intercorrelated measures ($r > .70$) of the same phenomenon. This problem was particularly acute in the case of measures of party competition. Similar screening of the policy variables we examined did not reveal comparable redundancies.

[9] To maintain *prima facie* relevance, we use factor analysis in "stages" first to select from among a large collection those variables that load highly on principal factors and then to define the loadings of these variables on factors that contain only those highly-loaded components. In this way, the factor technique produces relatively "pure" factors, devoid of large numbers of variables that contribute only weakly to the principal factors. In both the political and policy analyses, a large number of variables load low on two principal factors, and several variables load about equally on each principal factor. In order to simplify these factors for the purposes of clarity and further analysis, we eliminated all variables loading below .5 on both principal factors and those loading at least .5 on one but above .4 on the other factor in each sector. (The variables surviving this elimination are noted as such on Tables 1 and 3.) We then made separate factor analyses of the variables that remained after this culling procedure. (The results in Tables 2 and 4.) The values derived from this final set of analyses constitute the bases for constructing indices of the political and policy sectors of our model.

trative officials who are directly elected. The age and length of the state constitution and the number of its amendments have been used by one scholar to assess the activism of state interest groups and their orientation toward constitution-building.[13] Also examined are terms, official qualifications, compensation and pension opportunities of the state judiciaries; these should denote some central aspects of judicial professionalism.

We measure state and local tax systems by the proportion of revenues raised from the major taxes. Each tax has a distinctive impact upon a particular segment of the population;[14] thus, the composition of state and local revenue systems may reflect the political strength of different economic groups, and affect the relationship between each group of taxpayers and state and local governments.

Several measures of intergovernmental relationships assess the mutual dependence of state and local governments and the role of federal agencies in financing public services. These variables permit an answer to the question: "Which government pays the bills?" Federal, state and local taxes vary in their progressivity-regressivity. A state that relies heavily on locally financed services may generate a different type of response among taxpayers than one that relies on state or federal revenues. It is also likely that each level of government differs in its responsiveness to demands. Thus a state that emphasizes services financed by federal or state agencies may present a different complexion of need-gratifications than one which is localist in orientation. Finally, the supervision of "avoided" programs is likely to differ from that of programs financed locally. A heavy reliance on federal and state revenues, therefore, may have administrative implications that influence other dimensions of state politics.

No two of our political variables measures the same phenomena in exactly the same manner. It is possible, however, that our penchant for a comprehensive list of indicators will overload the factor analysis in favor of phenomena (e.g., party competition) that have been the subject of several earlier measurements. In order to guard against this kind of overloading, we computed a matrix of simple correlation coefficients between all of our political variables. In those cases where variables measuring similar phenomena showed high coefficients of correlation ($r > 7$), we eliminated one of the highly intercorrelated pair from the factor analysis. The 41 variables that survived this first screening process are indicated in Table 1 and were entered into a preliminary factor analysis. This analysis was used to identify those variables which loaded high on two or more factors or loaded high in no factor. (See notes 8 and 9) A second factor analysis was performed without these ambiguities and irrelevancies, and produced the two principal factors reported in Table 2.

The first principal factor is labeled "Professionalism-Local Reliance." It draws its name from the *positively-loaded* measures of judicial and legislative compensation, expenditures on legislative services, and legislative activity; and from the *negatively-loaded* measures of reliance upon *state* government expenditures and *federal* aids. States scoring high on this factor show high salaries for judges and legislators, well-financed legislative staffs, and primary reliance on locally raised and spent revenues. The inverse juxtaposition in factor #1 of professionalism in government and the use of state and federal aids makes sense in terms of functions that intergovernmental payments are reputed to serve. They are often defended as devices that are used most by governments which redistribute resources from *have* to *have not* jurisdictions. And in fact, the recipients have apparent needs for assistance. Factor #1 suggests that states making heavy use of intergovernmental assistance have judicial and legislative institutions that are less well-developed than average.

The second factor—"Competition-Turnout" —has as its highest-loaded variables the measures of turnout in a gubernatorial election, an index of suffrage liberality, and (negatively) one-party dominance in the state legislature and in recent elections for governor.[15] The Competition-Turnout dimension provides some post hoc justification for the many studies of state politics that have focused almost entirely on electoral processes and inter-party struggles. Books and articles by V. O. Key, Duane Lockard, and John Fenton, among others, view party competition and electoral behavior as the primary stuff of politics.[16] Our factor analyses

TABLE 1. POLITICAL VARIABLES SUBJECT TO ANALYSIS†

(Participation and Party)

**1. Percent voting age population voting for Governor
2. Percent voting age population voting for U.S. Representative
**3. Number of items on Milbrath's list of suffrage regulations on which a state scores as a "facilitator"
**4. Percent of gubernatorial vote won by major party
5. Percent of congressional vote won by major party
**6. Percent of seats in lower house of state legislature held by major party
7. Percent of seats in upper house of state legislature held by major party
*8. Number of years during 1952–62 when major party controlled Governor's office
**9. Number of years during 1954–62 when major party controlled lower house of legislature
*10. Number of years during 1954–62 when major party controlled upper house of legislature

(Institutions and Personnel)

*11. Dauer-Kelsay index of legislative apportionment
*12. David-Eisenberg index of legislative apportionment
*13. Shubert-Press index of legislative apportionment
*14. Number of state legislators
**15. Legislators' compensation
**16. Total expenditures on legislative services per legislator (minus compensation)
*17. Number of legislative committees
**18. Number of bills introduced into the legislature
19. Number of bills passed by the legislature
*20. Proportion of bills introduced that were passed
*21. Number of days in the legislative session
*22. Term of judges on state court of last resort
*23. Minimum age requirement for judges on appeals courts
*24. Minimum age requirement for judges on trial courts
**25. Compensation of judges on court of last resort
*26. Minimum term that will make state judges eligible for pension
27. Number of state employees per 10,000 population
28. Average salary of state employees
*29. Percent of state employees covered by state personnel system
*30. Schlesinger index of gubernatorial formal power
*31. Number of separately elected executive officials in the state government
*32. Number of state plus local government employees per 10,000 population
*33. Average salary of state plus local government employees
*34. Percent of state and local government employees covered by government supported health and hospital insurance
*35. Percent of state and local government employees covered by government supported life insurance
36. Number of words in state constitution
*37. Number of amendments in state constitution
*38. Date of state constitution's ratification
*39. Population per local governmental unit

(Fiscal Structure)

*40. Percent of state and local government revenues collected from real property taxes
*41. Percent of state and local government revenues collected from individual income taxes
*42. Percent of state and local government revenues collected from general sales taxes
43. Percent of state and local government revenues collected from excise taxes
*44. Percent of state and local government revenues collected from current service charges
45. Percent of state government revenue received as federal aid
**46. Percent of state and local government revenue received as federal aid
47. Percent of state and local government revenue raised by state government
**48. Percent of state and local government revenue spent by state agencies
49. Percent of state and local government revenue raised by local governments
50. Percent of local revenue received from the state government
*51. Percent of state aid to localities allocated on the basis of fixed criteria of population or the amount of certain taxes collected locally
52. Percent of state aid to localities allocated on the basis of need
*53. State aid to localities per capita

† Unless indicated otherwise, the data pertain to 1962.

TABLE 2. LOADINGS OF POLITICAL VARIABLES ON TWO PRINCIPAL FACTORS

Variables*	Professionalism—Local Reliance	Competition—Turnout
Compensation of judges (25)	.897	.045
Compensation of legislators (15)	.865	.142
Legislative Service expenditures (16)	.821	.025
Number of bills introduced (18)	.812	−.130
State and local revenue from federal government (46)	−.763	−.293
State and local revenue spent by state agencies (48)	−.732	−.330
Lower house seats of major party (6)	−.280	−.861
Gubernatorial election turnout (1)	.033	.827
Gubernatorial vote for major party (4)	−.077	−.775
Liberal suffrage laws (3)	−.006	.717
Lower house tenure of major party (9)	−.061	−.623
Percent of Total Variance	36.7	28.8

* The parenthesized numbers correspond to the variable numbers in Table 1.

suggest that an electoral-party dimension has indeed some importance as a distinct component of state politics.

Public Policy Factors. Our list of policy measures is limited in conception to the expenditures for and outputs of major public services. It is not designed to measure "everything government does." Some measures of government activity seem better conceived as measures of state politics than as measures of policy.[17] In the factor analysis of state public policies, the variables were chosen to represent both current expenditures for major services and approximations of results from service operations.[18] The non-expenditure variables measure "outputs" expressed as service actually rendered. Table 3 lists the variables entered into the factor analyses of policy outputs.

The measures of educational output show the capacity of secondary schools to entice students to remain until graduation and the success of each state's residents on a nation-wide examination. Presumably, the first measure assesses the schools' ability to serve the needs of the students, whether they are inclined toward college preparation or immediate placement in business or the trades. The incidence of examination passes should reflect the quality of information and the intellectual skills that state residents possess by the time they finish secondary school.

The highway output measures record the mileage of various types of state roads in relation to population. Population seems to be the best measure of traffic needs that is readily available.[19] Therefore, the measures show the incidence of various roads in relation to the demands of traffic. Admittedly, road location is not considered. Some states may build many

Politics (Princeton: Princeton University Press, 1959); John H. Fenton, *Politics in the Border States* (New Orleans: Hauser Press, 1957); and Fenton, *Midwest Politics* (New York: Holt, Rinehart and Winston, 1966).

[17] We have described above our justifications for including measures pertaining to government personnel, structure, and revenue among our political variables. In brief, they represent features of revenue inputs and governmental structures that may affect response to citizens' needs and demands. Our policy measures are more narrow in representing the benefits which governments actually provide to their citizens within the prominent categories of service.

[18] Although some research has relied almost exclusively on expenditures as indicators of public policy, a recent study shows the risk in assuming an expenditure-service relationship. The current expenditures of state and local governments may not be uniformly reliable indicators of the service that is actually provided to the population. But on the other hand spending may represent the effort that state and local governments are making in order to improve or maintain their services. Therefore it deserves a place on our list of policy variables. See Sharkansky, "Government Expenditures and Public Services in the American States," this REVIEW, 61 (December, 1967), 1066–1077.

[19] See Philip H. Burch, Jr., *Highway Revenue and Expenditure Policy in the United States* (New Brunswick: Rutgers University Press, 1962), p. 23.

miles of roads but place them unwisely with respect to centers of population, commercial needs, etc. The completion rate of the interstate system provides some indication of state highway department administrative skills and capacity to respond quickly in the face of a major opportunity. The inverted death rate provides a measure of road safety. Where a state scores high on the latter measure, it should indicate high standards of road design and maintenance and/or an adequate system of highway patrol.

Output measures in the public welfare field reflect both the generosity of payments and the coverage of each major public assistance program. These specific programs have been in operation generally for several years. They represent much of the work carried out by state departments of public welfare. However, the indicators do not assess such things as quality or quantity of counselling services, cost of living differences, or activities under the newer programs sponsored by the federal Office of Economic Opportunity.

Measures of health policies assess the likelihood of white and non-white children surviving their first year. Admittedly, these variables cover only a small portion of health-relevant services within each state. And they show the influence of many social and economic processes. Nevertheless, we assume that high scores on these scales reflect the presence of health and hospital facilities that are adequate in the face of cultural and medical needs.

Natural resources policies are reflected in measures of the tendency of state residents to use the programs and facilities offered by state departments of parks and wildlife. High scores on these variables should signal attractive programs. The basic assumption is that an attractive program stimulates usage by state residents.[20]

[20] In collecting the data for the measures of outputs and services, the assumption was made that recorded information is a reasonably accurate reflection of fact. The authors recognize considerable controversy about the reliability of the data. Yet the data chosen appear to be the best available, and they enjoy wide use among social scientists. For comments about each item the reader is referred to the sources. The sources for the political variables include: *Census of Governments, 1962: The Book of the States 1964–1965; Statistical Abstract of the United States, 1964;* the index of gubernatorial power comes from Schlesinger's article cited in note #12; the index of suffrage regulations comes from Lester Milbrath, "Political Participation in the States," in Jacob and Vines, *op. cit.*, pp. 25–60; the indices of legis-

† The data all pertain to 1962.

* Variables surviving test for high loading on a single factor.

Examination of the simple correlations among the policy measures revealed no redundancies comparable to those found in the list of political variables. A preliminary factor analysis of the policy variables led us to eliminate ambiguities and irrelevancies which loaded high on two factors or on no factors. (See notes 8 and 9). Then a second factor analysis was performed with the remaining variables. The variables retained and their loadings are shown in Table 4. The first factor—"Welfare-Education"—emphasizes generous welfare payments, the tendency of high school pupils to remain until graduation, and the success of state residents on the national examination.

The second principal policy factor is "Highway-Natural Resources." Its major components are measures of rural highway mileage and highway expenditures, plus measures of fish and wildlife services and expenditures for natural resources. A curious variable that is loaded highly on this factor is Old Age Assistance recipients. At first glance, it seems out of its proper place in the Welfare-Education factor. Aid to the aged, however, is the product of a policy process that is distinct from that of other welfare and education programs. A number of rural states that have paid little attention to the average level of welfare benefits have shown considerable concern for their aged and have made the program available to a large number of beneficiaries. Some of this concern may be related to the political strategy of state governmental decision makers. Aside from welfare mothers (who are tainted with a stigma of illegitimacy), the aged are the largest groups of potential welfare recipients who are eligible to vote.[21] The lines of reasoning suggested by this instance will be more carefully explored in Section III below.

Socioeconomic Factors. The factor analysis of socioeconomic characteristics is discussed in detail elsewhere.[22] It includes measures of income, urbanization, industrialization, ethnicity, education and other likely components of "economic development." The variables included are listed in Table 5 in the order in which they load on two principal factors. The factors are here labelled "Industrialization" and "Affluence" ac-

lative apportionment comes from Paul T. David and Ralph Eisenberg, *Devaluation of the Urban and Suburban Vote* (Charlottesville: Bureau of Public Administration, University of Virginia, 1961), p. 5, 15, and Glendon Shubert and Charles Press, "Measuring Malapportionment," this REVIEW, 58 (1964), 969. cording to the variables that load highest on each one.[23] In this article, these factors are used to assess the socioeconomic conditions that support various aspects of state politics and public service and to test the interaction between the major dimensions of state economics, politics, and policy.

III. ECONOMIC-POLITICAL-POLICY RELATIONSHIPS: A COMPARISON OF FACTOR VERSUS INDIVIDUAL VARIABLE RELATIONSHIPS

One controversy that is clarified by the use of factor scores concerns relationships among political and economic characteristics of the states that are alleged to influence the nature of public policies. Several publications employ individual variables to answer the question raised in our introduction, i.e., how do political and economic elements relate with each other and with the nature of public policies? Although most authors use comparable measurements and attempt to make their research additive with respect to each others', the interpretation of their findings is made difficult by the discreteness of the variables examined. The correlations reported by Dye, for example, often show differing policy relationships with "industrialization" and "urbanization" than with "income" and "education."[24] The findings claimed when the "political" measures assess a certain type of voter turnout or party competition differ from the findings derived from "political" measures that assess the equity of apportionment or the centralization of state-local financial relationships. Likewise, findings vary with the use of expenditures or other

[23] *Ibid.* The label given to one of the socioeconomic factors is new with this article. In the original article "Affluence" was labelled "Cultural Enrichment," the present term seems more appropriate as a description of the contents of this factor.

[24] See, for example, Dye, *op. cit.*, p. 125 and p. 162.

TABLE 6. FACTOR SCORES FOR THE STATES ON TWO POLITICAL AND TWO POLICY FACTORS

variables that purport to measure public policy.[25]

At this point it is possible to face the issue of political or economic influences on public policies with some important new tools. The six factors measure prominent dimensions of state economics, politics, and public policies. They should enable us to see which types of economic and political phenomena are most relevant for which types of public policy. The statistics employed in this section are commonly used in the analysis of policy determinants: coefficients of simple, partial, and multiple correlation. The innovation here is in the variables. Instead of individual measures, the variables are represented by the factor scores reported in Table 6.

There is a strong association between Competition-Turnout and the Affluence dimension of state economics. (See Table 7.) Evidently, citizens are more likely to participate in politics and parties are most likely to compete with one another where the residents are well-educated and relatively wealthy. Of course, this finding is not new. However, it is a very important relationship in the political and economic systems of American states that is highlighted by the use of factor analysis.[26]

Another strong relationship is that between the Professionalism-Local Reliance dimension of

TABLE 7. COEFFICIENTS OF SIMPLE CORRELATION BETWEEN SOCIOECONOMIC AND POLITICAL FACTORS

Political Factors	Socioeconomic Factors	
	Industrialization	Affluence
Professionalism—Local Reliance	.73	.14
Competition-Turnout	.11	.66

[25] See Sharkansky, *Spending in the American States*, Chapters 4 and 7.

[26] The strength of relationships between the political and economic factors is stronger than that customarily obtained with individual variables. The correlations that we have described are .73 and .66. Only two out of the forty-eight simple correlations between economic and political variables that Dye reports in his study reach the level of .66 and none reach .73 (see his Chapter 3). The underlying dimensions that are tapped by factor analysis appear to be more salient representations of the economic-political nexus than are apparent in studies using single variables.

state politics and the Industrialization dimension of state economics. It is apparently the value of industrial output and the incidence of industrial employment—instead of education, wealth, or ethnicity—that has the most to do with the development of legislative and judicial professionalization and the tendency of local authorities to rely on their own economic resources. It may be that a large industrial tax base and an urbanized population permits governments to rely on locally-raised revenues. An industrial economy may also encourage states to develop professional, active policy making institutions in response to comparable models in the private sector.

The Welfare-Education dimension of state policy shows positive relationships with each of the political and economic factors. (See Table 8.) The coefficients of partial correlation reveal that this policy factor is associated most closely with high scores on Competition-Turnout and Affluence, with neither being significantly more important than the other. The elements of interparty competition, high voter participation, high levels of educational attainment, and wealth seem to provide the impetus—independently from other governmental and economic conditions—for public officials to provide generous welfare payments and successful educational services.[27]

[27] The political and economic factors are more successful in accounting for interstate variance in the policy factors than are most individual measures of these phenomena. Table 8 shows simple, partial, and multiple correlation coefficients between policy factors as dependent variables and the political and economic factors as independent variables. It shows that both political factors together account for 61 and 36 percent of the variance in the policy factors. In contrast, the multiple correlation coefficients that Dye reports show that his collection of individual political variables account for 36 percent of the variance in only fifteeen out of fifty-four dependent variables, and they account for 61 percent of the variance in only two out of the fifty-four instances. (See Dye, *op. cit.*, pp. 286–287.) Both of our socioeconomic factors account for 59 and 68 percent of the variance in the policy factors. In contrast, Dye's collection of individual social and economic variables account for 59 percent of the variance in only fourteen of fifty-four dependent variables, and they account for 68 percent of the variance in only eight of fifty-four dependent variables. A similar finding appears when we compare with his data the success of our economic and political factors together in explaining variance in our policy factors. We explain 69 and 70 percent of the variance in the policy factors by means of all political and socioeconomic variables: variables Dye explains 69 percent of the variance for only thirteen of fifty-four dependent variables,

TABLE 8. COEFFICIENTS OF SIMPLE, PARTIAL, AND MULTIPLE CORRELATION, AND MULTIPLE DETERMINATION BETWEEN SOCIOECONOMIC, POLITICAL, AND POLICY FACTORS

	Simple Correlation		Partial Correlation*	
	Welfare—Education	Highways—Natural Resources	Welfare—Education	Highways—Natural Resources

* Controlling for the other factors.

This finding of importance for the Competition-Turnout factor with respect to welfare and education services provides some latter-day support for hypotheses derived from Key and others that electoral and party characteristics of state politics have something to do with the nature of services that are provided.[28] Our findings do not, however, fit the neat, linear, single determinant structure of causality suggested by some of Key's followers. Rather, the data suggest that it is not any one element of state politics, but an underlying factor that is only partly measured by individual variables which exerts an independent influence on public services. The prominence of this finding is increased by the importance of the policy factor involved. Welfare and education services consume a substantial proportion of state and local government resources: 49 percent of general expenditures and 51 percent of government employment in 1965–66. Policy making in welfare and education are characterized by sharp controversies; this may explain their relation with electoral and partisan processes in a manner quite different from other areas of public policy.

The Highway-Natural Resources dimension of public policy shows its primary dependence

[28] See their works cited in note #16, *supra*.

on economic factors. It is inversely and strongly related to Industrialization and directly related to Affluence. Thus it appears that *low* levels of industrial output and employment, population density and urbanization together with *high* levels of personal wealth and education incline a state toward heavy investments in roads (especially in rural areas) and active fish and wildlife programs. Wide-open spaces present an abundance of recreational opportunities, the need for highway facilities, and the rural interests that have concentrated their political efforts in behalf of these services. Highway-Natural Resource policy also is inversely dependent on the Professionalism-Local Reliance dimension of state politics, but this is secondary to its dependence on socioeconomic characteristics.

Why the lack of dependence on political factors for highway and natural resource policies? Despite conflicting interests, the particular programmatic activities involved in these policies do not fall neatly along the symbolic continua which are most commonly the objects of partisan controversy. There seem to be few issues, for example, which array taxpayers and the economic *haves* against recipients of services and the *have nots* (in contrast to the case in education and welfare). This may be a function of highways, parks, wildlife, and conservation programs being "self-financed" by means of earmarked taxes, licenses and user fees. The recipients pay for much of the benefits received, and do not generate a great deal of conflict across the lines of different social classes or ethnic groups.

IV. SUMMARY AND CONCLUSIONS

This article reports two separate factor analyses of state politics and public policies. And together with two socioeconomic factors, it employs the political and policy factors to clarify relationships among three sectors of a widely used model of the state policy process. The major findings are:

1) The factor analysis of political variables reveals two underlying dimensions of state politics. These are Professionalism-Local Reliance and Competition-Turnout. The distinctiveness of the Competition-Turnout factor testifies to the importance of this dimension in distinguishing the politics of each state from the others. And it credits the perception of Key, Lockard, Fenton and other political scientists who took aspects of electoral and party behavior as the focus of their own work.
2) The factor analysis of policy variables reveals two principal dimensions of Welfare-Education and Highway-Natural Resources.
3) The examination of political and economic factors shows strong associations between Competition-Turnout and Affluence, and between Professionalism-Local Reliance and Industrialization.
4) The relationships among political, economic, and policy factors show that the Welfare-Education dimension of state policy is significantly dependent upon the Competition-Turnout dimension of state politics and the Affluence dimension of the state economy. Where a state is wealthy and shows high turnout and intense interparty competition, it is likely to score high on the level of welfare and educational services. The Highway-Natural Resources dimension of policy appears most dependent upon the Industrialization dimension of the states' economies. The relationship is inverse, indicating that well-developed highways and fish-game programs accompany low levels of industrialization and population concentration.
5) The relationships among economic, political, and policy factors are generally stronger than the relationships between individual variables that have previously been used. Thus the underlying dimensions tapped by factor analysis strengthen as well as simplify our explanations of policy making in the American states.

The single most important finding of this article may be its emphasis upon multidimensionality in state economics, politics and public policy. There is no single answer to the question: "Is it politics or economics that has the greatest impact on public policy?" The answer (contrary to the thrust of much recent research) varies with the dimensions of each phenomena that are at issue.[29] Welfare-Education policies relate most closely with the Competition-Turnout dimension of state politics *and* with the Affluence dimension of the economy. Highway-Natural Resource policies show their closest (inverse) relationships with the Industrialization dimension of the state economy.[30]

[29] Charles F. Cnudde and Donald J. McCrone "Party Competition and Welfare Policies in the American States, this REVIEW, 63 (September 1969).

[30] One limitation of the data employed throughout this article is their lack of historical perspective. A separate study of the two socioeconomic factors and their relationship with individual policy

While these findings add to the inquiry into political and economic determinants of public policies, they offer little encouragement to those who would seek to expand the level and scope of public services by manipulating one political or structural characteristic of state government (e.g., voter turnout, party competition, or apportionment). It is apparent only that certain aspects of politics having to do with voter turnout and interparty competition are related to certain public policies. But this does not terminate the inquiry. Factor analyses depend on the nature of the variables included in them. Although this study has included a wide range of political, economic, and policy variables in its factor analyses, it is likely that further analysis —with more measures of political, economic, and policy traits—will permit the extraction of additional dimensions from the sectors of state policy systems.

The present factors leave unexplained much of the variance in state politics and policy.[31] This unplumbed variance might be reduced by adding more variables to the factor programs. However, it may be inherent in the nature of the phenomena that much variance will remain unexplained by factor analysis. This unexplained variance may reflect the importance of particularistic, unpatterned happenings that fashion and lend excitement to political institutions. The effort to explain why politics and policies differ from one state to the next may be helped considerably by examining the dimensions lying beneath readily measured variables. But no amount of archival search and factor analysis will account for the contributions made to the institutions of policies of individual states by dynamic personalities or the force of strong traditions. The study of elite and organizational behavior, plus exploration of the values that prevail in the cultural environments of the individual states may be essential for a thorough understanding of inter-state differences in politics and public policy.

---

and electoral variables has shown that the strength of relationship is, in some cases, quite fluid over time. (See Hofferbert, "Socioeconomic Dimensions . . . ," *op. cit.*) This fluidity, however, may be a result of simple changes in the value of isolated dependent variables and not an accurate picture of the more analytically interesting dimensions of policy and political life which we have been considering here. Hofferbert found that the relative contribution of individual variables maintained a high degree of consistency in their loadings on the principal factors from one decade to the next, although individual variable-by-variable correlations shifted considerably. If it were possible to analyze the full component of political and service variables over extended time, the same type of configuration could probably be expected. Consequently, the strength of relationship of *factors* could be fairly constant over time even though the individual variable correlations changed considerably. Because of limited availability of the political and policy data for previous years, however, this must remain a matter for speculation.

For a useful discussion of the methodological problems of theory construction employing measures standardized for a specific population and time, such as the correlation coefficients used here, versus unstandardized regression coefficients see Hubert Blalock "Causal Inferences, Closed Populations, and Measures of Association," this REVIEW, 61 (March, 1967), 130–136. Blalock argues that in building theoretical statements of more general application, the regression is the most use since it is not as sensitive as the correlation coefficient to specific population values at a given time. However, in an investigation such as ours, where possibility of longitudinal analysis is limited due to the availability of relevant data, it seemed advisable to retain the greater precision of standardized measures. Furthermore, in the case of the states, the relative magnitudes of most of the variables is not particularly fluid as might be the case with some other types of indicators, such as the congressional roll call votes discovered by Blalock.

[31] Although the figures in Table 2 report that the political factors account for 66 percent of the variance, this pertains to the variance in the eleven variables that were subject to this factor analysis. These factors do not account for this much of the variance in the total collection of fifty-three variables that are presented in Table 1.

THE DIFFUSION OF INNOVATIONS AMONG THE AMERICAN STATES*

JACK L. WALKER
University of Michigan

We are now in the midst of a notable revival of interest in the politics of the American states. During the last decade many studies have been conducted of the social, political and economic determinants of state policy outcomes.[1] Several of these writers have argued that the relative wealth of a state, its degree of industrialization, and other measures of social and economic development are more important in explaining its level of expenditures than such political factors as the form of legislative apportionment, the amount of party competition, or the degree of voter participation.[2] It has been claimed that such factors as the level of personal income or the size of the urban population are responsible *both* for the degree of participation and party competition in a state, *and* the nature of the system's policy outputs. By making this argument these writers have called into question the concepts of representation and theories of party and group conflict which, in one form or another, are the foundations for much of American political science.[3]

There is a growing awareness, however, that levels of expenditure alone are not an adequate measure of public policy outcomes. Sharkansky has shown, for example, that levels of expenditure and levels of actual service are seldom correlated; presumably, some states are able to reach given service levels with much less expenditure than others.[4] Besides establishing the appropriate level of expenditure for a program, policy makers must also decide about the program's relative scope, provisions for appeal from administrative orders, eligibility requirements, the composition of regulatory boards and commissions, and many other matters which have little to do with money. Before we can evaluate the relative importance of structural and political factors as determinants of policy, therefore, we need to investigate decisions outside the budgetary process. In order to advance that object this study will focus on one of the most fundamental policy decisions of all: whether to initiate a program in the first place.

States have traditionally been judged according to the relative speed with which they have

* Thanks are due to the Committee on Governmental and Legal Processes of the Social Science Research Council, the Carnegie Corporation, the Michigan Legislative Intern Program, and the Rackham Faculty Research Fund of the University of Michigan for grants which made this study possible; to Mrs. Adarsh Trehan, Doyle Buckwalter, Michael Traugott, Mrs. Jennifer Drew Campbell, and Terry Bender who assisted in the collection and analysis of the data; and to H. Douglas Price, Rufus Browning, Warren Miller, Lawrence Mohr, Robert Friedman, Joel Aberbach, Robert Putnam, Ronald Brunner, Dennis Riley, Gail MacColl, and my wife, Linda Walker, whose criticisms and comments have helped me avoid several errors of inference and judgment.

[1] Beginning with Richard E. Dawson and James A. Robinson, "Inter-Party Competition, Economic Variables, and Welfare Policies in the American States," *Journal of Politics* (May, 1963), 265–289, there have been numerous articles and books on the subject. The most recent summary is: John H. Fenton and Donald W. Chamberlayne, "The Literature Dealing with the Relationships Between Political Processes, Socio-economic Conditions and Public Policies in the American States: A Bibliographical Essay," *Polity* (Spring, 1969), 388–394.

[2] For examples see: Herbert Jacob, "The Consequences of Malapportionment: A Note of Caution," *Social Forces* (1964), 260–266; the chapters by Robert Salisbury, Robert Friedman, Thomas Dye, and Dawson and Robinson in: Herbert Jacob and Kenneth Vines (eds.), *Politics in the American States: A Comparative Analysis* (Boston, 1965); Richard I. Hofferbert, "The Relation Between Public Policy and Some Structural and Environmental Variables in the American States," this REVIEW (March, 1966), 73–82; and Thomas Dye, *Politics, Economics and the Public: Policy Outcomes in the American States* (Chicago, 1966)

[3] For an evaluation of the significance of this literature and its implications for political science see: Robert Salisbury, "The Analysis of Public Policy: A Search for Theories and Roles," in Austin Ranney (ed.), *Political Science and Public Policy* (Chicago, 1968), pp. 151–178.

[4] Ira Sharkansky, "Government Expenditures and Public Services in the American States," this REVIEW (1967), 1066–1077. Sharkansky also identifies important political variables in his: "Economic and Political Correlates of State Government Expenditures: General Tendencies and Deviant Cases," *Midwest Journal of Political Science* (1967), 173–192.

accepted new ideas. Wisconsin, because of its leadership during the Progressive period and its early adoption of the direct primary, the legislative reference bureau, and workmen's compensation, gained a reputation as a pioneering state which it has never lost. Reputations of this kind are usually based only on random impressions and they may be inaccurate or misleading, but if it is true that some states change more readily than others a study of the way states adopt new ideas might lead to some important insights into the whole process of political change and development.

This essay is primarily an exercise in theory building. My aim is to develop propositions which might be used as guides to the study of the diffusion of innovations and which might also apply to budgeting and other forms of decision making.[5] Limitations in the data I have collected do not allow empirical testing of all the explanations I propose; the currently untestable propositions are presented in the hope that they may help in preparing the ground for future research. The study begins with an effort to devise a measure of the relative speed with which states adopt new programs. Once a measure of this phenomenon is created efforts are made to discover its principal demographic and political correlates. The article concludes with an effort to devise an explanation for the adoption of innovations based on insights gathered from studies of decision making, reference group theory, and the diffusion of innovations. The major questions being investigated are: (1) why do some states act as pioneers by adopting new programs more readily than others, and once innovations have been adopted by a few pioneers, (2) how do these new forms of service or regulation spread among the American states?

I. DEFINITIONS AND DISTINCTIONS

Several terms have already been used here which have ambiguous meanings and it is important to make clear just how they are to be defined. The most important, and potentially misleading, is the term "innovation." An innovation will be defined simply as a program or policy which is new to the states adopting it, no matter how old the program may be or how many other states may have adopted it. Even though bureaucratic innovations or new departures by regulatory commissions or courts may be mentioned in the course of the discussion, the data used to measure the relative speed of adoption of innovations consists exclusively of legislative actions, simply because the data was readily available only in that form.

We are studying the relative speed and the spatial patterns of *adoption* of new programs, not their invention or creation. Invention, or bringing into being workable, relevant solutions to pressing problems, is an important activity and has been the subject of fascinating research.[6] We will concentrate on the way in which organizations select from proposed solutions the one which seems most suited to their needs, and how the organizations come to hear about these new ideas in the first place.[7] We are not trying to specify the circumstances under which new ideas or programs will be conceived or developed; we are studying instead the conditions under which state decision makers are most likely to adopt a new program.

The object of this analysis is the process of diffusion of ideas for new services or programs. Sometimes new legislation is virtually copied from other states. The California fair trade law, adopted in 1931, "was followed either verbatim or with minor variations by twenty states; in fact, ten states copied two serious typographical errors in the original California law."[8] No as-

[5] There is a well established body of research on the diffusion of innovations from which I have drawn many insights. For general reviews of this literature see: Everett M. Rogers, *Diffusion of Innovations* (New York, 1962), Elihu Katz, Martin L. Levin, and Herbert Hamilton, "Traditions of Research in the Diffusion of Innovations," *American Sociological Review* (1963), 237–252. For early attempts to study the American states from this perspective see: Ada J. Davis, "The Evolution of the Institution of Mothers' Pensions in the United States," *American Journal of Sociology* (1930), 573–582; Edgar C. McVoy, "Patterns of Diffusion in the United States," *American Sociological Review* (1940), 219–227; and E. H. Sutherland, "The Diffusion of Sexual Psychopath Laws," *American Journal of Sociology* (1950–51), 144–156. Also see: Torsten Hagerstrand, *Innovation Diffusion as a Spatial Process* (Chicago, 1967); and Robert Mason and Albert N. Halter, "The Application of a System of Simultaneous Equations to an Innovation Diffusion Model," *Social Forces* (1968), 182–193.

[6] For examples see: Gary A. Steiner (ed.), *The Creative Organization* (Chicago, 1965); and Tom Burns and G. M. Stalker, *The Management of Innovation* (London, 1961).

[7] There is much confusion over this distinction in the literature on diffusion. For an excellent discussion of the problem see: Lawrence B. Mohr, "Determinants of Innovation in Organizations," this REVIEW (1969), 111–126.

[8] Once the mistake was discovered, the Arkansas statute, which reproduced a model prepared by the National Association of Retail Druggists, was

sumption is being made, however, that the programs enacted in each state are always exactly alike or that new legislation is written in exactly the same way by every legislature. It is unlikely that the highway department established in Wisconsin in 1907 had the same organizational format as the one adopted by Wyoming in 1917, or that the council on the performing arts created in New York in 1960 bears an exact resemblance to the one created by Kentucky in 1966. In each case, however, a commitment was made to offer a new service, establish a new principle of regulation, or create an agency which had never existed before. Our concern is the origin and spread of the idea to provide public subsidies for the arts, not the detailed characteristics of institutions created in each state to implement the policy.

No ideological bias was employed in selecting issues for study. The patterns of diffusion for each issue have been treated equally, and no effort was made to develop any method of determining the relative importance or desirability of the programs.[9] Programs are sometimes enacted only to provide symbolic rewards to groups within the population and once created are left with inadequate funds or otherwise disabled.[10] Oklahoma's legislature, for example, emulated other states by creating a state civil rights commission, but once the commission was established, only $2,500 was appropriated for its operation.[11] For the purposes of this study, however, all adoptions are equal. My goal is to provide an explanation of the relative speed of adoption and the patterns of diffusion of innovations; I am not interested in the effectiveness of Oklahoma's civil rights commission, but in where the legislature got the idea to create such a commission and why it acted when it did.

II. THE INNOVATION SCORE

My first aim is to explain why some states adopt innovations more readily than others. I assume that the pioneering states gain their reputations because of the speed with which they accept new programs. The study must begin, therefore, with an attempt to devise an innovation score that will represent the relative speed with which states adopt innovations.

The innovation score is based on the analysis of eighty-eight different programs (see the Appendix for a list) which were enacted by at least twenty state legislatures prior to 1965, and for which there was reliable information on the dates of adoption. In order to make the collection of programs as comprehensive and representative as possible, I adopted a list of basic issue areas similar to the one employed by the Council of State Governments in its bi-annual reports included in the *Book of the States*. I tried to study six to eight different pieces of legislation in each of these areas: welfare, health, education, conservation, planning, administrative organization, highways, civil rights, corrections and police, labor, taxes, and professional regulation. In the course of my analysis I studied issues ranging from the establishment of highway departments and the enactment of civil rights bills to the creation of state councils on the performing arts and the passage of sexual psychopath laws. Most of the programs were adopted during the twentith century, but sixteen of them diffused primarily during the latter half of the nineteenth century.

Once the eighty-eight lists of dates of adoption were collected they were used to create an innovation score for each state. The first step was to count the total number of years which elapsed between the first and last recorded legislative enactment of a program. Each state then received a number for each list which corresponded to the percentage of time which elapsed between the first adoption and its own acceptance of the program. For example, if the total time elapsing between the first and last adoption of a program was twenty years, and Massachusetts enacted the program ten years after the first adoption, then Massachusetts received a score of .500 on that particular issue. The first state to adopt the program received a score of .000 and the last state received a 1.000. In cases in which all the states have not yet adopted a program, the states without the program were placed last and given a score of 1.000.[12] The in-

copied either verbatim or with minor changes by seventeen states. Ewald T. Grether, *Price Control Under Fair Trade Legislation* (New York, 1937), pp. 19–20.

[9] In later work I will report the results of comparisons of the diffusion patterns of issues from different subject matter areas. Preliminary efforts at such comparisons, however, have not revealed significant variations. There does not seem to be much difference in the diffusion patterns of issues of different types.

[10] For a discussion of this phenomenon see: Murray Edelman, *The Symbolic Uses of Politics* (Urbana, 1964), chapters 2 and 9.

[11] Duane Lockard, *Toward Equal Opportunity* (New York, 1968), p. 23.

[12] The beginning point for the existence of each state was the date upon which it was officially organized as a territory. Using this system, Oklahoma is the last state to come into being, having been organized in 1890. If a program began its diffusion before a state came into existence, tha

novation score for each state is simply 1.000 minus the average of the sum of the state's scores on all issues. The larger the innovation score, therefore, the faster the state has been, on the average, in responding to new ideas or policies. The issues may be divided into groups according to subject matter areas or time periods, and separate scores can be created for these smaller groupings of issues by following the same procedure. The results of this scoring procedure, using all eighty-eight issues, are presented in Table 1.

A note of caution should be sounded before the results of this exercise are analyzed. We are endeavoring to measure a highly complex process in which an enormous number of idiosyncratic influences are at work; an official with an unusually keen interest in a particular program, a chance reading of an article or book by a governor's aide, or any number of other circumstances peculiar to any one issue might lead to the rapid adoption of a piece of legislation by a state which is usually reluctant to accept new programs. Mississippi, which has the lowest average score and ranks last among the states in relative speed of adoption, was nonetheless the first state to adopt a general sales tax.

If this reservation is kept in mind, the data in Table I provide a crude outline of the standard or typical pattern of diffusion of new programs or policies among the American states. The states at the top of the list tend to adopt new programs much more rapidly than those at the bottom of the list. Having provided a preliminary measurement of this phenomenon, we must now try to explain it. Why should New York, California and Michigan adopt innovations more rapidly than Mississippi, Wyoming and South Dakota?

III. THE CORRELATES OF INNOVATION

Demographic Factors: After studying the acceptance of technological innovations by both individuals and organizations, several writers have concluded that the decision maker's relative wealth, or the degree to which "free floating" resources are available, are important determinants of the willingness to adopt new techniques or policies.[14] If "slack" resources are available, either in the form of money or a highly skilled, professional staff, the decision maker can afford the luxury of experiment and can more easily risk the possibility of failure.[15] Other studies, especially in the areas of agriculture and medicine, have also shown organizational size to be a strong correlate of innovation.[16] Given these results from prior studies in other fields we might expect to find

issue was not included in figuring the innovation score for the state.

[13] Alaska and Hawaii were omitted from the analysis because data for their years of adoption were often missing.

[14] Everett M. Rogers, *Diffusion of Innovations* (New York, 1962), pp. 40, 285–292. Also see: S. N. Eisenstadt, *The Political Systems of Empires* (New York, 1963), p. 27, 33–112.

that the larger, wealthier states, those with the most developed industrial economies and the largest cities, would have the highest innovation scores. It would seem likely that the great cosmopolitan centers in the country, the places where most of the society's creative resources are concentrated, would be the most adaptive and sympathetic to change, and thus the first to adopt new programs.

In order to test these assumptions several measures of social and economic development were correlated with the innovation score. As we can see in Table 2, there is evidence that the larger, wealthier, more industrialized states adopt new programs somewhat more rapidly than their smaller, less well-developed neighbors. Fairly strong relationships exist between the innovation score and the value added by manufacturing, the average per acre value of farms, the size of the urban population, and the average per capita income. These relationships remain virtually unchanged in all time periods. In fact, the only relationship which changes substantially over time is that between innovation and the percentage of illiterates in the population which declines steadily across the three time periods. This declining relationship and the low correlation between innovation and the median school year completed is caused primarily by the states in the Rocky Mountain region which have the highest rankings on median school years completed and yet are among the slowest to adopt new programs.[17] The median of educational attainment in the states with the highest innovation scores is pulled down by the presence of a large, poorly educated, lower class, living primarily in the inner cities. The highly industrialized states with large urban concentrations are characterized by great inequality of social status and attainment. It would seem, however, that the elements necessary to foster innovation are present in these states even though they do not have highest average level of educational achievement.

Political Factors: Although students of policy

TABLE 2. CORRELATIONS BETWEEN INNOVATION SCORES AND FIVE SOCIAL AND ECONOMIC VARIABLES, BY TIME PERIODS

Social-Economic Variables	Innovation Scores*			Composite Score
	1870–1899	1900–1929	1930–1966	
Per Cent Population Urban:	.62**	.69	.62	.63
Total Population:	.52	.40	.50	.59
Average Income, Per Capita:	—***	.62	.50	.55
Value Added Per Capita by Manufacturing	.46	.55	.57	.66
Average Value, Per Acre, of Farms:	.70	.52	.52	.54
Per Cent Population Illiterate:	−.58	−.44	−.12	−.23
Median School Years Completed:	—***	—***	.24	.26

* In order to insure that the innovation score and the social and economic variables came from comparable periods, separate innovation scores were calculated for three time periods: 1870–1899, 1900–1929, and 1930-1966. In constructing this table each innovation was placed in the time period during which the first ten states adopted it. Thus, if a program was adopted by only four states during the 1890's, and completed its diffusion during the 1900's, the program is placed in the second time period: 1900–1929, even though its first adoptions took place during the nineteenth century. Social and economic data are taken from the years 1900, 1930, and 1960. The composite score is correlated with social and economic data from 1960.

** The table entries are Pearson product-moment correlations.

pret, but will be treated more fully in later work. For an example of this problem discussed in another context see: Raymond Wolfinger and John Osgood Field, "Political Ethos and the Structure of City Government," this REVIEW (1966), 306–326. For a more extensive discussion of the methodological implications see the discussion of "interaction effects" in Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," this REVIEW (1968), pp. 1261–1262; and the communication from Dennis D. Riley and Jack L. Walker, this REVIEW (September, 1969), pp. 880–899.

erties: A Comparative Analysis," *American Journal of Sociology* (1967), 516–517; and Richard J. Hall, S. Eugene Haas, and Norman J. Johnson, "Organizational Size, Complexity and Formalization," *American Sociological Review* (1967), 903–912.

[17] Regional affects of this kind appear frequently in analyses of data from the American states. In many studies, especially those which involve measures of political participation or party competition, strong relationships appear which are actually only a result of the distinctive nature of the southern states. In order to insure that the correlations in this analysis were not merely a result of the social and political peculiarities of the South, the eleven states of the confederacy were removed from all distributions. Since the Southern states do not cluster at one extreme of the innovation scale, no great changes occurred in correlation coefficients based upon data from the thirty-nine states outside the South. Within the eleven Southern states, however, almost all the relationships were substantially reduced in size. Because only eleven states are involved, this fact is difficult to inter-

making have begun to doubt the importance of the political system as an independent determinant of the behavior of decision makers, it seems likely that both the degree of party competition and a state's system of legislative apportionment would affect its readiness to accept change. It would seem that parties which often faced closely contested elections would try to out-do each other by embracing the newest, most progressive programs and this would naturally encourage the rapid adoption of innovations. Lowi argues that new departures in policy are more likely at the beginning of a new administration, especially when a former minority party gains control of the government.[18] If this tendency exists it would also seem likely that state political systems which allow frequent turnover and offer the most opportunities to capture high office would more often develop the circumstances in which new programs might be adopted.[19]

Another prerequisite for the rapid adoption of new programs might be a system of legislative apportionment which fully represented the state's urban areas and which did not grant veto power to groups opposed to change. Such a system might be expected to allow consideration and debate of new policies and programs in all areas. Some recent findings, such as Barber's study of legislators in Connecticut,[20] lead us to speculate that representatives from newly developing urban and suburban areas would be more cosmopolitan, better informed, and more tolerant of change. If nothing else, urban legislators would probably be more willing to deal with problems of sanitation, planning, transportation, and housing peculiar to large metropolitan areas.

TABLE 3. CORRELATIONS BETWEEN INNOVATION SCORES AND MEASURES OF POLITICAL VARIABLES, BY TIME PERIODS

Political Variables*	Innovation Scores			Composite Score
	1870–1899	1900–1929	1930–1966	
Party Competition for Governorship:	.36	.02	.14	.24
David-Eisenberg Index of Malapportionment:	**	.07	.55	.65

* The Index of party competition used in this table is the per cent of the total vote going to the gubernatorial candidate coming in second, times 2. This yields a scale from 0 to 100. It was created by Richard Hofferbert. The apportionment Index appears in Paul T. David and Ralph Eisenberg, *Devaluation of the Urban and Suburban Vote* (Charlottesville: Bureau of Public Administration, University of Virginia, 1961).

** Measures of this phenomenon corresponding with this time period do not exist.

No matter what the composition of the legislator's constituency, however, it would seem that the presence of competent staff, superior clerical facilities, and supporting services would allow him to give serious consideration to a larger number of new proposals. Several studies of the diffusion of technological innovations have demonstrated that the best informed individuals are most likely to pioneer in the use of new techniques or tools,[21] and so the states which provide the most extensive staff and research facilities in their legislatures ought to pioneer in the adoption of new programs.[22]

In Table 3 efforts to test some of these hypotheses in different time periods are displayed. Measures of political variables are usually based on evidence only from contemporary periods because data are seldom available on state and local elections or the operation of legislatures in earlier decades. Measures are available, however, for the degree of party competition and the ex-

[18] Theodore Lowi, "Toward Functionalism in Political Science: The Case of Innovation in Party Systems," this REVIEW (1963), 570–583. Evidence which seems to confirm Lowi's theory may be found in: Charles W. Wiggens, "Party Politics in the Iowa Legislature," *Midwest Journal of Political Science* (1967), 60–69; and Frank M. Bryan, "The Metamorphosis of a Rural Legislature," *Polity* (1968), 191–212.

[19] Joseph A. Schlesinger has developed an index of the "general opportunity level" in each state. The index measures the relative number of chances which exist in each state to achieve major political office. See: *Ambition and Politics: Political Careers in the United States* (Chicago, 1966), pp. 37–56.

tent of legislative malapportionment.[23] As we can see in Table 3 party competitiveness does not seem to be consistently related to the innovation score, at least as it is measured here.[24] Legislative apportionment is not correlated with the innovation score in the 1900–1929 period, but is related in the 1930–1966 period. Since legislatures steadily became less representative of urban populations after 1930, it may be that we have here some empirical evidence of the impact of malapportionment on policy making in the states.

Recent studies of state expenditures have shown that the explanatory effects of political variables could be eliminated if statistical controls for social and economic variables were applied. Therefore, in Table 4 I have presented both the zero-order correlations of the composite innovation score with measures of party competition, turnover in office, legislative apportionment, and legislative professionalism,[25] and

[23] There is one other index in existence which deals with political phenomenon: Rodney Mott's Index of Judicial Prestige. The Mott index measures the degree to which state supreme courts were used as models by the legal profession. It is based on a study of citations in federal Supreme Court decisions and all state supreme court decisions, the number of cases reprinted in standard textbooks, and the opinion of a panel of prominent legal scholars; it covers the period 1900 to 1930. The Mott index and the innovation score from the same time period are correlated at .62. This finding might be interpreted to mean that emulative behavior in the judicial arena is not much different from that in the legislative arena. For details of the Judicial Prestige Index see: Rodney L. Mott, "Judicial Influence," this REVIEW (1936), 295–315.

[24] Data for this table was derived from Richard Hofferbert's collection, "American State Socioeconomic, Electoral, and Policy Data: 1890–1960" which he has graciously allowed me to use.

[25] The sources are: Richard Hofferbert, "Classification of American State Party Systems," *Journal of Politics* (1964), 550–567; Dennis Riley and Jack L. Walker, "Problems of Measurement and Inference in the Study of the American States" (Paper delivered at the Institute of Public Policy Studies, University of Michigan, 1968); David and Eisenberg, *op. cit.;* Glendon Shubert and Charles Press, "Measuring Malapportionment," this REVIEW (1964), 302–327, and corrections, 968–970; Schlesinger, *op. cit.;* and John Grumm, "Structure and Policy in the Legislature," (Paper presented at the Southwestern Social Science Association Meetings, 1967).

TABLE 4. RELATIONSHIPS BETWEEN THE COMPOSITE INNOVATION SCORE AND MEASURES OF LEGISLATIVE APPORTIONMENT AND PARTY COMPETITION

		Partials				
	Zero-Order	Value Added Manufacturing	Per Cent Urban	Total Population	Per Capita Income	Four Factors Combined
Apportionment						
David-Eisenberg Index	.65	.47	.64	.67	.60	.58
Schubert-Press Index	.26	.12	.34	.31	.26	.21
Party Competition						
Hofferbert Index	.54	.35	.34	.50	.26	.12
Riley-Walker Index —Gov.	.40	.33	.22	.47	.09	.17
Riley-Walker Index —Legis.	.31	.24	.17	.34	.04	.07
Turnover in Office						
Schlesinger Index of Opportunity	.53	.40	.39	.32	.34	.24
Legislative Services						
Grumm's Index of Legislative Professionalism	.63	.38	.33	.41	.51	.11

also partial correlations with four social and economic variables controlled. The control variables are value added by manufacturing, per cent urban population, total population size, and per capita personal income, all of which earlier proved to be independently related to the innovation score. In Table 4 the effect of each control variable is displayed separately along with the combined impact of all four. The results tend to corroborate earlier analyses which minimize the independent effects of these political variables on policy outcomes. The Schlesinger index of opportunity, which measures the difference among the states in the average number of times major offices have changed hands, and the Hofferbert index of inter-party competition seem to have some independent impact on innovation, although it is greatly weakened when all four control variables are combined. This finding lends some credence to Lowi's argument that turnover in office fosters change.

Certainly, the most important result depicted in this table is the consistent strength of the correlation between innovation and the David and Eisenberg index of urban representation.[26] Earlier studies, using expenditures as a measure of policy outcomes, have consistently found that apportionment has little importance as an explanatory variable.[27] Our findings indicate that apportionment does make a difference where innovation is concerned. Although the other political factors do not have great independent impact on innovation, the clear implication arising from Tables 3 and 4 is that those states which grant their urban areas full representation in the legislature seem to adopt new ideas more rapidly, on the average, than states which discriminate against their cities.

Given the results of this correlational analysis, we might conclude that New York, California and Michigan adopt new programs more rapidly than Mississippi, Wyoming, and South Dakota primarily because they are bigger, richer, more urban, more industrial, have more fluidity and turnover in their political systems, and have legislatures which more adequately represent their cities. Although these findings are important, they leave many important questions unanswered. The political system does not react automatically in response to the growth of manufacturing industries or to the increase in the percentage of the population living in cities. Developments of this kind obviously cause problems which public officials might try to solve, but the mere presence of such a stimulant does not cause public officials to act, nor does it determine the form the solution will take, or which state might act first to meet the problem. Our analysis has provided us with evidence that change and experimentation are more readily accepted in the industrialized, urban, cosmopolitan centers of the country, but we have not improved our understanding of the institutions and decision-making processes which cause strong statistical relationships between industrial output and innovation. Also, we have not explained the way innovations spread from the pioneering states to those with lower innovation scores. In order to develop explanations of these processes we must go beyond the search for demographic correlates of innovation and develop generalizations which refer to the behavior of the men who actually make the choices in which we are interested.

IV. POLITICAL SCIENCE AND INNOVATION

In one form or another, interest group theories, based on self-regulating systems of countervailing power, are at the heart of much of the recent research into American politics.[28] Studies of the legislative process in the United States, for example, have been strongly influenced by theories which emphasize the importance of the

[26] Although much simpler than the Schubert and Press measure, the David and Eisenberg index seems to have more relevance to political outcomes. Thomas Dye had the same experience. See Dye, *op. cit.*, pp. 19–20, 63–69, 112–114, 146–148, 174–177, 236–237, 270–281.

[27] Herbert Jacob, "The Consequences of Malapportionment: A Note of Caution," *Social Forces* (1964), 260–266; Thomas R. Dye, "Malapportionment and Public Policy in the States," *Journal of Politics* (1965), 586–601; Richard I. Hofferbert, "The Relation Between Public Policy and Some Structural and Environmental Variables in the American States," this REVIEW (1966), 73–82; David Brady and Douglas Edmonds, "One Man, One Vote—So What?" *Trans-action* (March, 1967), 41–46. A recent article calls some of the conclusions of this research into question: Alan G. Pulsipher and James L. Weatherby, Jr., "Malapportionment, Party Competition, and the Functional Distribution of Governmental Expenditures," this REVIEW (1968), 1207–1219.

[28] Examples of this general approach to policy making are: David B. Truman, *The Governmental Process* (New York, 1960); Edward Banfield, *Political Influence* (New York, 1961); and Richard E. Neustadt, *Presidential Power* (New York, 1960). For an excellent critique of theories which employ concepts of power as a major explanatory variable see: James G. March, "The Power of Power," in David Easton (ed.), *Varieties of Political Theory* (Englewood Cliffs, 1966), pp. 39–70.

group basis of politics. Beginning with the efforts of A. Lawrence Lowell[29] political scientists have worked to discover the basic factions within the legislature and have striven to develop operational definitions of power or influence.[30] Extensive efforts have been made to isolate and measure the various influences which come to bear on the individual legislator and motivate him to join one or another legislative bloc: what is a legislator's most important source of cues; is it a lobbyist with whom he has close connections, his party leaders, members of his constituency, the governor, or members of his own family? What impact on his attitudes does the legislative institution itself have; do its informal rules and traditions affect the legislator's decisions, and if so, in what way?[31] Great emphasis has been placed on the analysis of roll-call votes and several sophisticated research techniques have been developed to pursue this work, ranging from Beyle's cluster bloc analysis and Guttman scaling to the more complex, computerized routines presently in use.[32] But all this machinery is useful only in studying those roll-calls which cause divisions in the house; all unanimous votes, nearly eighty per cent of the total in most legislatures, are ignored. Riker has devised a technique in which he uses the percentage of the total membership which is present for the vote and the closeness of the division to determine the relative significance of roll-call votes in legislatures. The more legislators present and the closer the vote, the more significant the issue involved.[33] The full attention of the researcher is thus focused on the relatively small number of decisions which cause significant disagreements, because it is assumed that these are the most important votes; at least, they are the only ones which will provide clues to "the conflicting forces and pressures at work in the legislative system,"[34] and the discovery of those forces and pressures, according to the group theory of politics, is the principal object of political science.

One of the main purposes in this study is to develop an approach to governmental policy making which will serve as a guide in the analysis of *all* legislative decisions, the unanimous as well as the contested ones, and which will lead as well to a better understanding of decisions made by bureaucrats, political executives and other governmental officials. Rather than focus upon the patterns of conflict among factions within the legislature or the administrative agencies, I will search for the criteria employed by legislators and administrators in deciding whether a proposal is worthy of consideration in the first place. This search rests on the belief that whoever the decision maker may be, whether administrator, lobbyist, party leader, governor or legislator, and however controversial a particular issue may become, a set of general criteria exists in every state which establishes broad guidelines for policy making. Regardless of the interests supporting an innovation, no matter whether the decision system is primarily monolithic or pluralistic, if a proposal for change does not fall within those guidelines its chances for acceptance are slim. Many of the propositions I will develop cannot be verified until they are tested with evidence from individual decision makers;[35] they are presented here only as a first, tentative step toward a more comprehensive theory of governmental policy making.

V. EMULATION AND DECISION MAKING IN THE STATES

We are searching for answers to three major questions: 1) why do certain states consistently adopt new programs more rapidly than other states, 2) are there more or less stable patterns of diffusion of innovations among the American states, and 3) if so, what are they? Our answers to these questions will be founded, in part, on the theories of organizational decision making developed in recent years by writers like Simon, March, Cyert and Lindblom.[36] At the

[35] Thanks to a grant from the Carnegie Corporation I have been able to launch a pilot study involving interviews in several states.

[36] I refer to: Herbert Simon, *Administrative Behavior*, Second Edition (New York, 1957); Richard M. Cyert and James C. March, *A Behavioral*

heart of these theories is the concept of the decision maker struggling to choose among complex alternatives and constantly receiving much more information concerning his environment than he is able to digest and evaluate. An ordinary decision maker, required to make frequent choices and faced with an inconclusive flood of reports, programs, suggestions and memos, must simplify his task in some way. According to Simon, he does not—cannot—search in every case for the best possible solution to the problems he faces; he has neither the time nor the energy. Instead, he makes decisions by searching until he finds an alternative which he believes is good enough to preserve whatever values are important to him. The limits of rationality imposed by human capacities prevent him from maximizing his benefits in every situation; rather, he "satisfices," or chooses a course of action which seems satisfactory under the circumstances.

The individual in a complex organization, therefore, does not deal directly with all the sources of information potentially available to him, nor does he evaluate every conceivable policy option. In place of the debilitating confusion of reality he creates his own abstract, highly simplified world containing only a few major variables. In order to achieve this manageable simplicity he adopts a set of decision rules or standard criteria for judgment which remain fairly stable over time and which guide him in choosing among sources of information and advice. A decision maker decides both where to look for cues and information and how to choose among alternatives according to his decision rules; these rules also embody the current goals and aspirations of his organization, or the values which the organization is designed to advance and protect. Hence, if we wish to predict the decision maker's behavior, we should try to discover these rules of thumb, or "heuristics" as they are sometimes called, which shape his judgment. His choices could then be explained in terms of the alternatives he considers, his knowledge of each alternative, the sources of his knowledge, and the standard decision rules he applies in cases of this kind.[37]

Taking cues from these theories of human choice and organizational decision making our explanation of the adoption of innovations by the states is based on the assertion that state officials make most of their decisions by analogy. The rule of thumb they employ might be formally stated as follows: *look for an analogy between the situation you are dealing with and some other situation, perhaps in some other state, where the problem has been successfully resolved.*[38]

We are looking to what has been called the "inter-organizational context."[39] or the *horizontal* relationships among the states within the federal system, for the principal influences which regulate the speed of adoption and the patterns of diffusion of innovations. Most of the existing work on intergovernmental relations and federalism concentrates on the question of centralization within the American system of government. In line with the general interest of most political scientists in the factors which affect the access of organized groups and the lines of authority within a political system, many writers are concerned with the virtues of centralization or decentralization and try to determine how much of either exists in the system. They have studied primarily the *vertical* relationships among national, state and local governments, and have usually identified the party system and its demands as the institutional influence most responsible for maintaining the present, decentralized, federal relationships.[40] I want to focus attention on the mutual perceptions and relationships among state governments and to show how

Vile, *The Structure of American Federalism* (London, 1961); William Riker, *Federalism: Origin, Operation, Significance* (Boston, 1964); Daniel J. Elazar, *American Federalism: A View From the States* (New York, 1966); Morton Grodzins, *The American System* (Chicago, 1966). For a general critique see: A. H. Birch, "Approaches to the Study of Federalism," *Political Studies* (1966), 15–33.

these relationships affect the behavior of state decision makers.[41]

One of the most common arguments used in state legislatures against raising taxes or passing measures designed to regulate business is the fear that such measures might retard industrial development or force marginal plants to leave the state. Lawmakers often are called upon to deal with the problems which arise when one or two states establish extremely permissive standards for the granting of licenses, such as the corporation laws in New Jersey and Delaware, or the divorce laws in Nevada. However, interstate competition does not always drive standards down; it has a positive side as well. State decision makers are constantly looking to each other for guides to action in many areas of policy, such as the organization and management of higher education, or the provision of hospitals and public health facilities. In fact, I am arguing that this process of competition and emulation, or cuetaking, is an important phenomenon which determines in large part the pace and direction of social and political change in the American states.[42]

Uncertainty and the fear of unanticipated consequences have always been formidable barriers to reform. Proponents of new programs have always had to combat the arguments of those who predict dire consequences if some innovation is adopted. Even though American history is full of cases where the opponents of change have later had to admit that the dangers they feared never materialized, inertia and the unwillingness to take risks have prevented a more rapid rate of change.

Inertia can more easily be overcome, however, if the proponent of change can point to the successful implementation of his program in some other similar setting. If a legislator introduces a bill which would require the licensing of probation officers, for example, and can point to its successful operation in a neighboring state, his chances of gaining acceptance are markedly increased. As Harsanyi has asserted:

> . . . it is not an overstatement to say that a very considerable part of the social values of most societies is based on sheer ignorance. . . . One of the reasons why other persons' example is so important in encouraging changes in people's values and behavior lies in the fact that it tends to dispel some groundless fears about the dismal consequences that such changes might entail. Another reason is of course that people can more easily face the possible hostility of the supporters of the old values if they are not alone in making the change.[43]

In fact, once a program has been adopted by a large number of states it may become recognized as a legitimate state responsibility, something which all states ought to have. When this happens it becomes extremely difficult for state decision makers to resist even the weakest kinds of demands to institute the program for fear of arousing public suspicions about their good intentions; once a program has gained the stamp of legitimacy, it has a momentum of its own. As Lockard found in studying the passage of Fair Employment Practices laws the actions of other states are sometimes key factors in prompting

---

[41] This is not the first study to discover the important role of emulation and competition in the development of public policy. Richard Hofferbert in: "Ecological Development and Policy Change in the American States," *Midwest Journal of Political Science* (1966), p. 485; and Ira Sharkansky in: "Regionalism, Economic Status and the Public Policies of American States," *Southwestern Social Science Quarterly* (1968) both mention the influence of other states in the calculations of state decision makers. Several earlier students of local government complained that sparsely populated, arid Western states had blindly copied from the heavily populated Eastern states forms of local government which were inappropriately suited for the conditions prevailing in the Great Plains. See: A. Bristol Goodman, "Westward Movement of Local Government," *The Journal of Land and Public Utility Economics* (1944), pp. 20–34; Herman Walker, Jr. and Peter L. Hansen, "Local Government and Rainfall," this REVIEW (1946), 1113–1123. Robert L. Crain has recently used emulation as a principal explanatory variable in his study of the spread of water fluoridation programs among American cities: "Fluoridation: The Diffusion of an Innovation Among Cities," *Social Forces* (1966), 467–476; as did Thomas M. Scott in his: "The Diffusion of Urban Governmental Forms as a Case of Social Learning," *The Journal of Politics* (1968), 1091–1108.

[42] This set of hypotheses is consistent with more general theories concerning the manner in which human beings formulate judgments and establish expectations in all areas of life. See: Leon Festinger, "A Theory of Social Comparison Processes," *Human Relations* (1954), 117–140; and Robert Merton, *Social Theory and Social Structure* (Rev. Ed.; Glencoe, 1957), pp. 225–420.

[43] John C. Harsanyi, "Rational Choice Models v. Functionalistic and Conformistic Models of Political Behavior," (Paper delivered at American Political Science Association Meetings, 1967), p. 17.

reluctant politicians to accept controversial programs.

Pressure mounted in New Jersey during 1944 and 1945 for some stronger policy, and when New York passed its FEP law certain key politicians in New Jersey decided to act. Governor Walter E. Edge concluded, apparently reluctantly, that he had to commit himself to such a law. "As the session drew to a close," Edge wrote in his autobiography, "minority racial and religious groups pressed for adoption of an antidiscrimination program. While it was a subject which I would have preferred to give greater study, politically it could not be postponed because New York had passed a similar measure and delay would be construed as a mere political expedient."[44]

For similar reasons there have been numerous efforts to enact a program of homesteading in Hawaii as a way of disposing of its arable public lands even though the circumstances there are quite different from other states where homesteading was successfully introduced.[45] And in Connecticut one of the most powerful arguments in favor of introducing the direct primary system during the 1950's was simply that all the other states had adopted one.[46]

The Connecticut case neatly illustrates some of the generalizations we are developing. Lockard points out that the leaders of both political parties privately opposed the introduction of a primary system but felt that an endorsement of the idea had to be put into their platforms to avoid having their opponents charge them with "bossism." Demands for the primary came for the most part from small groups in the state's suburban areas which were interested in the issue as "a consequence of the influx of migrants from states with primaries."[47] Speaking as a professional political scientist as well as a legislator, Lockard was well suited to counter the extreme fears expressed by the party leaders who predicted that party organizations would be completely destroyed if primaries were introduced. Lockard reasoned by analogy to the experience in other states both in countering the opponents of change and in shaping his own moderate position:

I expressed my considerable doubts about the effect of party primaries on party organization. From observations of politics in some of the most thoroughgoing party primary states, [however,] it seemed that the party organizations had been shattered with many undesirable consequences. In my campaign I expressed support only for a limited form of a primary and not one calculated to wreck the party system.[48]

Events like these illustrate the way in which the agenda of controversy in a state is determined, at least in part, by developments in other states, and they also show how experiences and examples from outside the system help to overcome the natural reluctance of any institutional structure to risk the consequences of change. The constituent units of any federal system are under considerable pressure to conform with national and regional standards or accepted administrative procedures. These norms result primarily from the processes of emulation and competition we have described and also from the efforts of nationally organized interest groups. They are affected also by the growth and development of professional organizations and other forms of communication among state administrators, and the natural circulation of active, politically involved citizens among the states, such as the Connecticut suburbanites who began agitating for a primary system in their adopted political home.

VI. REGIONAL REFERENCE GROUPS AND STANDARDS OF EVALUATION

Nationally accepted standards or norms provide a convenient measure which can be used by interested citizens or political leaders to judge the adequacy of services offered in their own states. But these norms have an ambiguous influence on the performance of state governments. On the one hand, the existence of national standards probably encourages *higher* performance among the *poorer* members of the federation than we could expect if functions and service levels were established independently within each unit of government, solely as a result of internal demands. An example of this tendency was discovered by May in his study of Canadian federalism:

Newfoundland chose for a long time to remain outside the Canadian federation, thus not subjecting itself to the forces of national reorientation, and when, after joining the Dominion, a royal commission reported on its financial position, the commission observed that Newfoundland's public services were very backward in re-

lation to those of the other provinces, including even the maritimes. . . .[49]

In the United States, Mississippi, Vermont, and North Dakota are good examples of relatively poor states which are making unusually large efforts to bring their public services into closer approximation of national standards. But, on the other hand, national standards and norms can have a *conservative* impact, especially in the richer, industrial states which are able to provide services somewhat above the national averages with relatively little effort.[50] Hansen complains of this tendency when he points out that:

> Some northern states fall considerably below their northern neighboring states in public service standards. . . . Their fiscal problems arise not because they are poor but because their tax levels are low by northern standards. This is notably true for example of a tier of large industrial states—Illinois, Indiana, Ohio and Pennsylvania. . . . These states are not excessively hard pressed by tax burdens relative to the country as a whole.[51]

This statement by Hansen is drawn from an essay in which he expresses disapproval of what he considers the inadequate public services of large industrial states which have relatively low tax burdens. But the statement we have cited contains several ambiguities. For example, Hansen charges that "some northern states fall considerably below their northern neighboring states in public service standards," but then he specifically points as examples to Illinois, Indiana, Ohio, and Pennsylvania, states which border on each other. It is not clear whether we are being asked to compare these states to their neighbors, to other northern states with higher tax burdens, or to "the country as a whole." Within Illinois, however, the states' decision makers are probably comparing their own performance with their counterparts in Indiana, Ohio, Pennsylvania or New Jersey. Officials in Illinois may know of the procedures and performance levels in New York or California, but they are unlikely to think of events in these states as legitimate guides to action.[52]

When examining the public policy of any state, therefore, it is important to discover in which "league" it has chosen to play. For example, Salisbury, in a statement much like Hansen's, reasons by analogy in arguing that Missouri does not provide as much aid for its schools as its potential resources might warrant. He points out that in 1959 the "state ranked 18th in per capita income but 38th in per capita expenditure for local schools."[53] This relatively low level of support seems to result from the correspondingly low aspirations of the officials of the Missouri State Teachers Association who, according to Salisbury, "have chosen to get what they can with a minimum of agitation or conflict rather than attempt broader public campaigns in behalf of larger objectives."[54] The officials of MSTA "are fully conscious of the gap between the Missouri school aid level and that of, say, neighboring Illinois," but they are quick to point out "that by comparison with other neighboring states—Arkansas, Oklahoma, or Nebraska, for example—Missouri's record is much more impressive."[55] It would seem from this example that Missouri's leaders, at least those concerned with public education, are emulating and competing primarily with the states to their south and west, rather than with the Great Lakes states to their north and east, or the Rocky Mountain states, the Deep South or the Far West. The choice of relatively poor states like Arkansas and Oklahoma as the principal, legitimate reference groups establishes an upper limit of aspirations which is considerably below that which might exist if Missouri's accepted basis for comparison were the public services of Illinois, Wisconsin or Michigan.

VI. REGIONAL GROUPINGS AMONG THE STATES

We have come far enough in our analysis to see that our original presentation of the innovation scores in Table 1 as a linear distribution masked some pertinent information. A more useful representation of the data, which would con-

Browning, "Innovative and Noninnovative Decision Processes in Government Budgeting," in Robert T. Golembiewski (ed.), *Public Budgeting and Finance* (Itasca, Illinois, 1968), pp. 128–145.

form more closely to the actual patterns of diffusion, would have to be in the form of a tree. At the top of the tree would be a set of pioneering states which would be linked together in a national system of emulation and competition. The rest of the states would be sorted out along branches of the tree according to the pioneer, or set of pioneers, from which they take their principal cues. States like New York, Massachusetts, California, and Michigan should be seen as regional pace setters, each of which has a group of followers, usually within their own region of the country, that tend to adopt programs only after the pioneers have led the way. For example, Colorado, which ranks ninth in Table 1, might be seen as the regional leader of the Rocky Mountain states. The rest of the states in that region are found much further down the list: Utah is twenty-second, Idaho is thirty-third, Arizona is thirty-sixth, Montana is thirty-eighth, New Mexico is forty-first, Wyoming is forty-sixth, and Nevada is forty-seventh. All of these states, with the possible exception of Utah which may share in the leadership of the region, might be seen as Colorado's followers who usually pick up new ideas only after the regional pioneer has put them into practice.

If we are right about the general patterns of competition and emulation, we should discover in our data some evidence of the existence of regional clusters among the states. In an effort to find such groupings, a varimax factor analysis was performed, using a matrix of pair-wise comparisons of all state innovation scores on all eighty-eight issues. If states in the same region are adopting programs in a similar order or pattern over time, a factor analysis should uncover several underlying dimensions in the matrix along which all states would be ordered according to their responses to the programs upon which the innovation score is based. The results of the factor analysis are presented in Table 5.

As we can see, the regional groupings we expected to find do exist, although the patterns are not as neat and clear as we might have hoped. To produce each factor I recorded all loadings which were over .400. The five factors which result bring the states into generally recognizable, contiguous groupings. The states with the largest loadings in each region are not necessarily those with the highest innovation scores. Instead, they are states like Connecticut, Florida, or New Mexico whose innovation scores are closer to the average for their regions. The presence of Nebraska, Iowa and South Dakota on Factor 1, which otherwise identifies Southern states, may indicate that more than one regional cluster is being identified on that factor.

There are several ambiguities in the data. For example, New York, Pennsylvania, West Virginia, Arkansas, and Illinois are loading on more than one factor. The easiest explanation of this may be that the states actually have connections with more than one region. This is especially true of New York, the state with the highest innovation score, which displays fairly strong connections in this analysis with the New England. Mid-Atlantic, and Great Lakes states. I believe that this finding reflects the fact that New York actually serves as a model for states in all three areas. Certainly New York is formally involved in interstate compacts with all three regions, and, if nothing else, enjoys a perfect geographical position from which to carry on relations over such a large area. If the findings concerning New York seem explainable, those concerning California do not. I cannot explain why California loads on Factor V, especially since many of its neighbors load on Factor III. These ambiguous findings concerning New York and California might be merely a reflection of ambiguity in the data. Factor analysis will identify regional groupings in the data only if the regions respond to new programs as a unit, adopting some new ideas with haste and lagging behind on others. Since New York and California consistently lead the country in the adoption of new programs, they may not be members of the cohesive regional group or "league" of states, a fact which may prevent their neat categorization through factor analysis.

There is no accounting at all in this analysis for the behavior of three states: Arizona, Colorado, and Kansas. Both Colorado and Arizona load at the .300 level on Factor III, the one which includes most of the rest of the Rocky Mountain states. Colorado and Nevada both load strongly (.577 and .485 respectively) on a separate factor which was not reported since no other state scored higher than .300 on the factor and its contribution score was only 1.7. The same is true for Kansas which was the only state loading strongly (at .658) on a factor whose contribution score was only 1.9.

VII. SPECIALIZED COMMUNICATIONS AMONG THE STATES

Our analysis has provided evidence that a continuum exists along which states are distributed from those which are usually quick to accept innovations to those which are typically reluctant to do so; we also know something about the correlates of innovation and have evidence of regional groupings among the states; but it is not always easy to identify a regional pioneer or to know exactly which states make up each

"league" or sub-system of cue-taking and information exchange. Some states seem to have connections with more than one region and may regularly receive cues from states in both groupings. As the American political system has developed, an increasing number of specialized communication systems have been created which cut across traditional regional lines and bring officials from many different regions into contact with each other and with federal and local officials, journalists, academic experts, and administrative consultants.

Several organizations now exist, such as the Council of State Governments, the Federal Commission on Intergovernmental Relations, and the recently established Citizen's Conference on State Legislatures, whose primary function is to improve communications among the states. Most important of these specialized communications networks are the professional associations of state officials, such as the National Association of State Budget Officers, or the National Association of State Conservation Officers. Associations of this kind were first created late in the nineteenth century and more seem to be forming each year. There were only five formed prior to 1900, but by 1930 there were approximately thirty-one, and by 1966 there were at least eighty-six in existence.[56]

[56] Unpublished memo from the Council of State Governments, Chicago, Illinois.

These groups serve two general purposes: first, they are sources of information and policy cues. By organizing conferences or publishing newsletters they bring together officials from all over the country and facilitate the exchange of ideas and knowledge among them, thus increasing the officials' awareness of the latest developments in their field. Secondly, these associations serve as "occupational contact networks" which expedite the interstate movement or transfer of personnel. Through the efforts of these groups officials become aware of desirable job openings in other states and are able to create professional reputations that extend beyond the borders of their own states.[57]

By rapidly spreading knowledge of new programs among state officials and by facilitating the movement of individuals to jobs in other states, professional associations encourage the development of national standards for the proper administration and control of the services of state government. Just as in other sectors of American life such as the business, the military and the academic world, as individuals increase their mobility, their role perceptions are likely to change; they are likely to adopt a more cosmopolitan perspective and to cultivate their reputations within a national professional community rather than merely within their own state or agency.[58]

Since general awareness of new developments is achieved much more quickly now than ever before, we would expect that the time which elapses from the first adoption of an innovation by a pioneering state to its complete diffusion throughout all the states would be greatly reduced. Certainly, several recent innovations, such as educational television or state councils on the performing arts, have diffused rapidly. In Table 6 we have measured the average speed of diffusion in years for three periods of time: 1870–1899, 1900–1929, and 1930–1966. The results shown in the first column of this table make it very plain that the speed of diffusion has been constantly increasing as time has passed. This measurement, however, is somewhat misleading. The second column of the table indicates the average number of years it took the first twenty states to adopt the programs in each time period. The same trend toward increased speed of diffusion is evident here, but the differences among the three time periods are much smaller.[59] This evidence suggests that the pioneering states, those with high innovation scores, adopted new programs about as quickly in the early part of this century, prior to the development of many specialized communication links, as they did in the 1960's. The total elapsed time of diffusion, however, has decreased primarily because the laggard states, those with low innovation scores, are now reacting more quickly to pick up new programs adopted by the pioneers. This development results partly from the efforts of the federal government to stimulate state action through grants-in-aid, and partly from the increasing professional development in state government. Both these tendencies seem to have had a larger impact on the behavior of the more parochial states than the more cosmopolitan, pioneering states.

TABLE 6. AVERAGE ELAPSED TIME OF DIFFUSION IN YEARS FOR INNOVATIONS IN THREE TIME PERIODS

Time Periods	For All Adoptions	First Twenty Adoptions
1870–1899:	52.3	22.9
1900–1929:	39.6	20.0
1930–1966:	25.6	18.4

VIII. THE PERSISTENCE OF REGIONALISM

Improved communications and greatly increased contacts of all kinds among state officials seem to be accelerating the process of diffusion, but this does not necessarily mean that the regional clusters or "leagues" of states

[57] For a discussion of the role of professional organizations in determining career lines see: Fred E. Katz, "Occupational Contact Networks," *Social Forces* (1958), 52–58. Also see: Jack Ladinsky, "Occupational Determinants of Geographic Mobility Among Professional Workers," *American Sociological Review* (1967), 253–264.

[58] Merton, *op. cit.* Also see: Alvin W. Gouldner, "Cosmopolitans and Locals: Toward an Analysis of Latent Social Roles," *Administrative Science Quarterly* (1957), 281–306; and Harold L. Wilensky, *Intellectuals in Labor Unions* (Glencoe, 1956).

[59] A small portion of the difference between the two columns in Table 6 is an artifact of measurement. Since not all the programs in this analysis have been adopted by all forty-eight states, laggard states sometimes remain. As time passes and programs receive widespread acceptance these laggard states slowly fall into line and adopt the programs. Since the programs in the first two time periods have been around longer, they have more likely completed their spread among the states and thus, given our scoring procedure, are also more likely to have a longer period of diffusion.

to which we have referred have been destroyed.[60] In order to investigate this question the innovation scores in the time periods from 1870 to 1929 were combined, and two matrices of innovation scores of almost equal size were created, one for 1870–1929 and the other for 1930–1966.[61] Within each of these matrices each state's set of innovation scores (issue by issue) was correlated with the set of innovation scores for each other state. A varimax factor analysis was performed on each matrix, just as was done earlier to produce Table 5.

The results of this analysis are presented in Table 7. The factors derived from 1870–1929 are presented in the left column of the table and those from 1930–1966 are presented in the right column. The factors from each time period are arranged with the highest loadings first and the rest following in descending order. As we can see, the factors from the two time periods are not completely comparable. Some states change their relative rankings on the two factors, and some appear on a factor during only one of the time periods. The state of Georgia, for example, is found at the bottom of Factor 1 during 1870–1929 and moves all the way to the top of the same factor during 1930–1966. Some regional groupings, such as New England, seem to be disintegrating, while others, such as the Middle Atlantic states, seem to be more clearly defined in the later period. The factors for the later period include more states, on the average, and have slightly higher contribution scores, but they are not quite as distinct as those in the early period and include more inappropriate loadings. These data do not contain evidence of any large scale erosion of regionalism in the United States, but a drift away from clearly defined clusters of states is apparent.

During the last thirty years many new professional associations have been formed and more inter-state and federal agencies have begun facilitating communications and encouraging national uniformity. The diffusion process is operating much faster today than ever before, especially among those states which have traditionally lagged behind in adopting new ideas. The older, established modes of communication and evaluation, based on traditional ties of region and common culture, are persisting, but there are indications in these data that the system is slowly changing. Decision makers in the states seem to be adopting a broader, national focus based on new lines of communication which extend beyond regional boundaries.

IX. CONCLUSIONS

This essay began as an effort to explain why some states adopt innovations more rapidly than others, but in order to explain this aspect of American federalism, we have had to make a more extensive investigation of the complex system of social choice by which we are governed. The approach to policy making which has emerged from our investigation is founded on the perceptions and attitudes of individual state decision makers. Of course, as I have already mentioned, the theory cannot be fully elaborated or put to a test until data can be gathered directly from legislators, bureaucrats, governors, and other officials in several states, on a comparative basis. Enough evidence has been presented already, however, to make apparent the major theoretical and practical implications of this approach.

The theory presented here directs our attention to the rules for decision employed by policy makers, rather than their formal group affiliations or their relative power or authority, and thus enables us to offer useful explanations of all policy decisions, not merely those which generate controversy. Emphasis is placed on those factors which lead to the establishment of parameters or guidelines for decision, not on the groups or interests supporting one policy over another. In Figure 1 the outlines of the diffusion process are depicted as it operates in a single state. There are undoubtedly many other influences on the level of agitation for change than the ones presented here, and many other secondary effects stemming from the enactment of new programs; this simple diagram is only meant to summarize the fundamental process operating in most cases of diffusion. Relationships are characterized by plus and minus signs but no effort has been made to estimate their relative importance in the system.

The process we have been describing is extremely complex; many influences shape deci-

[60] The best recent analysis of long-term changes in the American political system is: Donald Stokes, "Parties and the Nationalization of Electoral Forces," in William N. Chambers and William D. Burnham (eds.), *The American Party Systems: Stages of Political Development* (New York, 1967), pp. 182–202. Also see: Norval D. Glenn and J. L. Simmons, "Are Regional Cultural Differences Diminishing?" *Public Opinion Quarterly* (1967), 196–205; and Ira Sharkansky, "Economic Development, Regionalism and State Political Systems," *Midwest Journal of Political Science* (1968), 41–61.

[61] When the data are combined in this manner the 1870–1929 matrix contains 42 issues and the 1930–1966 matrix contains 46 issues.

sions to adopt innovations and no two ideas diffuse in exactly the same way. In all cases, however, the likelihood of a state adopting a new program is higher if other states have already adopted the idea. The likelihood becomes higher still if the innovation has been adopted by a state viewed by key decision makers as a point of legitimate comparison. Decison makers are likely to adopt new programs, therefore, when they become convinced that their state is relatively deprived, or that some need exists to which other states in their "league" have already responded.

Before states may respond to new programs adopted in other states their political leaders must be aware of these developments, so interstate communications are an important factor in the process of diffusion. We have mentioned that many specialized systems of communication among the states have grown up during the last thirty years, mainly through the creation of

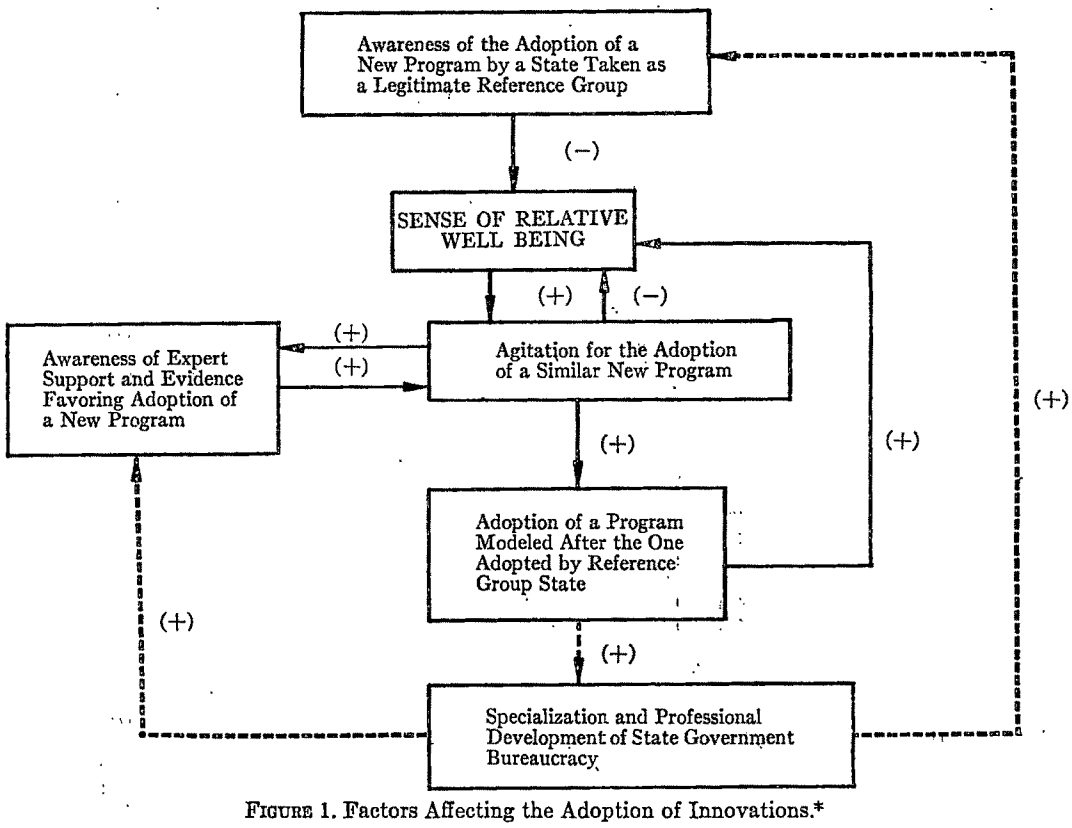

FIGURE 1. Factors Affecting the Adoption of Innovations.*

* Secondary effects depicted by broken lines.

professional associations among state administrators. These new information networks are spreading into all the states, but even today the isolation of some state capitols from the major cosmopolitan centers of the country is a major obstacle to the adoption of new ideas.[62]

Emerging from this study is the picture of a national system of emulation and competition. The states are grouped into regions based on both geographical contiguity and their place in the specialized set of communication channels through which flow new ideas, information and policy cues. Through this nationwide system of communications a set of norms or national standards for proper administration are established. This system links together the centers of research and generation of new ideas, national associations of professional administrators, interest groups, and voluntary associations of all kinds into an increasingly complex network which connects the pioneering states with the more parochial ones. Because of the limitations of the data presently available to us we can only outline each regional grouping of states, and we cannot yet construct an elaborate theory of the interactions among professional associations, federal officials, private interest groups, and political leaders in setting the agenda of politics within a state. Normative questions arise, which cannot be considered here, concerning the responsiveness of this system and the degree to which it is subject to the control of democratic, representative institutions.[63] Much more investigation will

[62] See Alan L. Clem's description of the isolation of Pierre, the capitol of South Dakota, in his: *Prairie State Politics: Popular Democracy in South Dakota* (Washington, 1967), p. 137; and Norton E. Long's emphasis on the importance of information sources in his: "After the Voting is Over," *Midwest Journal of Political Science* (1962), 183–200. For a general review of communications theory and its application to politics see: Richard R. Fagen, *Politics and Communication* (Boston, 1966), especially pp. 34–69, 88–106. Also see: Karl W. Deutsch, *The Nerves of Government*, Second Edition, (New York, 1966), especially pp. 145–256.

[63] Questions of this kind have been raised already in: Daniel P. Moynihan, "The Professionalization of Reform," *The Public Interest* (1965), 6–16; Theodore J. Lowi, "The Public Philosophy: Interest Group Liberalism," this REVIEW (1967), 5–24; and Philip Green, "Science, Government, and the Case of RAND: A Singular Pluralism," *World Politics* (1968), 301–326.

be necessary before we can gain a full understanding of this system and its function as a device for controlling the pace and direction of policy development in the American states. Once we know more, it might be possible to prescribe with confidence some changes in the decision-making system, or the creation of some new governmental institutions, which might accelerate or redirect the process of innovation.

APPENDIX

NOTE: Following are the eighty-eight programs upon which the innovation score is based.

1. Accountants Licensing
2. Advertising Commissions
3. Agricultural Experiment Stations
4. Aid for Roads and Highways
5. Aid to the Blind (Social Security)
6. Aid to Dependent Children (Social Security)
7. Aid to Permanently and Totally Disabled (Social Security)
8. Air Pollution Control
9. Alcoholic Beverage Control
10. Alcoholic Treatment Agencies
11. Anti-Age Discrimination
12. Anti-Injunction Laws
13. Architects Licensing
14. Australian Ballot
15. Automobile Registration
16. Automobile Safety Compact
17. Beauticians Licensing
18. Board of Health
19. Budgeting Standards
20. Child Labor Standards
21. Chiropractors Licensing
22. Cigaret Tax
23. Committee on the Aged
24. Compulsory School Attendance
25. Conservation of Oil and Gas
26. Controlled Access Highways
27. Council on the Arts
28. Court Administrators
29. Debt Limitations
30. Dentists Licensing
31. Direct Primary
32. Education Agencies
33. Education Television
34. Engineers Licensing
35. Equal Pay for Females
36. Fair Housing—Private
37. Fair Housing—Public Housing
38. Fair Housing—Urban Renewal Areas
39. Fair Trade Laws
40. Fish Agency
41. Forest Agency
42. Gasoline Tax
43. Geological Survey
44. Highway Agency
45. Home Rule—Cities
46. Human Relations Commissions
47. Initiative and Referendum
48. Integrated Bar
49. Junior College—Enabling Legislation
50. Juveniles Supervision Compact
51. Labor Agencies
52. Legislative Pre-Planning Agencies
53. Legislative Research Agencies
54. Library Extension System
55. Mental Health Standards Committee
56. Merit System
57. Migratory Labor Committee
58. Minimum Wage Law
59. Normal Schools—Enabling Act
60. Nurses Licensing
61. Old Age Assistance (Social Security)
62. Parking Agencies—Enabling Act for Cities
63. Park System
64. Parolees and Probationers Supervision Company
65. Pharmacists Licensing
66. Planning Board—State Level
67. Development Agency
68. Police or Highway Patrol
69. Probation Law
70. Public Housing—Enabling Legislation
71. Real Estate Brokers—Licensing
72. Reciprocal Support Law
73. Retainers Agreement
74. Retirement System for State Employees
75. Right to Work Law
76. School for the Deaf
77. Seasonal Agricultural Labor Standards
78. Slaughter House Inspection
79. Soil Conservation Districts—Enabling Legislation
80. Superintendent of Public Instruction
81. Tax Commission
82. Teacher Certification—Elementary
83. Teacher Certification—Secondary
84. Urban Renewal—Enabling Legislation
85. Utility Regulation Commission
86. Welfare Agency
87. Workmens' Compensation
88. Zoning in Cities—Enabling Legislation

COMMUNICATIONS

To the Editor:

In the March, 1969 issue of the Review (pp. 157–162) Thomas Dye reported on an analysis of relationships between political processes, socio-economic characteristics, and policy outcomes in the American states. The analysis featured the Gini Index, a measure of the degree of inequality in the distribution of income within states, a characteristic never before investigated by political scientists. The format and methodology of the study resembled many others published on this subject during the last six years in that no effort was made to isolate regions within the country to find if relationships changed in different cultural or political settings.[1] We consider this a major shortcoming of Dye's analysis.

Since the Southern states all have relatively large inequalities in income distribution, they cluster at the top of the scale created by the Gini Index and are also grouped at the top or bottom of many of the the other measures of political participation and economic development employed in Dye's study. The differences are so great between the South and the rest of the country and the Southern states so homogeneous on many of the measures used by Dye that he is often dealing with two distinct populations. When regions cluster in this way the correlations reported from bi-variate relationships often reflect only the social and political distinctiveness of geographic regions within the country rather than the functional relationships between variables within state political systems. Because of the distinctive nature of the South, correlational analyses based on all the American states may either obscure important relationships existing at the regional level or may lead one to see relationships where none actually exists.

For example, Dye reports a strong negative correlation of −.64 between per capita personal income and his measure of income inequality. When the eleven states of the confederacy are removed from this distribution, however, the correlation for the remaining thirty-nine states is reduced to −.39, about half its original strength. Within the eleven Southern states the relationship increases to −.85, almost twice its original strength. In Figure 1 we display a scatter-plot of the relationship between the Gini Index and per capita personal income which demonstrates graphically why the removal of the South has such an impressive impact.[2] The Southern states are concentrated in the upper left portion of the graph and the remaining states are much more widely and irregularly dispersed. For the thirty-nine states outside the South, knowledge of a state's score on the Gini Index allows one to explain only 15 per cent of the variance in state scores on per capita personal income.

The removal of the South may affect correlations of data on the states in many different ways. In Table 1 we display correlations of Dye's Gini Index with twelve variables; scores for each relationship are shown with the South both included and removed from the distributions.[3] The result of the South's removal usually

[1] For a review of research on this subject see: John H. Fenton and Donald W. Chamberlayne, "The Literature Dealing With the Relationships Between Political Processes, Socio-economic Conditions and Public Policies in the American States: A Bibliographical Essay," *Polity* (Spring, 1969), pp. 388–94.

[2] The Gini Index is taken from Dye's article, *op. cit.;* the data on per capita personal income by state are for 1960 and are taken from: U. S. Bureau of the Census, *Statistical Abstract of the United States* (Washington, 1967).

[3] All demographic data are for 1960; all expenditure data are for 1959. Sources are: U. S. Bureau of the Census, *Ibid.* The industrialism factor score is from: Richard Hofferbert, "Socioeconomic Dimension of the American States: 1890–1960," *Midwest Journal of Political Science* (August, 1968), 401–418. Party competition scores for the Senate and House cover 1961–62 and are taken from: John Grumm, Calvin Clark and Edward Flentje, *State Data* (compiled for the Citizen's Conference on State Legislatures, 1967). The scores represent the minority party percentage of the two-party membership times two. Party competition scores for the Governorship cover 1962 and are taken from: Richard I. Hofferbert, *American State Socioeconomic, Electoral, and Policy Data: 1890–1960.* (By permission of the compiler). The scores represent the percent of the total vote going to the candidate coming in second, times two. Turnout figures have been computed on the basis of total population above voting age. Turnout scores are calculated for senatorial and gubernatorial races in non-presidential years from 1946 to 1962, and are reported in: Lester Milbrath, "Political Participation in the States" in Herbert Jacob and Kenneth N. Vines (eds.), *Politics in the American States* (Boston, 1965), pp. 25–60. The apportionment index appears in: Paul T. David and Ralph Eisenberg, *Devaluation of the Urban and Suburban Vote* (Charlottesville: Bureau of

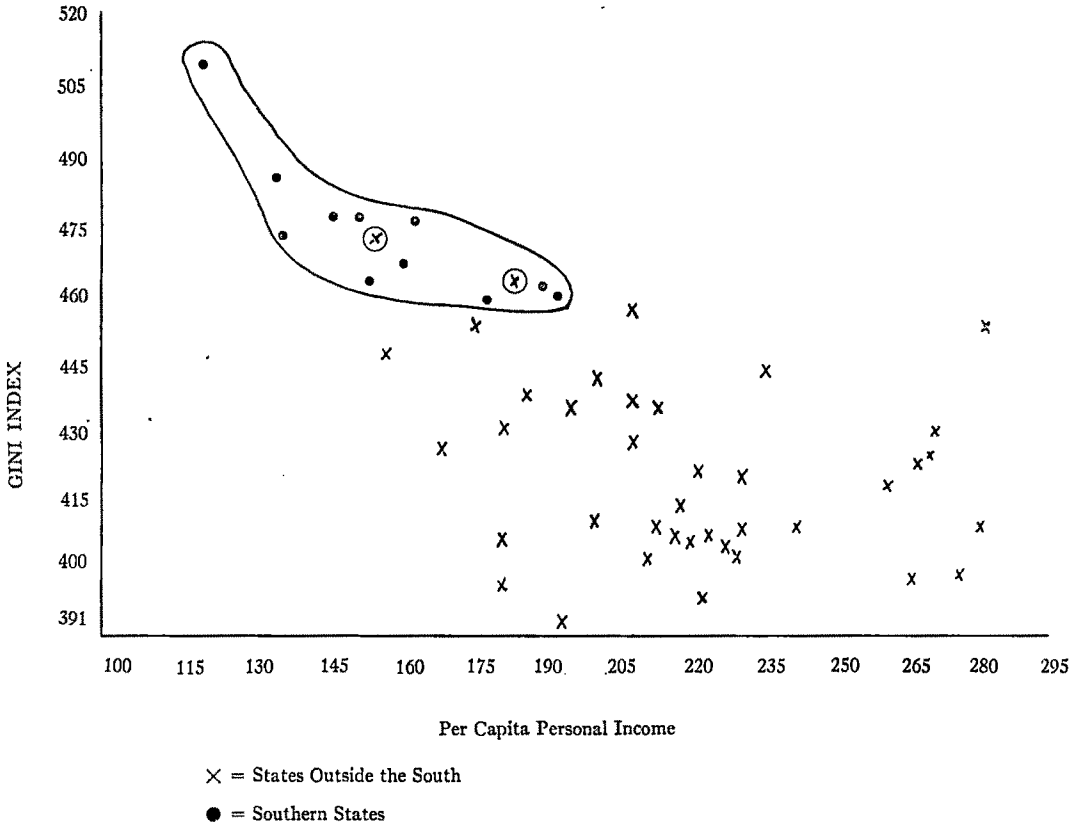

FIGURE 1. Per Capita Personal Income and the Gini Index.

is a sharp reduction in the correlation for the remaining thirty-seven states. The only exception is the case of per capita expenditures on welfare, where correlations increase when both regions are taken separately. The correlations within the Northern states for urbanism, industrialism, apportionment, and the formal powers of the governor are lowered, but do not change radically. Relationships are reduced to insignificance, however, for per cent Negroes, measures of party competition, electoral turnout, total per capita expenditures, or per capita expenditures for highways. Within the South the relations between the Gini Index and the political system measures are either eliminated, rendered insignificant, or greatly reduced in size. By testing for the regional effect, however, we have uncovered a strong positive relationship within the South between the Gini Index and Hofferbert's industrialism factor score which was concealed in Dye's analysis. Dye also reports that total per capita expenditures and per capita expenditures for highways are negatively correlated with income inequality, but we find, even though the coefficients are still small, that within the South the two variables actually are *positively* related to one another.

We have concentrated on the eleven states of the confederacy because Dye's Gini Index tends to emphasize their distinctiveness and there are good reasons to assume that they form a natural region. They are not only contiguous, but also share sociological and economic characteristics which set them apart from the rest of the country. Of course, the boundaries of the region are not necessarily confined to the states we have chosen; the distinctive political culture of the South may be found within portions of states outside the region, just as some parts of Texas or Florida could no longer be considered part of the South in sociological terms.[4] Nor is

Public Administration, University of Virginia, 1961). The index of the formal powers of the governor can be found in: Joseph A. Schlesinger, "The Politics of the Executive," in Herbert Jacob and Kenneth N. Vines (eds.), *op. cit.* pp. 207–237.

TABLE 1. INCOME INEQUALITY CORRELATED WITH SELECTED ECONOMIC VARIABLES*

Economic Development Measures	All States	Northern States	Southern** States
Percentage Population Negro	.74	.16	.68
Industrialism Factor Score	.33	.28	.74
Percentage Population Urban	−.48	−.37	−.58
Political System Measures			
Competition for Senates	−.70	−.06	−.17
Competition for Houses	−.76	−.03	−.26
Competition for Governorships	−.54	.16	.13
Percentage Voter Turnout	−.82	−.18	−.39
David and Eisenberg Apportionment	−.45	−.40	−.03
Formal Powers of Governor	−.43	−.33	−.22
Policy Output Measures			
Per Capita Expenditures—Welfare	.26	.36	.32
Per Capita Expenditures—Highways	−.29	−.10	.24
Total Per Capita Expenditures	−.20	.01	.28

* Alaska and Hawaii were omitted because of missing data for several variables.

** Southern states are: Alabama, Arkansas, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Texas, and Virginia.

the South the only distinctive region in the country. If median school years completed were one of our predictor variables we would find that the Rocky Mountain states form a distinctive area, and if we were concerned with the size of legislative bodies or per capita expenditures for higher education we would have to deal with the peculiar characteristics of New England.[5]

Whichever region one examines, the results we report in Table 1 should be a convincing argument for the importance of testing relationships for the possible effects of regional differences. This would seem to be a necessary prerequisite to the creation of general theories of political participation or policy making. In an earlier work, however, Dye has made the opposite case, arguing that hypotheses must be tested using all fifty states:

> Since the object of comparative study is to develop general explanations which will apply to political systems universally, the universe of American state politics must include all the states. If we excluded any group of states from our analysis, or if we tested explanatory hypotheses with reference to regional groupings of states, we would be engaged in something other than genuine comparative analysis . . . if regional conditions, historical circumstances, or cultural patterns prevent the development of explanatory statements which apply to all fifty states, then genuine comparative study is impossible and general explanatory models have little value. . . . Certainly the inclusion of the 11 Southern states in our research operations will affect the results: but so does the inclusion of any other 11 states.[6]

The removal of any eleven states chosen at random would have no systematic impact upon correlation coefficients unless the states selected happened to form a natural or sociological region within the country.[7] Studies which proceed as if there were no regional peculiarities in data on the states must also make the prior assumption that an increase in party competition, a change in the system of legislative apportionment, or an increase in industrialism will have the same kind of impact on states as dissimilar as Nevada, New York, Mississippi, and Vermont. This assumption may be justifiable for some variables, but it plainly is not justifiable for many of those employed in recent studies. As Hayward Alker has written:

> A good deal of the literature of social science suggests that relationships between variables will be different for data from different geographic or cultural contexts. The best approach to these pos-

J. Brodbeck (eds.), *American Voting Behavior* (Glencoe, 1959), pp. 281–299; Raymond Wolfinger and Fred I. Greenstein, "Comparing Political Regions: The Case of California," this REVIEW (March, 1969), 74–85; and Daniel J. Elazar, *American Federalism: A View From the States* (New York, 1966).

[5] The importance of regions in the American political system has been recognized in several recent articles: Norval D. Glenn and J. L. Simmons, "Are Regional Cultural Differences Diminishing?" *Public Opinion Quarterly* (1967), 176–193; Ira Sharkansky, "Economic Development, Regionalism and State Political Systems," *Midwest Journal of Political Science* (1968), 41–61; and Jack L. Walker, "The Adoption of Innovations by the American States," this REVIEW (September, 1969).

[6] Thomas R. Dye, *Politics, Economics and the Public* (Chicago, 1966), p. 43.

[7] To check on this point a sample of eleven states was chosen from an alphabetical listing using a table of random numbers. Correlations of the Gini Index and several variables were then calculated using these new distributions. There were only small unsystematic changes in correlation coefficients based on distributions of forty-eight states and the eleven state sample, and no appreciable differences at all between the forty-eight state distributions and the thirty-seven state distributions.

sibilities of 'configurative regionalism' is a heightened sensitivity on the part of those who do universalistic analyses to possible regional or cultural differences. Regional specialists, on the other hand, should make continual distinctions between local events and worldwide patterns; they should state their findings in the most universal terms possible. There is a need to use and develop more adequate formal models of the various ways in which particular regional contexts influence configurations.[8]

We can never fully realize the potential of the American states for comparative political research if we attempt to build explanations based on correlations which are the result of statistical artifacts. Dye suggests that the distribution of resources within the state is more effective in shaping the character of political systems than in establishing the levels of public spending and service. The results of Table 1 provide little support for such a generalization; when the regions are taken separately there are as many significant correlations with measures of policy output as with measures of the political systems, and in both cases there are few strong relationships.

One of the virtues of the American states as objects of comparative analysis is that they are different. Some states are highly developed urban and industrial systems, others have vast unsettled stretches of land with total populations less than one fourth the size of New York City; some bear the impact of Southern history and traditions, others the influence of the Western frontier. One of our principal theoretical tasks is the creation of explanations for the way these differences, including regional differences, affect the political processes and governmental systems of the states. A truly universal theory would identify the common characteristics of states and also provide an explanation of their differences.

DENNIS D. RILEY
JACK L. WALKER
The University of Michigan

TO THE EDITOR:

A great deal of the research on state politics in recent years has employed a comparative approach in which propositions are developed and tested against data derived from *all* fifty states. This represents a departure from earlier studies of "New England politics," "Southern politics," "Midwest politics," "politics in Wisconsin," etc. The Riley-Walker note suggests that the field of state politics is ripe for a debate analogous to the "comparative approach" versus "area studies" debate in the field of comparative government. I hope this debate will develop along constructive rather than argumentative lines.

It is true that the removal of the eleven Southern states from an analysis of the impact of inequality on politics and public policy reduces the size of the coefficients. Since the Southern states are the most unequal in the nation, their removal reduces the range of variation in our inequality measure. Removing the Southern states, therefore, reduces our ability to assess the full impact of inequality on political systems. Fortunately for the sake of analysis (albeit unfortunately for many inhabitants), the Southern states *do* provide us the opportunity to observe the political correlates of inequality. Their inclusion in our analysis permits us to view relationships between inequality and politics which would not be observable in subsets of states where the range of inequality is narrow.

Riley and Walker are quite wrong in saying correlations based on all fifty states are "statistical artifacts." They are no more statistical artifacts than correlations based on 39 states, or 25 states, or any other number of states. Riley and Walker may choose to see whether a proposition developed in a comparative study of all fifty states applies within regional subsets, but such an exercise cannot detract from the validity of the general proposition as it applies to all fifty states. Their Table 1 does not contradict our findings that among the fifty states, where variation in inequality is substantial, inequality is independently related to a number of important political variables.

In short, I am interested in developing propositions based on all fifty states, propositions which describe the full range of system behavior in the American states. Riley and Walker develop some propositions which apply to regional subsets of states. Both are equally valid exercises depending upon the purposes of the researcher.

TO THE EDITOR:

It is embarrassing to have to defend the merits of one's own work. I do so chiefly in the hope

[8] Hayward R. Alker, Jr., "Regionalism Versus Universalism in Comparing Nations," in Bruce Russett, *et al., World Handbook of Political and Social Indicators* (New Haven, 1964), p. 323. Also see Alker's discussion of the "Universal Fallacy" and the "contextual fallacy" in his: *Mathematics and Politics* (New York, 1965), pp. 101–106; and the discussion of "interaction effects" in Hugh Donald Forbes and Edward R. Tufte, "A Note of Caution in Causal Modelling," this REVIEW (December, 1968), 1261–1262.

that the objectionable tone like that exhibited throughout Mr. Ashcraft's attack on my *The Liberal Politics of John Locke* (this REVIEW, March, 1969, pp. 191–192) might in future induce the Editor to check whether such a tone does not indicate the libelous character of a review.

1. The reviewer states the absence of "a defensible (historical) definition of liberalism." Even if my treatment on pp. 17–26 of "the complexity" of and "the misapprehensions about liberal theory" (*Lib. Pol.*, pp. 26, 21), were not a contribution towards a re-definition of liberalism, my view of the full picture of liberalism emerges quite clearly since throughout the book I relate each of the components of Locke's politics to accepted notions about the liberal tradition. Ashcraft's slanted choice of quotations is sufficient evidence against his denial of the fact.

2. In his article, "Locke's State of Nature: Fact or Fiction?" (this REVIEW, Sept., 1968, p. 915), Ashcraft offers views on empirical and traditional theory which I, too, express—and apply —in my book. Yet, he completely misconstrues my view on the affinities between "operative democratic theory and Locke" (*Lib. Pol.*, p. 301). He disregards my explanation that, if empirical theory shows "that the democratic process is not as democratic as ideology would have it," Locke was no democrat in the first place (p. 302). Although I refer to Dahl, Kaplan and Laswell (pp. 285, 293) in connection with what remains important in democratic procedures, Ashcraft maintains that from my references to these scholars (and Easton) it follows that they are "the true sons of liberalism." What the reviewer seems to have in mind is liberalism that *inter alia* would not exclude "rule by a Supreme Court or a Poohbah."

3. In all his statements, including those on executive prerogatives, he overlooks that especially throughout part III I make it clear that Locke "is the harbinger of a liberal constitutionalism which is stricter and more unqualified than the constitutionalism with which he was satisfied" (p. 372). Thus, in his derision of what I associate with "'liberal' regimes," Ashcraft fails to take notice of the historical perspective in which I express on p. 293 the view on the adjustability of the liberal principle of the sharing of power to "elitist, authoritarian and extra-constitutional notions." My central thesis that, in denying general suffrage, Locke leaves the people only the right of extra-constitutional dissent, is historically hardly surprising, and the reviewer's fragmented quotations are intentionally misleading. The account of my interpretation of Locke's theory of popular consent—and of other topics—given in the *Times Literary Supplement* of February 13, 1969, shows that my way of interpretation is no hindrance to the accurate evaluation of its contents.

4. As an unprejudiced reading of pp. 32–33 will confirm, I do not refer to the controversies of contemporaries to justify disregard of historical evidence and contemporaneous writings. Detailed comparisons concerning property can be found in Chapter VI. Elsewhere, too, I have evaluated Locke's views in relation to other thinkers (especially Filmer) and to contemporaneous practices. I have also shown that Locke himself viewed issues in historical categories and perspectives, especially one-man rule.

5. The reviewer equally misleads the reader in producing one sentence bearing on a threadbare aspect of economic liberalism, while keeping silent on my attempts to reassess the relationship in the *Treatises* between property and politics and to highlight its principles which permit government intervention, and even a welfare policy, although in practice Locke was not prepared to recommend it. (Chapter VI, 4.)

6. To offer the so far most detailed analysis of Locke's "mature political thought as expressed in the *Treatises*" (*Lib. Pol.*, p. 40), would not seem to be an improper limitation if it distorted or added nothing to our understanding of one of the classics of political thought, or if the analysis were entirely unrelated to the state of political science in our time. Ashcraft's objections are the less convincing since in his "Locke's State of Nature," he does not make a single point which is relevant to Locke's political thought and which the *Treatises* could not bear out. He does not improve his case by clamouring for the reasons of Locke's "change of heart" about revolution, as if Cranston had not broken new ground and Laslett added more emphasis to what follows in this respect from Locke's association with Shaftesbury. Ashcraft does not mention my references to the association in my treatment of Locke's revolutionism (*Lib. Pol.*, pp. 36, 312–13, 364), I do also not ignore or reject the evidence of earlier and other works of Locke when it differs from my reading of the *Treatises* but in these cases I try to explain the difference or I suggest a change of mind (*Lib. Pol.* pp. 152 and 276).

7. Bits of quotations torn out of context are so arranged by the reviewer as to suggest that to distinguish between various senses in which Locke used the notion of the state of nature attests by itself confusion. Ashcraft himself speaks in his article of "the three possible states of nature" (p. 901). This highlights what is essentially wrong with Ashcraft's attitude.

Not all points in his article are different from mine. Yet he refrains from registering any agreement, nor does he dedicate any of the roughly

1200 words of his review to *proving* one single instance where I misread Locke, as distinct from simply ruling, for instance, against the distinction between rebellion and revolution, noted also by other scholars (cf. *Lib. Pol.* note 44, p. 316), or against that between "absolute" and "arbitrary" power. His failure to express agreement or prove a misreading accords with his failure to approximate in his article a decent proportion between the mention of other scholars and the reproduction of their views. (Examples supplied to the Editor.) Ashcraft does not give the slightest indication of what his conclusion owes and adds to existing interpretations. It is no novelty to evaluate Locke's state of nature as "an historical and a moral description of human existence" (p. 898) and to identify the second description as "a critique of existing society by indicating the legal and moral boundaries of political relationships" (p. 914). Yolton and Polin (who mention also Lamprecht) speak of "a normative device" and of "un état normatif," Strauss and Laslett say the same in other words. (References in *Lib. Pol.*, notes 36–37, p. 99 and note 2, p. 83).

Ashcraft's inability or unwillingness to give other scholars' works their due explains the nature of his conclusion that, applied to my book, my own criticism of an unhistorical attitude should prove "suicidal." This wishful thinking reflects itself in the method not to disprove but to cut to measure quotations bearing on a fraction of the topics the book deals with, or rather, like "conquerors' swords . . . cut up . . . by the roots, and mangle . . . to pieces," to adapt Locke's words (II, 211) to the case in hand.

M. SELIGER
The Hebrew University of Jerusalem

TO THE EDITOR:

Every author is, in my opinion, entitled to present an intelligent, clear, and persuasive reply to a critical review of his work. I see no reason why Professor Seliger's failure to avail himself of that privilege necessitates my engaging in polemical argument with him. In addition to the fair treatment of a work owed to the author, a reviewer has an obligation to the reader to advise him on the merits of the book. Given the number of books published annually, the limitations of an individual's reading time, and three careful readings of Professor Seliger's book, I advised the reader that he could better employ his time than by groping his way through the fog-bound thinking of the author.

Aside from the specific textual criticisms mentioned in my review, I pointed out that Seliger had chosen to disregard (a) more than thirty volumes of Locke's correspondence, journals, and manuscripts, (b) the majority of Locke's published writings, (c) numerous works by seventeenth-century writers important to Locke's political thought, and (d) the historical context of events which shaped Lockean ideas. The result is that Seliger set out to write a book on Locke with a seriously inadequate knowledge of his subject and virtually no knowledge of the seventeenth century in which Locke lived. Instead, Seliger throws a few scattered pieces of Locke's thought into a cauldron, and I suggested that from such intellectual alchemy few golden truths were likely to emerge. If the reader is persuaded by Seliger's reply that these defects are irrelevant, he is free to disregard my advice and read the book.

However, in response to Professor Seliger's rather strange notion of scholarship, viz., that original sources may be disregarded with impunity, but secondary sources should be meticulously cited (point 7), I will glady recommend an excellent secondary source on Locke to the reader; namely, Mr. John Dunn's *The Political Thought of John Locke* (Cambridge Press, 1969). As to Seliger's compaints about the brevity of my quotations from his work, I would willingly have provided further illustrations of his confusion, but my space was limited. Professor Seliger had 372 pages to state his case; I was allowed 1000 words. That is a little like trying to cure a diseased elephant with a sugar cube.

ON MODELS AND THE FRENCH POLITICAL SYSTEM:

Commentary on Duncan MacRae Jr.'s *Parliament, Parties, and Society in France 1946–1958*[1]

HOWARD ROSENTHAL
Carnegie-Mellon University

Without exaggeration, it can be stated that the study of French politics has witnessed a certain *immobilisme* in the past half century. Duncan MacRae Jr.'s *Parliament, Parties, and Society in France 1946–1958* marks an important turning point in the application of quantitative methods, specifically in the use of scaling and regression models. In analyzing this commendable work, I attempt to indicate what I believe are nevertheless more appropriate methodological strategies for the study of the French political system. Questions of method, in turn, are paramount to an evaluation of MacRae's substantive interpretations. Insofar as MacRae uses techniques that are being increasingly applied in political science and sociology, this essay may prove of interest to those with more general methodological interests.

The measure of *immobilisme* is that we must return to Siegfried's *Tableau Politique de la France de l'Ouest* (1913!) to find a major innovation along scientific lines.[2] To be sure, the postwar period has not missed "wise" men (Aron, Duverger, Fauvet, Goguel, Hoffmann, Leites, Leuthy, Williams, etc.) on both sides of the Atlantic. But their insights rarely represent theories or models that express skills and techniques required for empirical replication.[3] Some of us will see a certain opening to the study of social systems and authority relations. However, the breach has been small. Wylie's perceptive observations have not led to rigorous analysis. While the speculative conclusions of Crozier's study of the bureaucratic system have interested political scientists, they have failed to adapt his brilliant empirical strategies to the study of the political system. Similarly, Boudon and Davidovitch's simulation of the minor judiciary has not been followed in political science.[4]

Of course, public opinion surveys are an innovation. While students of politics have an obligation to the first pollsters in France, particularly Stoetzel, it must be regretted that polls have been so heavily treated by simple enumeration (marginals and cross-tabulations), a device inherent in Siegfried's work even if applied to aggregate data.

To claim total *immobilisme* would be course be wrong. New methodology exists in works like Converse's analysis of the spatial distribution of party preferences.[5] Nevertheless, the record is far from brilliant.

Against this background, MacRae's attempt to provide a comprehensive analysis of the political system of the Fourth Republic represents a breakthrough.

MacRae's central concern is the most salient aspect of the Fourth Republic: cabinet instability. His thesis is that cabinet instability existed despite a consensual system among the *ministrables* of the inner political club. The *ministrables* tended to support cabinets on critical roll-call votes and managed to take defensive action in thwarting three challenging "surge" movements, Gaullism, Mendesism, and Poujadism. Nevertheless, this club could not form lasting coalitions capable of positive action in many domains, particularly the fatal Algerian situation. Instead, unstable government occurred.

This instability resulted, in MacRae's view, largely from pressures put upon deputies by *ideological* party militants. These pressures broke the leadership consensus by either dividing parties

[1] St. Martin's Press, New York, McMillan & Co., London, 1967, xiii + 375 pp. Further unreferenced page numbers refer to this work.

[2] Second edition, Armand Colin, Paris, 1965.

[3] The exceptions are disappointing. Thus, Goguel has basically continued the Siegfried tradition without modification. Leites, who brilliantly draws attention to the psychic world of deputies, fails to indicate how he samples language and fails to relate the psychic world to other influences such as constituency pressures.

[4] Raymond Boudon, *L'Analyse Mathematique des Faits Sociaux*, Paris, Plon, 1966.

[5] Authors mentioned above and not cited are referenced in MacRae's bibliography.

internally in National Assembly votes or, in the case of the Socialists, a party with relatively disciplined voting, forcing party leadership to desert the governing coalition. These ideological defections might have been acceptable were it not that generally one-third of the Assembly votes were "unavailable" to the central consensus.

The unavailable votes were produced by election outcomes. Although voters were, MacRae argues, even less ideological and politicized than those in the United States, the governing parties could not enlarge upon their clientele since France's social divisions were constrained by a vertical communications system. Consequently, each of the stable parties aimed its communications at a small range of voters. The Communists, the major bloc of unavailable votes, also had a specific clientele. Shifts in opinion were channeled into the "surge" movements cutting across social cleavages to add to the unavailable votes. While the social cleavages responsible for voting behavior were rather unrelated to the ideologies of militants, both factors contributed to cabinet instability.

MacRae's thesis, it should be noted, has no explicit concept of a "rational" deputy: one who is trying to meet various aspiration levels of political power such as reelection and cabinet status. In fact, *Parliament, Parties, and Society* rejects the hypothesis that instability resulted because the *ministrables* themselves engaged in gaming behavior designed to further their personal ambitions.

The strength of MacRae's work lies in his effort to link the Parliamentary system to the behavior of voters and militants. The latter category is the book's weakest link, for little empirical research is reported. MacRae infers the ideological character of militants only from the high levels of party membership and partisan political activity in France and from descriptive reports. Voters are studied through analysis of survey data and multiple regression analysis of election results. Finally, the book's major empirical work is a scale analysis of roll-call votes in the Assembly.[6]

The scale analysis is carefully done and takes its place beside MacRae's earlier work on the American Congress.[7]

In the present work, MacRae has computed separate scales for each of the major parliamentary groups for each legislature. For a given group, roll-calls where the group had less than 90% consensus were considered. MacRae's interpretations of most of the scales is that they are "issue-specific." Consequently, he sees roll-call voting as being organized along ideological patterns. In applying scale analysis to roll-call voting, MacRae has made a major innovation in the study of parliamentary bodies.

The usefulness of this innovation and the remainder of MacRae's analysis is aptly demonstrated by his treatment of the religious issue. Most observers simply relate greatly attenuated Catholic-laic antagonisms. Leites very much ridicules their importance.[8] A much more precise and correct analysis of the religious question is available from MacRae's work.

As for voters, MacRae shows that religiousity remained important, perhaps foremost, among the divisions that rigidified party clienteles and led to the unstable "political arithmetic" of the Assembly.[9] MacRae also argues that the religious question was more important locally than at the national level. Consequently, while deputies may have taken a consensual approach, they may have been pressured by militants, eg. public school teachers, into more rigid positions.[10] Through scale analysis, MacRae shows how Radicals were consistently split on this issue. Even more critical was the Socialists' total opposition to the bills providing funds for church

[6] The scales represent heuristic clusterings of roll-calls. All items in a scale have Yule's Q coefficients of .8 or better with one another. While better scaling procedures, particularly multidimensional scaling, might now be available, I present no critique on this topic given the development of data processing at the time MacRae carried out his research. Also, while MacRae largely selected roll-calls on the basis of *L'Année Politique* and while a better selection might have been made, I assume the improvement would have had only a marginal impact on the results.

[9] This finding is held subject to the reservations about the multiple regression analysis made below. On the continued importance of religious practice for voting behavior, see Howard Rosenthal, "The Popularity of Charles de Gaulle: Findings from Archive-Based Research," *Public Opinion Quarterly,* Summer, 1967.

[10] Specific data on such local pressures is now available from a survey of Fourth Republic politicians conducted by the French Institute of Public Opinion (IFOP). See Guy Michelat and Howard Rosenthal, "Studies of Electoral Coalitions in the Fourth Republic," Graduate School of Industrial Administration, Carnegie-Mellon University, mimeo. 1968.

schools passed under the Pleven government in the Second Legislature. This defeat likely influenced those in the party who forced their consensual leader, Guy Mollet, to bring about Pleven's fall. Thus, both directly and indirectly, religious matters had real import for Fourth Republic politics.

The religious question clearly indicates the utility of MacRae's modes of analysis. He also adds to our knowledge of the degree of imbalance between shifts in governments and their policies and shifts in public opinion; the types of issues that divided the parties; and several other substantive points. As to his more general hypotheses about cabinet instability, if the elements of his view have been advanced in the past, less analytical writers are far from a consensus. Thus, Fauvet and Leites have taken opposing views regarding the strength of the influence of ideology. I would suggest that MacRae's interpretation is correct: ideology counted, mass social cleavages counted, and a consensus operated among the *ministrables*. On the other hand, MacRae's picture is far from complete; other factors, including personal ambitions of deputies, may well have influenced cabinet instability. This lack of completeness or balance—which is part of the inherent approximation of research and which does not suggest that one refrain from giving this book a careful reading—leads to a number of criticisms. Hopefully these criticisms constitute useful research strategy. While, for reasons of brevity, these criticisms are focused upon MacRae's scaling analysis of roll-call votes and regression analysis of party voting, the criticisms would apply to the analysis of social cleavages and other topics considered by MacRae.

Simply reinterpreting MacRae's roll-call analysis in a different framework raises some doubt as to his emphasis on ideological factors in the fall of cabinets. Two points must be considered: which deputies were scaled and which roll-calls were scaled.

As to the deputies, among the non-Communists, about 50 were excluded from scaling analysis for the First Legislature and over 100 in the Third.[11] In the Second Legislature, the dissident Gaullists, the ARS, were not scaled.

The ARS began to break with De Gaulle's RPF by supporting Pinay, the first Moderate premier since the Liberation. Perhaps the ARS dissidence was precipitated by support for Pinay's conservative policies, but the non-ideological issue of opportunistic participation in the spoils of Fourth Republic government had long been latent within the RPF. The ARS was rewarded with cabinet participation in the subsequent Mayer government while the loyal Gaullists waited until Laniel in order to join the club.

It is not denied that the ARS members were on the "Right," with respect both to the entire political spectrum and to the Gaullist movement. Their conservatism may explain why they deserted De Gaulle over Pinay rather than Pleven or Faure, but it does not explain why they failed to vote the investiture of another Moderate, Petsche, at the beginning of the Legislature. It can be advanced that the ARS simply wanted to ride the winning tide of Gaullism; when Gaullism lost its force, as good "gamesmen" they sought better fortunes.

Similarly, the unscaled deputies in the other Legislatures may well have been maneuvering with personal ambition foremost in mind. Some of them were gentlemen who shifted their party identification while others belonged to small parties. At the margin, their votes were important, and they must be studied before formulating any conclusions about the Assembly.

The question of omitted deputies, however, is probably less important than that of omitted roll-calls. In fact, a large proportion were not scaled. In only one case, that of First Legislature Moderates, where 28% of votes involving dissidence within the party did not enter scales, does MacRae provide precise information on this point.[12] Elsewhere, the proportion seems lower; thus, of divided MRP votes, about 78%, 51%, and 86% were not scaled in the First, Second, and Third Legislatures, respectively.[13]

What interpretation can be placed on these

[11] These figures are estimates made from various tables as MacRae does not give precise figures. Even if separate analyses were carried out by party, it would have been useful to have a scale analysis of all deputies to treat the problem of unscaled deputies. Such an analysis would also have presented a dimensional portrait of the parties. Consequently, one would have been able to handle more precisely the question of the left-right position of the Radical, MRP, Moderate, and Gaullist blocs. One could also relate such a "mapping" to the various government coalitions. Michael Leiserson has made an initial attempt in this direction. See his "Political Coalitions," unpublished doctoral dissertation, Yale University, 1966.

[12] P. 96. On p. 181, MacRae unfortunately leaves the impression that only unanimity was a reason for a vote not being scaled. Such is obviously not the case; many roll-calls were not scaled because they did not fit into a cluster.

[13] Based on Tables 3.6, p. 56; 4.5, p. 104; 5.5, pp. 146–147; 6.5, p. 174.

roll-calls that were not shown to be strongly related to general patterns of party division? Rarely, as in the case of the school aid question in the Third Legislature, they represent an important division that was infrequently put to a vote. More frequently, these roll-calls may have represented different dimensions for different deputies. For example, one deputy might interpret a roll-call as "European" while another sees it as "economic." Even in this case, such differential perceptions would hardly suggest widely shared ideological structures. A third possibility is specific questions of interest, sugar beets, etc. But such roll-calls would certainly show that deputies and militants are pursuing non-ideological interests of economic, electoral, and other types. Finally, the non-scaled roll-calls can indicate specific gaming maneuvers within the coalition system. (However, the "ideological" explanation might still be retained through multivariate techniques not used by MacRae. See the remarks on methodology, below.)

For these numerous non-scaled roll-calls, it is especially important to look at their distribution over roll-calls of obvious importance to government instability. Here I include roll-calls where a premier is invested or rejected, where his cabinet is approved or rejected, and where he falls or chooses to resign.[14] Since party divisions on these roll-calls are presented graphically by MacRae, we can only gauge approximately whether a sufficient proportion of the members (10%) voted in such a way that MacRae treated the vote as expressing dissidence.[15]

On roughly 111 occasions a scaled group—Socialists, Moderates, MRP, and Radicals plus UDSR in all three Legislatures, the Gaullist URAS in the Second—divided on these critical votes. Since only 39% of these divisions entered into scales, conceivably a majority of the divisions expressed ample "gaming." The pattern holds even for the relatively "ideological" groups, the MRP and the Gaullists. Only 8 of 19 MRP divisions and 3 of 11 for the Gaullists were scaled.[16]

These aggregate results must be focused in terms of the history of coalition formation and breakdown. For the First Legislature, MacRae rightly argues that the Socialists were responsible for the fall of cabinets. In turn, the Socialists were split internally on ideological lines. But one needs more information on the extent to which ideology was more than a symbolic overlay for power struggles within the party, Mollet being particularly concerned with his personal position. Furthermore, MacRae himself raises the possibility of dissent within the party coming from conditions of electoral competition within constituencies as well as from the personal beliefs of militants.[17]

In addition to the Socialists, one ought to look at the Radicals whose support was generally essential to any First Legislature coalition. A mark of Radical power in coalition formation was their ability to receive cabinet posts in greater proportion than the number of Radical votes supporting the cabinet.

At the beginning of the Fourth Republic, after uniting on a series of investiture votes, the Radicals split on Ramadier's fall and Blum's subsequent investiture attempt. Then unity was refound on the investiture of Schuman but readily lost when his cabinet was presented five days later. The first two of these divisions are not part of any scale. The division over Schuman belongs to a scale (I-2 Marie-Queuille) that is not particularly related to specific issues but includes all investiture and cabinet votes until the vote on Queuille's first cabinet. All scale items fall in the period November, 1947, July, 1949. Thus, it might be suggested that Ramadier's fall marked the beginning of coalition bargaining that yielded a relatively stable pattern with the Schuman cabinet.

Nevertheless, the pattern showed signs of collapse over Schuman's fall, which was not scaled. After Queuille's first investiture, the Radicals could not be scaled on any of the "critical" votes in the remainder of the Legislature. If united on investitures, dividing only over Mollet and Pleven, the party split, and *split differently* at the end of the final three governments to fall Queuille, Bidault, and Pleven.[18]

This overview of Radical voting suggests that the Radicals engaged in coalition in-fighting MacRae's scale analysis has the merit of isolating a period when alignments were relatively stable. It would be possible for the most success-

[14] This categorization omits critical roll-calls during the life-time of a cabinet. Such roll-calls, which could be spotted by more detailed research and which would present great interest in the general study of instability, are not necessary to the points made here.

[15] Although some roll-calls which appear on the graphs to contain 10% dissidence may not have been scaled because some of the dissidents did not stay within the group for the whole Legislature, such dissidents, as suggested above, bear close watching for "gaming" behavior.

[16] In the entire Fourth Republic, the Socialists divided on only two "critical" votes, the Thorez and De Gaulle investitures.

[17] P. 292.

[18] Queuille's final government simply terminated with the elections for the Second Legislature.

ful bargainers to have paid for their rewards by supporting the government while the least successful attempted to demonstrate their power by casting negative votes. From this viewpoint, which still permits gaming, finding an association between *ministrable* status and support for cabinets is not surprising.

As for the other parties, the Right was heavily divided throughout the Legislature, splitting on 24 of the 31 "critical" roll-calls. When these Moderates split on a roll-call that was scaled, they may have done so along ideological lines, for 7 of the 10 such roll-calls belonged to their general left-right scale (I-1). However, 14 roll-calls were not found in any scale. Similarly, when the MRP divided it did not do so in ways that led to scaling (5 of 6 cases). In summary, even if we go so far as to admit that First Legislature governments fell from the Socialists' ideological disputes, instability may also have resulted from gaming over the composition of governments.

In the Second Legislature, the MRP was more divided than in the First although these divisions may have reflected splits on issues rather than coalition maneuvers as 7 of the 11 splits were scaled. Yet the scaled roll-calls were scattered about four scales, the major contrast being between votes on Mendès-France and votes on other premiers. In turn, MacRae admits that Mendès was fought as much for his unwillingness to abide by the rules of the club as for ideological reasons.

The Moderates were less divided than in the First Legislature, but 7 of their 11 divisions could not be scaled. The two scaled votes on Mendès investiture seemed to be specific reactions to Mendès while the fall of Mendès and of Pleven were related to key foreign policy issues.

Continued suggestion of Radical gaming comes from 9 roll-calls that could not be scaled. If three scaled roll-calls bear some relation to issues, three others (Mendès' fall and Faure's second investiture and fall) are related to a specific coalition struggle stemming from the club's unwillingness to submit to the popular Mendès.

For the Second Legislature, however, MacRae rests his case on the Gaullists, who caused the fall of most governments. If the eventual members of the URAS were unified until Mayer's fall, thereafter they seemed to have the usual ambitions of the system. After Mayer's fall there was a prolonged crisis of one month when four candidates, Reynaud, Mendès, Bidault, and Marie, all lost investiture votes. Although the Gaullists divided on all of these votes, none was found in a scale. The three votes on Laniel were scaled, but on three distinct scales, one of which was simply titled "disaffection from Laniel"; thus, gaming can not be ruled out here. Finally, none of the succeeding divisions on Mendès, Pineau, and Faure could be scaled. Consequently, for critical votes, MacRae's results do not suggest that Gaullist splits were primarily ideological but rather that without De Gaulle there is no Gaullism.

In fact, MacRae's conclusions concerning Gaullism appear to follow more from preconception than from empirical research. When, for example, he attempts to relate roll-call voting to constituency factors, instead of a set of research results, we find the assertion:

> We should expect the constituency relations of the Gaullists, as inferred from their scale positions after they began dividing on roll-calls, to have been loose. In its early years, the Gaullist movement was ideological, and the most enthusiastic Gaullists took their stands as a matter of personal conviction than because they came from "Gaullist districts"—or conformed to them.[19]

In a recent essay, however, I have indicated that the Gaullist scales are rather strongly related to a measure of electoral interest in the constituencies. I have also shown that measures of electoral interest are closely related to Gaullist choices in electoral coalitions under the *apparentement* system.[20] These findings suggest

[19] P. 299.

[20] Howard Rosenthal, "The Electoral Politics of Gaullists in the Fourth French Republic: Ideology or Constituency Interest?", this *Review*, June, 1969, pp. 476–487.

Other limitations of MacRae's analysis of constituency relations are: (1) While he suggests that party militants limited bargaining at the local level (pp. 11, 289–302), study of *apparentement* alliances for the 1951 elections shows that the "highly organized" MRP formed the most coalitions. Another type of coalition, joint lists among two or more parties, in turn seems as related to the size of their vote as to their membership ratios. See Howard Rosenthal, "Voting and Coalition Models in Election Simulation," in William Coplin, ed., *Simulation and the Study of Politics*, Chicago, Markham Press, 1968; (2) Generally, the treatment of the role of electoral interest vs. that of ideology is too superficial. Thus, MacRae interprets (p. 176) an association between scales specific to issues and scales specific to cabinets as supporting evidence for the lack of a game and infers that high specificity was a characteristic of "ideological" parties. A "perfect" data point in this respect is represented by the Socialists' unique First Legislature scale which was entirely specific to one cabinet and to one issue, the electoral law. Yet MacRae only hurriedly investigates (pp. 290–

that non-ideological considerations are important to the analysis of Gaullism, even as early as 1951.

Similarly, MacRae finds that Gaullism as a "surge" movement had "politically unskilled" leaders.[21] Further on, although forced to note that the Gaullist parliamentary group indeed tended to come from skilled occupational groups, he argues, "they lacked the skills of negotiation and compromise."[22] This contention seems to revolve about De Gaulle's failure to come to power before 1958.[23] But are we now to believe that in the Fifth Republic the Gaullists are skilled and the unsuccessful men of the Fourth unskilled? By rejecting the Fourth Republic, the Gaullists had to appear as uncompromising. At least their local coalition choices were well in keeping with the skill of electoral rationality. Thus, it seems dubious that the Gaullists were a group of unskilled ideologues who caused the instability of the Second Legislature.[24]

The Third Legislature, in contrast, comes closest to supporting MacRae's emphasis on ideology. The Moderates, who were primarily responsible for the fall of governments in this brief legislature, were divided at the fall of Mollet, Bourgès-Maunoury, and Gaillard. The latter two votes as well as Pflimlin's investiture on the *treize mai* belong to two scales dealing with the Algerian issue, and Mollet's fall is more related to the "Algeria" scale than any other.[25]

Algeria was also important for the Radicals. Although the vote ending Mollet's reign fell on the Europe scale, both Bourgès and Gaillard fell on two highly associated scales that MacRae labelled "Mendesism" but could as well go under "Algeria."

Still, gaming was perhaps not absent, for the Moderate votes on three investitures and the Radical votes on four were not members of scales. While the MRP only divided on two investiture votes among the "critical" roll-calls, neither of these entered the single MRP scale for the Legislature. It is perhaps of consequence that the Moderates and MRP, excluded from the first two cabinets, participated in the Gaillard government. Furthermore, as MacRae himself contends that "a more fundamental reason for the Moderates' defection [from Mollet] was their feeling of growing strength in the country," ideological motivations were certainly not unrelated to tactical considerations.[26]

If the foregoing successfully suggests that ideology's role in cabinet instability may not be as secure as MacRae would like us to believe, doubts arise regarding not only the interpretation MacRae gave his results but also the methodology used to obtain the results. In fact, the foregoing reinterpretation must be regarded as provisional, given MacRae's methodological structure.

In effect, MacRae initiated scale analysis of all divided roll-calls and afterwards inspected the results in relation to the fall of cabinets. It would perhaps be preferable to treat the critical votes as a series of dependent variables. Then, in terms of roll-calls, one could see what other votes clustered with each critical vote. In MacRae's heuristic, a critical vote is unfortunately excluded from scaling if it fails the necessary association level for one or two votes in an existing cluster. The method suggested here would permit focusing directly on the correlates of each critical vote.

Another alternative and perhaps superior strategy would be to perform a scale analysis on all roll-calls except critical roll-calls and to then develop multivariate measures of association between the scales and the critical roll-calls. Within such a model, one could also accommodate measures relative to past critical votes, to the constituencies, to ministerial rewards, etc.[27]

291) the extent to which Socialists were simply voting their electoral interests on this issue. While awaiting such an examination, an alternative proposition can be advanced; namely, that since specificity seems to be related to the number of votes scaled, it is primarily related to the extent of party discipline rather than ideology. Since, when discipline breaks down, it may tend to do so during a brief period of time over a single question (which may be either ideological or tactical), cabinet and issue specificity may be associated. Hence, neither of these measures by themselves can be expected to reveal much about either ideology or coalition formation.

[21] P. 9.

[22] P. 53 and n.35, p. 63.

[23] Pp. 308, 313–315.

[24] Similarly, it is doubtful that the Mendesists were unskilled.

[25] P. 169.

[26] P. 161.

[27] With respect to ministerial rewards, MacRae has only considered differences in support between *ministrables* and non-*ministrables*. He thus has no measures on those who aimed at office but were unsuccessful. He also did not report on the relationship of voting to the allocation of posts over time.

In any case, his inference of a consensual system from ministrable support for cabinets can be questioned in that examination of Table 7.2 (p. 187) discloses that the association between *ministrable* status and cabinet support was strong only for the First Legislature. Furthermore, on p. 193

Such a strategy would give a more comprehensive view of behavior on critical votes and, in particular, it would remove much of the vagueness now present concerning the non-scaled votes.

The argument for a methodology centered about dependent variables also applies to MacRae's regression analysis of the geographic variation of the vote over the French departments.[28] Again, instead of creating an appropriate model for each dependent variable, he uniformly applies the same set of four independent variables to seventeen voting outcomes. For the stable parties, this method is moderately successful with "explained" variance (in terms of squared Pearson correlations) ranging from 27% to 52%. Much lower levels were obtained for the Gaullist gain in 1951 (26%) and the Poujadist vote in 1956 (19%).

Even if such a technique has comparative interest, its danger is that, if the model is incorrectly specified, one will generate improper interpretations from the resulting coefficients. An example is available by comparing a more elaborate study of Poujadism to that of MacRae.[29]

In the former, first a simple regression was run using "ruralism" (defined as per cent of the labor force in non-agricultural occupations) plus six other independent variables: % independent non-agricultural proprietors; % Communist vote in the 1951 elections; wine-growers as % of male labor force; home distillers as % of male labor force; automobile registration per capita; North-South based on the Vichy occupation line. As a simple regression, there is an adjusted squared multiple correlation of .43 as against .19 for MacRae.[30] While MacRae reports "ruralism" (which he defines somewhat differently) as the most important correlate of Poujadism, in the seven variable analysis, "ruralism" has no "significant" relationship to the Poujadist vote, significant coefficients being found only for home distillers, automobiles, and North-South.

To go one step further toward proper specification, another seven variable model was run incorporating a number of detailed hypotheses about the geographic variation of the Poujadist vote. While the Communist vote again entered the equation, the Communist vote weighted by Ruralism was introduced to capture the competition between Poujadism and Communism in rural areas. Thus, while the former term had a positive partial correlation with the Poujadist vote, the latter was negatively related. Similarly, the two alcohol variables were multiplied (weighted) by automobiles, expressing the hypothesis that discontent must be related through communications. Finally, automobiles, independent proprietors, and North-South were all weighted by ruralism to express the hypothesis that these effects were strongest in rural areas. This model, in which all coefficients are "significant" has an adjusted squared correlation of .53. Although many elements of this model are mentioned in passing by MacRae, his failure to give them explicit statistical analysis leads to a fragmentary intepretation of Poujadism. His interpretation of other voting phenomenon should also suffer from this tendency to compare associations rather than specify models.

MacRae's preference for general patterns of association may be a deliberate avoidance of complexity as the book has been carefully written to reach those without mathematical knowledge. Following a preface offering some uncomplex "conjectures" that can be "perceived" by the "nonstatistical observer," the book frequently resembles the "wise" man's argument for a particular thesis rather than an attempt to provide a rigorous statement of the measure of multiple influences on complex behavior.[31] Of

---

MacRae incorrectly interprets data in support of his hypothesis:

> For one *ministrable,* Antoine Pinay, there is additional evidence of his support for cabinets of which he was a member. Pinay's friends constituted a well-known group . . . four of the seven are in the top row on Scale II-2. They were somewhat more favorable to the cabinet than other members of the party.

We can hardly believe this since 43 of the total 63 Moderates scaled were also in the top row (see Table 7.4, p. 192).

[28] Actually 82 departments or dioceses, except for the Poujadist vote where there were fewer units. MacRae originally published these results in the *American Journal of Sociology* in 1958. While it may now appear subject to reservations, MacRae's study was undoubtedly instrumental in stimulating the use of multiple regression in French political studies.

[29] See Howard Rosenthal, "Poujade's Voters: Suggestions for the Study of the Social Geography of the New French Politics," Carnegie-Mellon University, Graduate School of Industrial Administration, mimeo., 1968. This study further raises the point that beyond the particular case of "ruralism" discussed below, MacRae did not consider that Poujadism might represent a more complex reaction to modernization than the simple "defense" of *"situations acquises"* (p. 12).

[30] MacRae does not indicate whether his correlations are adjusted.

[31] P. vii. The lack of rigor seems especially true for the comparisons MacRae draws between France

course, although "nonstatistical observers" may think in black and white, one need not research and write for such an audience.

Beyond questions of audience, the methodological problems of *Parliament, Parties, and Society* reflect a lack of theoretical underpinnings. While there is some reference to sociological theory (albeit in such non-operational terms as "structure," "norm," "status," and "ideology"), there are no references to what might be termed the "neo-rational" school of political science. No mention, for example, is made of the Simon-March-Cyert work on organizations, and, particularly, incrementalism.[32] Yet their conceptual framework has heavily influenced the work of Boudon and Crozier in France and, to speak specifically of a legislative process, the work of Davis, Dempster, and Wildavsky on budgetary processes in the United States.[33] Similarly, there is no reflection of marginalist explanations of voting behavior beginning with Downs nor of the growing interest in coalition theory proceeding from Riker.[34]

To suggest one way in which "neo-rational" thinking is likely to be of help, consider the first proposition MacRae would question: Cabinets tended to be brought down by the operation of a parliamentary game in which prospective ministers were the center of opposition.[35]

MacRae's main attack on this "conjecture" comes from finding that *ministrables* tended to support cabinets more than non-*ministrables*. But setting up a "conjecture" and dealing with it so simply is a quite narrow tactic. Surely one would be better to assume that cabinet status was an important goal for at least some deputies —MacRae does not indicate the contrary. How, one would ask, did deputies implement this goal? Once that question is answered, one could investigate the consequences of such behavior for cabinet instability.

One would also investigate how the cabinet status goal interacts with other goals, particularly reelection. If, for example, the *ministrables* have more secure electoral bases that non-*ministrables*, they can afford to support the cabinet even when it might mean losing some voter support. This would generate differential levels of support for the government without excluding "gaming" at opportune junctures.

Goal interactions should be related to the characteristics of roll-calls. Among the possibilities: (1) investiture votes, which focus on little-known personalities, may be less salient in the constituencies than votes on intense issues that lead to the fall of governments. Consequently, one might expect "gaming" for the cabinet status goal to be more important on the former. (2) On matters where a positive vote and a negative vote would have equal effect on the reelection goal, a deputy would be relatively free to vote according to personal ideology. (3) Even if a deputy would be inclined, *ceteris paribus*, to vote in line with his constituency interest, his vote is likely to be influenced by his past support for the current government.

The type of approach that has just been suggested can be extended to the other "conjectures" considered by MacRae. In general, we need behavioral models of the mass "market" of voters, party organizations, and the Assembly itself. Without having achieved such objectives MacRae has prompted their pursual.

---

and the United States. The qualitative differences between, say, lack of white-black communication in the U.S. and *ouvrier-patron* in France are so important that it is very risky to rely on the types of statistical tables now available for international comparisons and thereby establish such propositions as, "In personal relations and social structure, France is more divided than the United States" (p. 6).

BOOK REVIEWS

Public Policymaking Reexamined. By Yehezkel Dror. (San Francisco: Chandler Publishing Company, 1968. Pp. 370.) *Political Science and Public Policy.* Ed. by Austin Ranney. (Chicago: Markham Publishing Company, 1968. Pp. 287.

TWO VIEWS

"Public policy" is a historic concern of political scientists. Two books that reflect current concerns with policy are *Public Policymaking Reexamined* by Yehezkel Dror and *Political Science and Public Policy* edited by Austin Ranney.

It is not very often that we see a book like Yehezkel Dror's *Public Policy-making Reexamined.* Dror offers a great leap forward in the analysis of public policy. His scope is huge and his ambition is extensive. He tries to encompass the whole field in this volume, not merely for the sake of description but for the purpose of assessing the present quality of policymaking and proposing major reforms. The book warrants the label "definitive" insofar as it defines a full sweep of concerns that are held in common by political scientists interested in normative *or* behavioral approaches to public policy. Dror does not fill all the segments of this field, however, and some of the gaps raise serious questions about the larger enterprise.

The field that Dror's book defines is "policymaking." This includes the substance of policies that are considered and implemented by governments, the structures and behaviors—both official and private—that combine to make policy, plus other structures and behaviors that shape and modify policymaking procedures.

The breadth of Dror's book ranges from first principles through empirical findings, a major reform proposal, and detailed prescriptions. The most elementary of Dror's "first principles" is his distinction between homo sapiens and the primates on the basis of the ability to "make conscious and rational decisions, at least part of the time." His concern for empirical findings is more often asserted than demonstrated; he excuses himself from paying greater attention by alleging inadequacies in the literature.

At best, the empiric study of policymaking is just now emerging. A significant and increasing amount of work is being done on minor decisions and secondary policies, but most of it suffers from its lack of comprehensive, theoretical frameworks. Very little empiric work is being done on the macrosystem of public policymaking. At present, even suitable research methods are conspicuous by their absence.

At this and other points, Dror should plead his lack of familiarity with much of political science, especially that dealing with American legislatures, legislative-administrative relations, voting and attitudes, and the newer varieties of comparative state and urban policy-analysis. Such authors as David Easton, Richard F. Fenno, John P. Crecine, Warren Miller, Donald Stokes, Heinz Eulau and Thomas R. Dye have contributed far more to our understanding of policymaking than Dror acknowledges.

The central feature of Dror's book is his "optimal model" for policymaking. This is both a standard against which he compares existing modes of policymaking, and the goal of his reforms. Dror is especially critical of those policymaking procedures he calls "muddling through" and "incrementalism." These have insufficient concern for rational assessment and control of policymaking. "The most harmful effect of the incremental-change argument (which denies the possibility that significant improvements could be made in public policymaking by some innovative jumps) is that it paralyzes efforts, and thus tends to be a self-fulfilling prophecy." Dror describes his own model in several places, but qualifies himself often enough to complicate the tasks of identifying and assessing it. The basic features of Dror's model resemble the components of "rational decision-making" that have been abstracted before by Charles Lindblom and others. To his credit, it should be said that Dror accommodates many of the *caveats* pertaining to pure rationality. He recognizes the high costs of information, and admits the need for cutoff points in assessing alternative policies. He concedes the need for "extrarational" components in policymaking, and suggests a pragmatic mixing of political and economic feasibility in the criteria that are used to select the "best" policies from those available. His concern for "extrarationality" in policy-making, a continuing examination of policy-feedback, and the redesign of policymaking in the face of this examination are central features of his proposal. "Extrarationality" appears to be little more than "creativity." It is an ability to leap from empirical evidence about existing concepts and offer a new proposal that will make "progress" in an attack against intractable social, economic

or political difficulties. Dror uses "intuition" and "judgment" to characterize his concept of extrarationality, and shuns the connotations of "mysticism" and "charisma."

The major question about Dror's herculean task concerns its success: Do his proposals fit into the empirical literature about policymaking, and prescribe a set of goals that are consistent with existing knowledge? Because Dror does not give adequate coverage to the empirical literature a reader must evaluate the book partly with his own sense of what is feasible. Indeed, Dror sometimes acknowledges a casual departure from his own understanding of the empirical literature, and thereby shakes the foundation of his own proposals.

> My findings will be based on a survey of both "literary" and scientific literature and on my own subjective impressions . . . I will regard them as being in the range between "suggestive" and "highly probable" . . . I am not going to keep my factual findings and evaluation formally separate. I will present my findings in a concise, generalized form, without paying what would usually be the necessary amount of attention to exceptions, deviations, and subvariations.

As might be expected from this excerpt, a reader occasionally flails at Dror for making an overly-simple assertion, or reaching a specific recommendation with no basis of analysis.

Dror's analysis suffers from his lack of "the necessary amount of attention to exceptions, deviations, and subvariations." In drawing out a model of muddling through and incrementalism as key features in a policymaking system that he wishes to reform, he does not fully explore the opportunities for innovation within incremental procedures. A system that makes changes incrementally might not be stricken with rigor mortis. Just within the recent history of the United States, there have been dramatic changes in public policy toward minority groups, capital punishment, health insurance, and the use of federal resources to support educational programs in both religious and secular schools. While the spending of state and local governments may change according to the routines of incremental budgeting, the "incremental" growth has been continuous and substantial. Between 1963 and 1967, the combined spending of state and local governments (per capita) increased by 33 percent. Dror himself acknowledges that policy situations may lend themselves to strategies of minimal risk or innovation; and if the former should lead to incremental change. Thus, Dror overdraws the conservatism of incrementalism, and then concedes his reform will have room for incremental decision-making. A reader is left with questions that require more specificity than Dror provides. *What are the worst squeak points of incrementalism? What are their implications for the nature of policy? What conditions require the use of incremental or "optimal" policymaking?* These questions require an exhaustive concern with "exceptions, deviations, and subvariations," and not a disregard for details.

The collection edited by Austin Ranney does not lend itself to the thematic analysis applied to Dror's *Public Policy-making Reexamined*. Its original essays treat various aspects of the policy process, but do not reflect a continuing line of reasoning. Partly for this reason, it complements Dror's book. While Dror offers a comprehensive (and somewhat oversimplified) outline of policymaking, Ranney's collection offers many limited essays that reveal the rich variety of questions, theories, data, research techniques and findings in the policy field.

As its title suggests, the collection is meant to identify the contribution of political scientists (qua scientists) to the *understanding* of public policy, and to its *formulation, implementation* and *evaluation*. Its twelve essays suggest the range of talents that political scientists can bring to these tasks: as developers of theoretical frameworks that help identify crucial lines of influence among the features of the policy process; as describers of governmental structures and political behaviors that are likely to affect those who make policy, and inhibit certain kinds of policy proposals; as assessors of specific policies, to determine which interests they benefit, and whether they accomplish the goals which they claim; and as evaluators of reforms proposed for the policymaking process, to identify those features that are likely to arouse antagonism from policymakers., and those features that are likely to have consequences unforeseen by the reformers.

Aaron Wildavsky looks at several policymaking techniques that have been devised, primarily by economists: systems analysis, program budgeting, cost-benefit analysis, and planning-programming-budgeting. He makes some of the arguments that have been identified as "that political scientist's" rebuke of reformers who disregard central features of the political system. He writes that goals are evolved as the products of interactions among participants, and may be submerged within agreements about specific policies. To upset the customary ways of making decisions about goals and policies would threaten important—if informal—mechanisms. Policymakers must protect their reputations and their access to other officials with whom they share governmental authority, and refrain from

offending citizens in ways that might provoke civic discord and undermine the legitimacy of the political system. Although the economists' concern for efficiency in providing services, and their weighing of tangible benefits and costs offer information of great value to the policymaker, their usefulness seems bounded by the "political" considerations that policymakers use to protect themselves from one another.

Ralph Huitt adds more to our understanding of constraints on policymaking in his discussion of "political feasibility." Huitt sees policymakers' use of economic rationality limited by the complexity of their goals and by the decentralized nature of the political system. The simple decision rules associated with planning-programming-budgeting have had relative success in the Defense Department because the goals of that organization are comparatively clear and noncontroversial (deterrence of war, defense of the country, and victory in war). Policy planners in the military may compare alternative policies for their relative costs and benefits, while officials in other units are reluctant to announce the probable long-range accomplishments of their programs in order to avoid conflicts among policymakers who can support specific activities. The decentralized nature of the political system requires policymakers in all units to be sensitive to the demands and constraints imposed on them by others. Huitt has both academic and policymaking experience, and judges that one's definition of political feasibility is an art. "It is a seat-of-the-pants judgment, based on the experience of the person making it." The "cost" questions that Huitt's artist asks himself are: "Will it 'go' on the Hill?" "Will the public buy it?" "Does it have political 'sex appeal?'" Perhaps Huitt is too close to the experience of policymaking to risk generalization. Yet he outlines some of the parameters that bind the policy making artist, and he may contribute to someone else's definition of empirical generalizations.

James W. Davis and Kenneth M. Dolbeare assess the policies of the U.S. Selective Service System by the standards of its official goals, and recommend substitutes for present policy. On the basis of data collected by the Selective Service System, the Defense Department and their own survey of draft boards in Wisconsin, Davis and Dolbeare conclude that the System's goals of "equity" and "efficiency" are not realized by existing (i.e., pre-1967) procedures. The goal of equity fails on account of the high incidence of low-income and black inductees; and the goal of efficiency fails because there are no systematic efforts to define the civilian manpower needs of the country, or meet these needs through the criteria that local boards use to grant deferments. The authors ask if they, *as professional political scientists*, can recommend one policy-alternative over another? They argue that policymaking involves a balance between *assumptions accepted, conditions perceived, goals established, value priorities asserted, means available,* and *effects and by-products considered acceptable.* Further, they claim that scientific research in three of these elements (defining relevant conditions, means available, and effects and by-products produced), will support recommendations. The "fudge factor" in their argument is the notion of scientific analysis that "supports" policy recommendations. They do not claim that the skills of political scientists lead unerringly to one policy-recommendation instead of others. They only *reject* some policies by showing their *inconsistency* with current conditions, means available, or likely effects and by-products. They are less successful in producing unchallengeable recommendations.

In separate papers, Lewis A. Froman, Jr. and Robert H. Salisbury suggest that public policy be used as an independent variable to probe other features of the political system. They depart from the more-typical view of policy: as a dependent variable to be explained by reference to other political, social or economic phenomena. Froman evaluates several conceptions of policy for their potential utility as independent variables, and Salisbury offers some hypotheses about four "types" of policy: distributive, redistributive, regulatory, and self-regulatory. Their principal argument is important: different types of policy are likely to stimulate different kinds of interactions among other features of politics. Although both papers are useful preliminary exercises for research, their theoretical categories are fraught with some of the problems that Froman offers in his own evaluative check-list: mutual exclusivity; validity; reliability; and ease of measurement.

These two books reveal some of the breadth obtainable from a concern with "public policy." Like "decision-making," "group conflict," "political system," and "role," it is a focus that lends itself to many analytical purposes. Even more than these, "policy" offers a link between the work of academic political scientists and the "practitioners" who must formulate and assess substantive policies. Some of what we design for the purpose of understanding the policymaking process may be useful to those who toil as policymakers. Dror, in a section "On Improving Public Policymaking," and several essays of the Ranney collection discuss the formal linkages between academic policy analysis and policymaking. Like other efforts of this kind, however, their recommendations are less than satisfac-

tory. The roles of the academic and the practitioner are basically different. While one strives for more complete (*i.e.*, general) understanding, the other wants specific prescriptions for discrete problems. Yet the policy-oriented political scientist is joined to the policymaker by common concerns. The analytical techniques, and some findings of political scientists may aid the specific concerns of some policymakers. Perhaps the only general recommendation we can offer to the policymaker is that he obtain sophisticated training in policy-oriented political science, and ask for some of the always-elusive time in order to consider his lessons as he evaluates existing policy and formulates new proposals.

IRA SHARKANSKY
University of Wisconsin

It can hardly be doubted that political science (abetted in some cases by other social sciences) is rapidly becoming enamored of the study of policy. The advertisements in any recent issue of this *Review* bear testimony to this. Just glancing at the stack of books that I have accumulated within the last few months I come across such titles (all published in 1968) as *Politics and Policy, The Study of Policy Formation, The Policy Process in American Agriculture, Science Policy and the University, The Policy-Making Process, City Politics and Public Policy,* and *Public Opinion and Public Policy*. Naturally, the quality of work on policy varies greatly. The perspectives and interests of any two social scientists with an avowed policy orientation may be radically different. Fuzzy concepts, irrelevant data, insufficient data, and detailed treatments of boring questions abound. But so do stimulating and fruitful analyses. It seems clear that the rediscovery that politics is, after all, principally about outputs, outcomes, authoritative allocation of values—in short, policy—has produced exhilaration among some of our colleagues. Exhilaration, of course, does not always produce insight but, to state a proposition: the more the exhilaration the greater the chances of insight.

It is most productive to attack the task of commenting on *Public Policymaking Reexamined* and *Political Science and Public Policy* by placing them in the context of the "lessons" they teach about the fruitful study of policy. These lessons come from both the strengths and weaknesses of the books.

Lesson #1

Since "policy" is not a self-explanatory term it needs some clear conceptual discussion. The scope of "policy studies" also requires considerable attention, because it does not define itself. At minimum, distinctions have to be drawn between the study of policy decisions, policy processes, policy statements, policy inputs, policy outputs, policy outcomes, and perhaps, policy arenas or issue-areas. In addition, some distinction needs to be made between policy description, which involves the chronicling of alternatives; policy prescription, which involves the advocacy of alternatives; policy analysis, which involves advice on the choosing of alternatives; and policy theory, which involves the explanation of why certain alternatives are chosen and others are not.

There are useful conceptual formulations scattered throughout these volumes. Austin Ranney's essay in the volume he edited is the best. In a few pages he clearly details the component parts of a "public policy," and distinguishes between policy content, policy process, and policy outcome. Robert Salisbury's essay in the same volume does a particularly useful job of distinguishing between three positions on the meaning of policy (pp. 152–153).

James Rosenau, again in the Ranney volume, argues that the term "policy" is so vague, or at least has been made so by the meanderings of political scientists, that it is not really useful. At least in the foreign policy area he proposes the use of a different concept—the "undertaking"—in order to counter traditional murkiness. The core of this interesting argument follows (p. 222): "An undertaking is conceived to be a course of action that the duly constituted officials of a national society pursue in order to preserve or alter a situation in the international system in such a way that it is consistent with a goal or goals decided upon by them or their predecessors . . . [U]ndertakings, unlike policies and decisions, encompass goals and their implementation. Their distinctive quality is that they focus on what government does, not on how it decides to do it or on what it commits itself to do."

In order to explore all of the important connections between policy and society the scope of political science analysis focusing on public policy has to include inputs, outputs, outcomes, and arenas or issue-areas as well as statements, decisions, and processes. The last three categories are much narrower and more restricted than the first four. By focusing exclusively on statements, decisions, and processes their impact is never known. This is akin to knowing all about the workings of an internal combustion engine without being aware that it can be used to drive an automobile or that an automobile if properly powered is more likely to bring greater pleasure

and safety than one that is either overpowered or underpowered.

The Dror book is essentially an elaborate investigation of process alone. His conceptual apparatus is generally clear, but it is not very useful in understanding anything about policy. As the title of his book makes clear, Dror is interested in "policymaking." His definition of "policy" is extremely limited and limiting: "public policy, in most cases, is primarily directed at government organs, and only intermediately or secondarily at other actors." (p. 15). He divorces the assessment of the "quality" of public policymaking from the "output" of policymaking. What he is concerned with is the process itself and whether, on the basis of a number of specific criteria, it is satisfactory. Output usually cannot be known and so the quality of the process is all that can be judged. This leads him to such conclusions as: "Compared with the past, public policymaking in all modern states is continually improving." (p. 101). The divorce of quality of process from quality of output and outcome leads to distorted results. If the quality of the process in the Pentagon rises, does it make any difference if the inhabitants thereof reach decisions that incinerate all of us? If the Departments of Housing and Urban Development and Health, Education, and Welfare evolve high quality procedures and yet the ghettos continue to disintegrate is this really good policymaking?

Dror properly asserts that "the significant output on which evaluation must focus is . . . its substantive effect on some real social situation." (p. 36). But he quickly concludes that such substantive effect cannot really be evaluated and so he turns his attention to evaluating process patterns, structural elements, inputs, and limited aspects of outputs—"nominal output" (that is, decisions as stated by the decision-makers), feasibility, and probable real output (a guess about what might happen).

Dror's efforts are useful is reminding us that the "process box" is still important in the study of policy. Their utility is highly limited, however, because he refuses to move outside the process box in any significant way.

Vernon Van Dyke, in his well argued essay in the Ranney book, summarizes an attractive line of argument about the scope of "policy studies":

> I have no criticism of the stress on process or of the accepted limits within which process is studied. The question is whether political scientists should not take a broader view of their tasks where policies are concerned—and I mean policies designed to have effects outside the governmental system itself as opposed to policies related to the governmental process. I believe that they should; not that every political scientist should accept a policy orientation for himself, but that the proportion of those who do should increase and that everyone should regard a policy orientation as legitimate and proper.
>
> The basis for the view is the proposition that our concern should be the promotion of human welfare. . . .
>
> Our concern should also be with the development of general knowledge, with theory, with science, but this proposition should not supersede the earlier one. It states an instrumental value, not the goal value. (pp. 36–37).

Lesson #2

Despite my approving quotation of Van Dyke, I think that in general it is not productive to worry endlessly over the "proper" role of the political scientist in relation to policy. These volumes are filled with numerous, and varying, self-conscious statements about the details of the political scientist's commitment to policy studies. Surely, broad statements, such as the one just quoted from Van Dyke, are useful. Hopefully, all political scientists could agree to the stipulation that ignorance of policy issues is no longer necessary (as it once was widely, although not universally, assumed to be) in order to maintain "scientific" purity. Indeed, I hope that the converse would now be acceptable to most political scientists: ignorance of policy issues is likely to impede scientific progress in the discipline. The essay by Lucian Pye in the Ranney book argues both propositions convincingly.

But beyond these general kinds of statements, detailed agonizing leads to more confusion than clarification. Lincoln Bloomfield's attempt (in the Ranney book) to dichotomize the world of scholarship and the world of policy serves as an example. At this stage in the development of the discipline I think it is more useful to judge a series of individual relationships between scholarship and policy than to detail a set of rigid boundaries beyond which the political scientist may not stray. Salisbury's call for "critical pluralism" (p. 156) at this stage in the development of policy studies is persuasive to me.

Lesson #3

In some work, policy should be treated as an independent variable; in other work, the customary treatment of policy as a dependent variable may make more sense. Three essays in the Ranney volume (those by Salisbury, Rosenau, and Lewis Froman) argue for the utility of treating policy as an independent variable. Salis-

bury, for example, builds an extension of an earlier scheme proposed by Theodore Lowi for categorizing policies and predicting structural and even environmental variables by the initial act of categorization. Froman discusses a number of alternative schemes with his customary brevity and clarity. Rosenau stresses the utility of this approach in the foreign policy arena.

Another essay in the Ranney volume, by James Davis and Kenneth Dolbeare, does more than theorize about the utility of viewing policy as an independent variable; it actually reports some empirical work on draft policy in which the payoff can be seen. The authors explore the consequences of present policy and the likely consequences of alternatives. This is analytically sound and also allows them to make recommendations on how best to reach certain explicit and implicit values at which the present system presumably aims but cannot achieve.

Lesson #4

There is a particular necessity for the development and use of a "scientific consciousness" in studying policy. This includes, crucially, a belief that knowledge is cumulative. The phrase in quotation marks comes from the Rosenau essay, as does the explanation of its meaning: "Stated most succinctly, a scientific consciousness involves an automatic tendency to ask, 'Of what larger pattern is this behavior an instance?'" (p. 204). It involves the framing of questions in the form of hypotheses and a conscious use of different kinds of variables, the arrangement of which can be altered for purposes of both generating and answering interesting questions. Rosenau says that with only a few exceptions all of the literature on foreign policy lacks this consciousness.

Ideally, the scientific consciousness will appear full grown in work that considers the broad sweep of policy. But, in most instances, it is likely to emerge in bits and pieces. Rosenau complains of the highly limited utility of case studies in the foreign policy area and concludes that virtually none of them have been written by authors with a scientific consciousness. But perhaps there is hope even for the case study.

Lesson #5

Description and prescription are both legitimate enterprises in the study of policy. The prescription can be of specific values or purely instrumental, in which case any values will do. There are dangers in the prescriptive endeavor but there is also much to be gained.

Dror illustrates the dangers. He limits his models to the "instrumentally normative." "They do not state what the substantive values of a system should be, but instead show methods for increasing net output, whatever the values prescribing that output may be." He says that net real output cannot really be measured or known very often and, therefore, he is likely to have considerable trouble knowing if his normative suggestions really work. Thus he seems to be prescribing for government policy makers and is likely to be content if his suggestions are adopted and result in more activity that can be judged by his "secondary criteria" mentioned before, but almost never by his "primary criterion" of net output. He prescribes to attain "quality," and he says "quality is analytically and conceptually the same as the idea of net output" (p. 33). But "net output" can almost never be used in evaluating the policy process. In short, 1) quality must be prescribed, 2) quality equals net output, 3) net output (quality) can almost never be evaluated. He has no way to evaluate the results of his prescriptions. This undoubtedly gives him free rein in prescribing!

Within this unique framework Dror makes some prescriptive statements that are interesting: for example, "One very interesting feature of an optimal policymaking structure is that it should be rather redundant: the contributions to the various phases should duplicate and overlap each other." (p. 211). It is too bad that his own logic prevents a testing of the value of such a prescription. Many of Dror's recommendations lack freshness or interest, however. For example, he tells us that "High-quality manpower should be drawn into the public service." (p. 253) and "Optimal public policymaking requires senior civil servants who have a great deal of knowledge and skills needed for policymaking." (p. 255).

The Davis and Dolbeare essay best illustrates the benefits of prescription. Their careful discussion of the conditions under which prescription should be offered deserves careful attention. For example, they specify three ways in which a social scientist might choose among policy alternatives: "First, he might frankly declare what values he considers appropriate, and seek to defend their propriety in some way. . . . Second, he might assume various possible values alternatively, in effect leaving the final choice to others. . . . Third, he might so assiduously develop data and refine interpretations of causes and effects in the areas of his peculiar strength (conditions, means, by-products) that the range of value choices would be drastically narrowed and so sharply focused that recommendation would involve a minimum of value preference." (pp. 115–116). They take the third option them-

selves in prescribing in the military manpower field.

The whole policy area is only now starting to be mapped out by political scientists. It seems to me that we have here a unique opportunity to demonstrate our belief that knowledge really is cumulative. I hope that the development of policy studies does not repeat the intellectual history of some other portions of the discipline, in which every new author starts out with his own theory, many elements of which cannot be tested by his own empirical work and will probably never be tested by the empirical work of anyone else either. Thus, I hope that what is valuable in these two books will not be read, reviewed, and forgotten but will instead appear as integral parts of future work.

RANDALL B. RIPLEY
The Ohio State University

Political Order in Changing Societies. By SAMUEL P. HUNTINGTON. (New Haven: Yale University Press, 1968. Pp. 448. $12.50.)

In this new, and provocative set of essays, Mr. Huntington focuses attention on the phenomenon of political stability and on the factors that shape a stable political condition. He suggests that the degree of political order is regulated in large part by the relationship between the rate of institutional and organizational formation within the political system and the rate of social mobilization. He writes: "Just as economic development depends, in some measure, on the relation between investment and consumption, political order depends in part on the relation between the development of political institutions and the mobilization of new social forces into politics." (p. vii) It is this framework of analysis that serves to tie together the seven long essays making up this book.

Mr. Huntington's central thesis is, of course, well known to all who are acquainted with the literature of political development. In essence it argues that development and the resultant political order are obtained when institutional and organizational growth are *compatible* with the rate of social mobilization, the generation of new "social forces" and the resultant political participation. When the rate of social mobilization greatly surpasses the rate of institutional formation for a substantial period of time, the political system will not be able to cope with demands made upon it and "political decay" will set in. It is undesirable, therefore, that the rate of social mobilization exceed the rate of institutional formation, but on the other hand, it is equally important that it not lag far behind, for if it does modernization may well slow down and stop.

This framework is then used in Huntington's well known comparison of American and Western European political development. The author notes that compared to patterns in the political history of Western Europe, in the United States national political institutions were weaker and political participation grew larger, earlier. As a consequence, Huntington concludes that the United States has been less politically developed throughout its growth than the Western European countries have been at corresponding points. Our political system, Mr. Huntington suggests, has strong elements of a Tudor polity, brought here by Englishmen at the very time when their compatriots back home were getting ready to abandon that system.

In the rest of the volume Mr. Huntington is preoccupied mainly with two sets of problems. One set deals with situations where social mobilization overruns the institutional framework and the other set deals with situations where the institutional framework provides a high degree of resistance of the process of mobilization and the expansion of political participation. The first set of problems is treated in two essays: 1) An essay on revolution "the extreme case of the explosion of political participation," and 2) an essay examining the behavior of political systems operating with weak political institutions and organizations. In the latter, new groups mobilized by socio-economic change, struggle in the political arena, totally untamed by organizational and institutional constraints.

Two other chapters examine the difficulties in making a strong institutional framework give way to the new social forces created by social and economic modernization. The author explains in most interesting fashion the vicious cycle faced by absolute monarchs in traditional polities where the weak modernization that takes place has been paralleled by a concentration of political power in the hands of the monarchy, but where that very concentration makes it difficult for modernization to continue. This fascinating problem of the political "take off" has been the subject of a good deal of attention by other scholars concerned with political development and their findings also support Mr. Huntington's observations. The other piece deals with the problem of reformers maneuvering between strong existing institutional resistance to any change and the demand for change by the new social forces.

This book concludes with a chapter dealing with political parties. The author argues that parties are the key political institutions in politi-

cal development for it is they that primarily carry out the function of mobilization and organization and keep each one at the proper developmental distance from the other. It is this triple function that, for Huntington, embodies the very essence of political development.

The reader will find in this volume many new insights, hypotheses and typologies. The best in this volume are chapters 1 and 3 where Mr. Huntington develops the theoretical framework for the study of development and order and explores the difficulties in getting to self sustaining political growth in traditional polities.

As with any other major volume, one can find a number of petty annoyances and some more serious complaints. The chapters are too long. (The first is an exhausting 92 pages). There is no bibliography. Some readers will be disappointed by the fact that Mr. Huntington telegraphed his punch by publishing three of the seven chapters long before his book appeared. (One of the three, "Political Order and Political Decay," now has been substantially changed with new ideas and new data.) The author has not included a treatment of bureaucracy as a major institution of modernization and this is to be regretted, for such a treatment would have complemented the treatment of the political party. For if parties mobilize and organize men, bureaucracies mobilize and organize non human resources as well. While mobilization affected by parties is massive and undifferentiated, bureaucracies mobilize selectively and rationally. The different functions suggest why before social mobilization begins in earnest it is bureaucracies that are preeminent, while it is parties that become central during modernization and why with modernity bureaucracies return to the center of the stage managing both human and non human resources.

I should conclude with brief comments on the concepts of political development and political decay that Mr. Huntington has advanced in his previous work and in this book. In general I suggest that the theoretical model of political development advanced by Mr. Huntington is most useful in those cases where social mobilization is massive and non selective and the demand for participation is intense. It is much less useful when social mobilization has barely begun, or has not begun at all, for it seems absurd to talk of backward countries as developed because nothing is stirring and the political system is not under pressure it cannot handle. For these and for many other classes of cases, different conceptions of development seem to be needed.

My comment on the concept of political decay is necessarily equally brief. The crumbling of political institutions under pressure of new groups seeking to storm a political system is more than likely to create disorder. But disorder —even of the kind erosive of existing political institutions—may not always be an indicator of decay. The destruction of a political system gives a greater choice in the development of new institutions, and if these institutions are in fact developed it is questionable whether one ought to describe what has happened as decay. In other words whether "decay" takes place rests in part on whether the beginnings of new institutions can be identified. One suspects that the concept of "decay," at least in a small part, is a function of time.

One must certainly acknowledge Mr. Huntington's contribution. His concepts of political development represented—I think there is general agreement on this—a step forward on previous attempts to define the phenomena of modernization. And his concept of political decay at the least began to close a gap in the literature on development. Both concepts have been widely used. This pioneering volume, examining as it does the relation between development and stability, is an interesting and exciting addition to the literature. The interesting framework, the current urgency of the problem of order in countries at all levels of modernity, the fundamental nature of phenomena examined as well as the forthright argument, ought to attract to this new volume the thoughtful attention of political scientists and of that much larger audience concerned with the creation of political environments responsive to massively and rapidly changing needs.

The Impact of Negro Voting: The Role of the Vote in the Quest for Equality. By William R. Keech. (Chicago: Rand McNally, 1968. Pp. 113. $3.95.)

Americans tend to have an almost religious faith in the efficacy of voting. From colonial demands for "no taxation without representation" to the Progressive stress on direct democracy, the ballot has been seen as the basic means for the removal of social ills. Today, as black Americans demand fulfillment of the promise of equality, voting is again emphasized. As President Johnson asserted in signing the 1965 Voting Rights Act, "the vote is the most powerful instrument ever devised by man for breaking down injustice and destroying the terrible walls that imprison men because they are different from other men."

William Keech, of the University of North Carolina, is skeptical of these unquestioned as-

sertions. In this literate and carefully constructed study, he analyzes the real impact of the black vote in two communities, Durham, North Carolina and Tuskeegee, Alabama. Negroes began to register and vote in Durham in sizable numbers more than thiry years ago, and now constitute at least a fourth of the city electorate. Growth in the Negro electorate of Tuskegee began later, about the end of the second world war, but eventually led to a black majority on the voting rolls. In both communities, therefore, we can see the impact of a large body of voters and make temporal comparisons. Moreover, in both communities unusually favorable conditions existed for the exercise of political influence. The Negro population was relatively well-educated, potential leaders had independent economic bases, and efficient political organizations were able to deliver a solid black vote. Durham and Tuskeegee thus provide crucial tests of the impact of a large black electorate under relatively auspicious circumstances.

Keech uses longitudinal comparisons, simple quantitative data, and detailed examination of policy outputs to answer the questions, "What impact does voting have on Negro social and economic status? What concrete advantages result? Does the vote have an influence over the distribution of advantages that is separate from the influence of those social, economic and political factors that are associated with Negroes getting the vote in the first place?" No formal causal modeling is attempted, since there are only two cases at hand.

Following Matthews and Prothro, Keech sees considerable limits on the efficacy of the vote. He concludes, "The vote is a far more potent instrument for achieving legal justice than social justice. The gains I have found to be most susceptible to Negro voting have consistently been those which most clearly involved fair and just administration of existing laws. Social justice, however, demands more than this. It often demands changes in existing law. . . . If social justice demands the eradication of the effects of past discrimination, the vote is even less useful." (p. 106–7).

The specific findings show great variability in the effect of the vote. In Tuskeegee, little change in the status of blacks occurred even when they constituted 35–45% of the electorate. Only after the Supreme Court invalidated an outrageous gerrymander and Negroes became a voting majority were public policies affected. The effect then was considerable and dramatic, but the vote failed to protect the interests of a large and oppressed minority. As Keech wryly concludes, "Saying that votes bring fair treatment of Negroes in Tuskeegee is different only in degree from saying votes bring fair treatment of Jews in Tel Aviv." (p. 94). In Durham, changes attributable to the ballot do occur, but other improvements in the position of blacks are attributed to non-electoral methods, such as litigation, street demonstrations, sit-ins, boycotts, and federal intervention.

The black vote is found important in these instances: the election of city officials, the passage or defeat of local bond issues, cessation of police brutality, equal treatment in the courts, school construction, provision of public services such as fire protection, recreation and urban renewal, and appointments to public offices. (In Tuskeegee, these influences are found only after Negroes became a voting majority.) Electoral power is found to be of little or uncertain importance in code enforcement, street paving, garbage collection, welfare payments, unemployment compensation, compensatory policies to remove the effects of past discrimination and, most vitally, integration of schools and public facilities. In the integration of public accommodations, the vote is found important in the later period in Tuskeegee, but of secondary importance in Durham.

In reacting to democratic myths of the omnipotence of the vote, Keech may have overstated his case. In doubtful instances, his tendency is to minimize the effect of voting power. The ballot has not brought full equality to America, but the gains secured in Tuskeegee and Durham, as specified above, are substantively as well as symbolically important. The value of the vote can be best gauged by imagining how few of these gains would have been realized without the ballot. Only through the democratic force of numbers could blacks balance the advantages secured to whites by economic and social power. While full equality has not been achieved, the incremental changes attributable to voting have been in that direction.

Seeking to show the power of the vote in these particular circumstances, moreover, is an unusual severe test. The governmental authority of municipalities is severely limited, and cannot be affected in many cases by any voting group, white or black. Concentrating on the local level also slights the effect of the vote on the national government. Thus, federal intervention may have been crucial in securing nondiscrimination in public accommodations, but surely one reason for this intervention was the pressure of integrationist votes directed through the national civil rights movement. Furthermore, there are unusual limits to the power of black votes represented by their visibility, the intensity of white resistance, and the historical depth of the American racial problem. Keech does acknowledge

these points briefly, but he does not fully qualify his generalizations of the importance of the vote accordingly.

We must also recognize that the value of the vote is partially intangible, and cannot be completely found by assessment of specific policy outputs. Thus, methods such as street demonstrations gain potency partially because they are supported by potential electoral power. Another value of the vote is negative—it provides a means of defense and protection for groups. While it may not secure direct benefits, it can lead elites to refrain from imposing disadvantages. Acting under a rule of anticipated reactions, officials may regulate their own conduct even without specific demands by the enfranchised.

Keech's work remains a well-designed study, in which theory and data usefully interact. It provides a solid model for the teaching of social science method, and yields important empirical conclusions. In our present period of ideological research, it is a fine example of compassionate but objective scholarship.

Gulliver's Troubles, Or the Setting of American Foreign Policy. By STANLEY HOFFMANN. (New York: McGraw-Hill Book Company, 1968. Pp. 556. $11.95.)

In this large and ambitious book, Hoffmann attempts the conceptual integration of the external and internal restraints that impinge on American foreign policy. The study is concerned with American national purposes and with establishing "what the United States can or cannot do, given the kind of nation it is, in the kind of world we have. Purposes that go against the grain of a nation's deepest beliefs or habits, or against the grain of the world in which it is trying to fulfill such purposes, are not sound. Power at a nation's disposal ought to be used in full awareness of the external conditions that define which uses are productive and which are not, as well as of the domestic predispositions and institutions that channel national energies in certain directions or inhibit the country from applying them in other ways" (p. xiii).

In the first part of the book, Hoffmann examines the "grain of the world:" the contemporary international system is characterized by revolutionary dynamism, qualified or muted bipolarity, heterogeneous membership, and ideological clashes—making for an overall milieu which "is likely to be immoderate in ends and means" (p. 19). Hoffmann distinguishes between three related levels of the system, each of which exhibits different structural attributes. Most fundamentally, the system is bipolar in terms of the nuclear destruction the superpowers can unleash, but the very restraints imposed by the nuclear stalemate have given the nation-state a new lease on life and have allowed, on a second systemic level, the emergence of political polycentrism. Polycentrism, in turn, has encouraged the trend toward nuclear proliferation which lends a multipolar attribute to the third systemic level.

The peculiar national disabilities that make it so difficult for the United States to operate effectively in this system are treated in Parts II and III, which examine American national style and American institutions. The complexities that result from the intricate interdependence of the three layers of the contemporary international system would tax the skill, patience, and imagination of any nation. They are especially challenging to the United States because of a debilitating set of attitudes which stem from the American national style (a function of America's past and principles) and American governmental institutions. The major institutional problem is the dispersal of power among, as well as within, the elements of the governmental structure and bureaucracy. Deficiencies of foreign policy style are reflected in legalism, reliance on formulas, short-range planning, an engineering type of pragmatism, excessive optimism, a black-and-white image of the world, the conflict between quietism and activism and between the instinct of violence and the drive for harmony, and many other afflictions.

Bleak as this picture may be, we need not despair. American disabilities have worked well in the past—"the American style was admirably suited to the late 1940s and early 1950s" (p. 212)—and can be made to work again in the future. What kind of future international milieu to expect, and what role the United States should properly play in it, are the subject matter of Part IV, the concluding section of the book. Essentially, Hoffmann calls for a more modest American involvement in Europe ("a certain withdrawal") which would allow the emergence of a "European Europe," integrated along confederal lines and protected by a Franco-British nuclear umbrella under American and Soviet guarantee. The program is very similar to the Gaullist blueprint for Europe, purged of its most blatant nationalistic overtones. Aside from furthering the establishment of a harmonious Europe, a curtailment of the American role in Europe would have the additional advantage of freeing American resources for more urgent containment projects, such as the restraint of China. (Hoffmann believes, for example, that the primary question facing NATO today is "whether its members can agree on a policy in

the 'new' area of potential hot war, i.e., with China" (p. 461)). Hoffmann is critical of the over-reliance on military instruments of containment, but considers it "essential that the United States continue to resist the challenges of its enemies whenever they try to reap gains by using or threatening to use force across national borders; otherwise, revolutionary ideologies will have little incentive to become at least externally moderate" (p. 360). Hoffmann does not say how (or why) the ingrained deficiencies of American statecraft would qualify the United States for this global task.

There are many interesting and provocative insights in this book, and Hoffmann generally succeeds in portraying the complex interrelationships of world politics, especially in his fine discussion of the contemporary system in Chapter II. Yet the reader is left with a profound feeling of dissatisfaction and exasperation. Hoffmann tells us that his "own interests go in the direction of theory (in the rather loose and modest sense of a network of questions about the principal features of international relations, a systematic effort to understand its determinants and logic) rather than in the direction of policy," and that "one should not expect an apple tree to produce cherries—one should judge it by the quality of its apples" (p. xix). But aside from sketching systemic relationships on three levels Hoffmann provides little theory, even in a loose and modest sense, and instead we get a long discourse about the direction in which American policy should proceed. Hoffmann introduces only two major theoretical concepts—the distinction between moderate and revolutionary international systems and that between "possession" and "milieu" goals—and neither contributes substantially to the subsequent policy discussion. When it comes to a "systematic understanding of determinants" of the international system, which presumably requires a comprehensive discussion of basic factors, Hoffmann tells us with disarming modesty that although he is "interested in economic affairs" he is "quite incapable of making any worthwhile contribution in that domain—hence my decision to leave it out altogether" (p. xix). Hoffmann has a similar aversion to strategic-military matters, which receive only scant attention. This aversion is apparently based on Hoffmann's strong objections to "foreign-policy planning which suffers from that disease—extrapolation from the military or economic areas—[which] leads to overconcentration on discrete sectors or to elaboration of strategic doctrines reflecting a strangely bloodless universe" (p. 320). But the intrinsic importance to the analyst of military and economic matters is in no way diminished by objectionable thought processes they may have inspired. By ignoring specific economic and military-strategic relationships of the international system, it is Hoffmann's analytical universe which becomes "strangely bloodless" and overly cerebral.

One of the major flaws of the book stems from Hoffmann's vacillation over what analytical principles he should bring to bear on the subject matter. One would think that, for purposes of theory as well as practice, the analyst should aim for balanced judgments. Hoffmann, commenting on his criticisms of American foreign policy, makes it plain that this is not his intention: "to borrow a nice metaphor from André Gide, I was concerned with the lion's fleas, not with denying that there is a lion under the fleas" (p. 212). There is nothing wrong, of course, with a critically slanted, imaginative assessment of American foreign policy. But problems develop when an admittedly distorted and highly impressionistic portrayal is subsequently incorporated in an analytical framework whose implicit appeal is to standards of objectivity and plausibility. A portrayal which sees only warts may be appropriate for a critical tract, but it is not very helpful for theorists or policy analysts who presumably strive for a more realistic presentation of features. Hoffmann, who wants to be analyst and theorist as well as critic, does not fully appreciate and guard against the tensions between the intellectual attitudes that these different roles seem to engender. The result is a methodological potpourri. The three large narrative building blocks of the study—the discussion of the international system, of America's stylistic and institutional shortcomings, and of policy proposals—are so dissimilar in methodological assumptions and criteria for evaluation, that they resist conceptual integration and indicate the analyst's loss of control over his material. (This methodological imbalance is underlined by Hoffmann's disconcerting habit of either making the most sweeping assertions, as in his discussion of American national style, or hedging any analytical judgment with the most involuted qualifications, at times to the point of evasiveness.)

This jarring structural defect is the more unfortunate because the book, failing in its task of analytical integration, has not much else to offer. There is little new historical material or historical interpretation, the long list of alleged American disabilities is familiar even to undergraduates from their texts, and the policy proposals are of questionable value and appeal. Especially annoying is the methodological legerdemain with which Hoffmann handles the concept of national style. Understandably, he disavows the notion of national character since it

"has turned out to be of dubious validity" (p. 87), and he enumerates the similar objections that can be raised against the notion of national style, even though he proceeds to ignore them. (Here, as in several other instances, Hoffmann seems to believe that merely acknowledging conceptual difficulties will make them go away). Despite his protestations, Hoffmann's analytical method is in no way different from the highly impressionistic, organismic, and reified views of society that are typical of traditional national character studies. Since Hoffmann is primarily concerned with socio-psychological and intellectual shortcomings of American foreign policy, the 300-page discussion of American style and institutions skips along on the surface and never reaches into what Hoffmann calls the "blood and nerves of politics." The result is a strangely ethereal, almost dainty, view of the political process. Offering no linkage between socio-cultural abstractions and foreign-policy-making, Hoffmann seeks to reassure the reader by saying that "when we speak of 'America' in sweeping terms fit to infuriate social psychologists, we shall be using a short cut; we shall be talking about the beliefs, attitudes, and acts of those Americans who are responsible for and concerned with the nation's foreign affairs" (p. 89). But Hoffmann does not analyze decision-makers or opinion-makers in terms of American national shortcomings, and we are left guessing whether Dean Acheson is guilty of excessive optimism, whether Senator Fulbright entertains a black-and-white vision of the world, whether Curtis LeMay holds a utilitarian faith in rationality and harmony, or whether Adlai Stevenson felt a conflict between his instinct for violence and the drive for harmony.

Finally, the book is much too long. It may be that Hoffmann, freed from the discipline imposed by the essay, his usual format of writing, was tempted into a long excursion whose point of destination and avenues of approach were insufficiently charted. Those of us who like his essays will join in wishing him a speedy return home.

Politics and Policy: The Eisenhower, Kennedy, and Johnson Years. By JAMES L. SUNDQUIST (Washington, D.C.: The Brookings Institution, 1968. Pp. 560. $8.75.)

Speaking of the assassination of John Kennedy and the first three years of the Johnson Administration, James L. Sundquist asks the question: "Is the American system of government so constructed that it must depend upon tragedy and political happenstance to render it capable of responding decisively to the nation's problems?" The originality and care with which Sundquist pursues this problem make his study a significant contribution to the growing literature on policy-making in the United States. Indeed, it is fair to say that his effort to raise and research important policy questions make his book indispensable reading for anyone concerned with American national government.

Politics and Policy is two books in one. Part I of the book consists of case studies of six central domestic policy arenas during the Eisenhower, Kennedy and Johnson years. Separate chapters are devoted to fiscal and structural measures for dealing with the problems of unemployment, poverty, education, civil rights, medicare and the outdoor environment. In Part II the author analyzes the political institutions and processes which explain how these policy innovations originated, got stalled, compromised and, finally, enacted.

The case studies are good narrative accounts of the obstacles facing new federal programs and, like most case studies, their primary value is the exposition of the nuances of the decision-making process in Washington. Sundquist tells the story well, even though the plot is a little worn, and there is a great deal here for the beginning student of government. The chapters on unemployment, poverty and medicare are especially useful in this regard.

What distinguishes this book as an important one for political scientists is the author's attempt to analyze the 1953–1967 period as one in which Democratic activists, largely stymied in Congress, developed policy positions which: (a) differentiated the Democratic party clearly from the Republicans; (b) found wide approval among the general public; (c) received a mandate for enactment in the elections of the 1960's; and (d) were enacted by the majority party under the leadership of Kennedy and Johnson. Addressing himself to the responsible parties debate, the author describes his major thesis: "As it happened, the Democratic party in the 1950's and 1960's did exactly those things the Schattschneider committee said should be done and Herring said could not be expected. It *did* develop a program to which it committed itself—and which it put into effect after winning office." (p. 391)

Sundquist has little difficulty showing that in the 1950's the engine of change for national policy centered in and around Democratic activists on Capitol Hill. Activist Democrats, their interest group allies, the Democratic National Committee and the Democratic Advisory Council formed a policy-oriented subsystem which was

at odds with the Eisenhower Administration (as well as, many times, the Democratic leadership of Congress), which did organize policy alternatives, and which did come into its own in the 1960's. Yet the question remains, Was there a direct link between the activity of Democratic party elites, an issue-oriented electorate, and the policy outputs of the mid-1960's?

Relying on public opinion polls and electoral data, Sandquist tries to demonstrate that there was. Concurring with Key's argument in *The Responsible Electorate* that, among those voters who switch parties from election to election, policy attitudes count, he "attempts to go a step further to determine *which policy or program issues are most influential and to assign relative weights to them.*" (p. 435, italics added.) This is a tall order, and he is only partially successful in completing it. But even partial success on a venture this bold is worth careful consideration.

To show that the issues he examines in Part I made a difference in the electoral process, Sundquist devised an "index of relative pulling power" based upon party switchers in congressional elections. For example, among those who voted for Eisenhower in 1952 but wanted the Democrats to win their states's congressional seats in 1954, there were more defectors among those who saw unemployment as the most important problem facing the country than among those who stressed other problems. In this example the index shows an advantage to the Democrats (whose position on the issue was more popular) of 1.3 percent. Similar calculations are made for the other issues.

Given the relatively small differences in the percentages used, given the problem of sampling error, and given the recognized difficulty of controlling for the effects of party and SES variables this effort is not likely to go unchallenged by political scientists. The author, who is well aware of the problems but discounts them, indicates as much when he concludes that the 1954 Democratic gain from the unemployment issue "may have been something less than 1.3 percent but it was surely something more than zero." (p. 439.) Still, at the margins of the electorate and among switchers it is probably true that issues do count heavily, and Sandquist has made an interesting attempt to tell us how much.

The author is on firmer ground when he shows that the Democratic activists were far more successful in proposing popular domestic policies than were the Republicans with their anti-spending, anti-inflation appeals. Regardless of the mandate content of any particular election, Democratic activists led by Kennedy were committed to certain kinds of action in the early 1960's and they could point to broad public support for their objectives. Congress, of course, was a stumbling block, but Sundquist correctly notes that a great deal of legislation was either passed or about to pass before the 89th Congress completed the job. What is truly remarkable is not that 295 Democrats in the 89th Congress passed a lot of bills but that so much was passed in 1963-1964. The 88th and 89th congresses together marked the end of one period in domestic policy-making, and the author's account of this is the best one to date.

Throughout this book Sundquist draws heavily on his experience as an activist staff man on Capitol Hill and in the executive branch. He offers new insights into the policy-making process in Congress and the executive, he has a perceptive discussion of the "dual legislative process" which occurs first in the executive and then in Congress, and he avoids the trap of exaggerating the static or deadlocked features of the national policy-making process. Indeed, if anything he is more sanguine about change than most students of national politics.

Politics and Policy is much more than the armchair reflections of a former activist. It is an attempt to describe, analyze and evaluate the national policy-making process, including parties and the electorate. Except for an occasional tendency to accept the rationalizations of activist politicians at face value (e.g. Adlai Stevenson's claim that policy alternatives can only be made clear in Congress between presidential elections, p. 406), the author's analysis is firmly grounded on empirical data. Students of public policy may fault his stress on policy initiation and process to the neglect of assessing the impact of those policies on the intended beneficiaries, but for an over-view of the process few books can compare with this one.

JOHN F. MANLEY
University of Wisconsin

The United Nations Force in Cyprus. By JAMES A. STEGENGA. (Columbus: Ohio State University Press. 1968. Pp. 227. $6.25.)

Cyprus: Constitutionalism and Crisis Government. By STANLEY KYRIAKIDES. (Philadelphia: University of Pennsylvania Press, 1968. Pp. 212. $6.50.)

Between 1954–58, the United Nations was unable to adopt any resolution dealing with the substance of the Cyprus question. Then, in 1964, the UN Security Council suddenly became involved in Cyprus by recommending the dispatch to the island of a peace-keeping force on a voluntary basis for the organization's members. The two books reviewed deal, respectively, with the stimulus for this Security Council action and the organization's response to the stimulus. Both

are based on the assumption that past conflicts between Greeks and Turks, not past instances of their peaceful cohabitation—for instance during the Balkan wars and World War I—render wellnigh impossible any future cooperation between Greek and Turkish Cypriots on the island. Thus, implicitly or explicitly, they are pessimistic about the prospects of conciliation and a future settlement, incidentally bolstering the Turkish and British viewpoint on the Cyprus problem.

To start from the UN's positive response to the Cyprus question rather than from the stimulus of the Cyprus crisis of 1963. Mr. Stegenga's monograph, as Inis Claude observes in his foreword to it, is "as timely as a piece of research as one could wish," and a "first-rate case study." After a cursory introductory chapter about the background of the Cyprus question. Mr. Stegenga, by a careful perusal of primary published sources and judicious use of secondary materials analyses within the international context the establishment of UNFICYP, the third peace-keeping force the United Nations ever set up, as well as this force's operation. In his assessment of this peace-keeping force, he is careful to state that his appraisal is necessarily tentative, since the Cyprus question is still in flux. After speculating about possible alternatives to this action and asserting that this UN peace-keeping experiment should alert the world's statesmen "to this novel technique of abusing the world body" (with President Makarios being regarded as guilty of this alleged abuse) he tries to assess this force in terms of operational efficiency and of effectiveness. In terms of efficiency, he rates UNFICYP as excellent, but in terms of effectiveness, his verdict is judiciously mixed, yet leaning to the favorable. On the one hand, he holds that this force contributed to bringing about a truce; to reducing killing and violence; to restoring law and order, and a large measure of normal economic and social conditions throughout most of the island; and to relieving the British forces on the island which were ostensibly seeking to perform a peace-keeping function. Together with the United States pressure on Turkey, this force also helped avert a grave threat to Mediterranean and international peace.

On the other hand, Mr. Stegenga points out that UNFICYP is merely a holding operation, not an instrument for bringing about a settlement—with this latter function to be performed by mediator provided for in the relevant Security Council resolution which set up UNFICYP. By its very existence, this peace-keeping force is thus vulnerable to the charge that it may well be inhibiting a settlement "by helping to protect and consolidate an abnormal *status quo* and by reducing the sense of urgency on both sides." (p. 186).

Speculating in conclusion on the likely character of possible future UN peace-keeping forces, he believes that such forces "will be more similar to UNFICYP than to UNEF. . . ." For in a world in which internally significant outbreaks of violence will continue, the future peace-keeping forces are more likely to be law-and-order forces rather that border-patrol or barrier forces, such as UNEF.

An inexplicable omission from this otherwise excellent study is the lack of any analysis of the important status of forces agreement between the United Nations and the Republic of Cyprus, the host state, thanks to which this UN presence on the island became possible. And a tendency already alluded to—to blame President Makarios for the constitutional crisis that led to the international Cyprus crisis of 1963—mars, in this reviewer's opinion, this otherwise objective study, which maintains that the Cyprus Constitution of 1960 was quite unwieldy. Neither Mr. Stegenga nor Mr. Kyriakides for that matter, refers to the fact that, before President Markarios publicitly presented in 1963 his thirteen points for a revision of the Cyprus Constitution, he consulted the British High Commissioner in Nicosia, the late Sir Arthur Clark, whose attitude encouraged the President publicly to put forward these points, triggering an almost instant Turkish government negative response, even before Turkish Cypriot leaders had registered their own views on these proposals. Perfidious Albion, said some. Others perceived in this inconsistency, a conflict of views between the Colonial and the Foreign Office. Finally, a reading of the speeches in general debate of the Greek representatives to the eleventh, twelfth and thirteenth General Assemblies would have revealed that the Greek party to the dispute, in contrast to the Turkish party, already since 1956 had shown a special interest in the establishment of UN peace-keeping forces in general, having in mind contingencies of Turkish coercive action over Cyprus that would threaten international peace and security in the Eastern Mediterranean.

Mr. Kyriakides' book, sub-titled "Constitutionalism and Crisis Government," deals first, in its first two chapters with the historical backgroup of the Cyprus question. The monograph's core—Chapters, 3, 4, and 5—seeks to describe the major features of the Cyprus Constitution of 1960, its areas of built-in tension, and the crisis in Constitution and government of

1963—a crisis which has become almost a norm by this time, Chapter 6—entitled "Cyprus Dilemma"—deals with the involvement of Greece, Turkey, and Britain in the Cyprus question. And "What Prospects for Cyprus" constitutes the book's concluding chapter.

In spite of this admirable outline, and the relatively superior treatment of the core topic, Mr. Kyriakides' monograph will hardly live up to the statement contained in its foreword that it will remain "the best documented analysis for many years to come" of the Cyprus Constitutional question,—unless, of course, no other study on this topic will ever be published. Its bibliography of primary and secondary sources is indeed extensive, not selective, as is Mr. Stegenga's. It is however far from complete. For instance, it altogether omits three Greek Government *White Books* (issued in 1956 and 1958) which have an important bearing on the background of the Cyrpus Constitution, aside from being quite revelatory of the question's international political development. Oddly enough, too, this extensive bibliography omits the relevant Cyprus proceedings of the eleventh and twelfth General Assemblies, where the Cyprus question was exhaustively considered. A cursory perusal of these materials would have revealed that the very condition of a Cyprus Constitution—the establishment of Cyprus as an independent state—originated in the Kashmir-fevered mind of India's Krishna Menon at the ninth General Assembly in 1954.

But bibliographical gaps aside, Mr. Kyriakides' book has several other shortcomings of commission or omission. For instance, in his introductory chapter, ignoring the millet system of the Ottoman government, he ascribes the elevation of the Church by the "Porte" to the maladministration of the local pashas (p. 5). And, disregarding the analogies of *enosis* in the Ionian Islands and in Crete, he suggests that the demand of the Cyprus Church for *enosis* was "a systematic attempt to prevent the development of a distinct Cypriot personality." (p. 9) Other shortcomings were due to his regarding newspapers as primary sources. (p. viii).

In his core chapter on the Cyprus Constitution, Mr. Kyriakides fails to discuss the Joint Constitutional Commisson set up under the London Agreement of February 19, 1959. This Commission worked for almost a year in preparing the text of the Constitution of 1960, incorporating in it the provisions of the Basic Structure of the Republic of Cyprus agreed upon between Greece and Turkey at Zurich on February 11, 1959. Had he done so on the basis of available published materials, he would have shown how the tension that led to the Constitution's breakdown was quite evident already at its drafting stage.

Perhaps the most distinctive feature of Mr. Kyriakides' book is the public opinion survey he conducted in 1965 in Cyprus. This survey, conducted only among Greek Cypriots, revealed, first, that the majority of the respondents blamed the Zurich agreement and NATO as the main cause of the Cyprus crisis; second, that a plurality of the respondents considered independence as the most realistic solution to the Cyprus crisis; and, third, that a majority of the respondents considered *enosis* with Greece as the ideal solution. The apparent discrepancy between the second and third finding reveals that self-determination as another option under the category of "realistic" solutions, was regarded by the respondents as a means toward an end—*enosis*. It testifies to the influence of the Greek Cypriot leadership's Greek Cypriot public opinion. For since 1954, this leadership had dropped the slogan of *enosis* in favor of the slogan of "self-determination," which, unlike *enosis*, is embodied in the UN Charter (Article I, paragraph 2), thanks to the Soviet Delegation's efforts at the San Francisco Conference.

Mr. Kyriakides' other hypothesis-finding that both Greek and Turkish Cypriots had hardened their positions, would suggest that the two ethnic groups on the island were unable to understand each other better than they could understand, respectively, Greeks and Turks, i.e. that a common Cypriot consciousness, regardless of ethnic origin, religion, language, was not evident when this survey was made. Whether such a national Cypriot consciousness will ever develop, no one can tell. In the past, states have set up buffer states on territories in dispute, as did, for instance, Argentina and Brazil, with regard to Banda Oriental, now Uruguay. That Greece originally favored the whole island's annexation because of the desire for *enosis* of the majority of the island's inhabitants at a certain point in their history; that Turkey, too, (both authors forget this), originally wanted to annex the whole of Cyprus on the basis of a historical title or on grounds of geopolitics and strategic security, may be the best omen for the Republic's continued independence, in spite of George Ball's dictum to the effect that Cyprus was a piece of real estate with a great past and no future. From such continued independence and all the vested interests independence creates, a national Cypriot consciousness could eventually develop transforming the Greeks and Turks of Cyprus into Cypriots.

Hunter College STEPHEN XYDIS

The Spirit of Chinese Politics—A Psychocultural Study of the Authority Crisis in Political Development. By LUCIAN W. PYE. (Cambridge, M.I.T. Press, 1968, Pp. 255. $8.95.)

This is the most controversial book on China published in 1968. The author is a distinguished American political scientist whose work has been in the forefront of methodological innovation. The book therefore demands attention if not agreement.

Lucian Pye's previous publications have focused upon the problems of political culture, often emphasizing Southeast Asia. He now addresses himself to contemporary China in an "essay about the unique national and personality traits that have inspired and shaped Chinese political culture from the time of the Manchu's to the present rule of Mao Tse-tung." (pp. vii) His task "is to describe the constellation of sentiment and attitudes that we feel must have existed for the Chinese political system to have developed as it has." (pp. viii) "The central theme of this essay became the authority crisis in modernization and the problem of psychic aggression for a people whose traditional culture was uniquely designed to repress all manifestations of that basic human drive." (pp. xviii) To accomplish this task, Pye has chosen to write an essay, leaving the problem of data to others.

In brief the argument is as follows. China, spared the identity crisis of transitional systems, instead has faced the necessity for new forms of authority which will permit the Chinese to reassert their historical self-confidence and also provide the basis for a reorientation of the society. In Pye's view the traditional Chinese state was self-contained, with a high stress on hierarchy, and ideology, and the sovereign importance of self-cultivation. Once this system breaks down, the problem of controlling aggression complicates the process of establishing new forms of authority. The first five chapters of the book are a broad analysis of this argument in Chinese historical experience. When the Chinese persisted in a political style, after the reality had changed, they released a flood of emotion that is described as the discovery of "hate."

The argument than shifts to the psychological roots of the authority crisis. In Chapters Six and Seven, Pye confronts the Chinese family, its socialization pattern and particularly its authority images. This requires a consideration of feelings toward authority and an exploration of their origins and functions in the Chinese personality. Pye's analysis derives the Chinese authority feelings from an essential emphasis on filial piety, an absolute denial of the legitimacy of all forms of aggression, and the vision of a rigidly defined order of role relationships. These characteristics are then inculcated through family socialization that invokes shame as the mechanism.

From this historical and psychological analysis come the difficulties of will power, action, and organizational behavior which impedes development. Pye's illustration is a case study of the communes (which is easily the most interesting part of the book). The book concludes with an overall summary of China's problems of the future based upon the book's appraisal.

The reader may have reservations about this book from three different viewpoints. First of all, there is the problem of "national character" studies. In describing the modal value for a society it is not possible to ignore the distribution of the characteristic in the society. Professor Pye has not set about such a study here. But in other attempts to examine the distribution problem the results have undercut the usefulness of the concept. Given the problems of operationalizing such a theory, in the Chinese case this may well prove to be a major stumbling block. In addition, as Pye notes in Chapter Six, there is a constant shift between adult action and family setting. The problem, of course, is to establish the ties between adult performance and the child rearing patterns of the family. Results in such large studies as Torney and Hess *The Development of Political Attitudes in Children* (pp. 217–220) caution against overestimating the role of the family in transmitting such attitudes. Kent Geiger in his study of *The Soviet Family* makes a similar judgment. Though these are not studies of Chinese society, their direction is clear. Consequently while Professor Pye suggests an alternative vocabulary and an interesting perspective on adult behavior as contrasted with the terms of the organizational theorist or the rational choices of the economists, it is not clear that the individually oriented theories are meaningful when applied to a societal pattern.

A second level of analysis centers upon goals. The positive argument for modernization and development is inherent in Pye's work. It is not necessary for him to deal with all the definitional problems of the terms, but to judge the Chinese in terms of a "modern open society" (pp. 45) or to describe the Chinese Nationalist and Chinese Communist leadership as "half educated rulers and strong armed bullies" (pp. 39) is rhetorical and certainly not helpful to the appraisal. Furthermore, it might have been useful to discuss Chinese achievement in terms of stated Maoist goals rather than so heavily in terms of Western political science.

The third level that must be of concern is the view of China which seems to emerge. Here the stylistic language handicaps analysis of an argument and forces the reader to demur. This is of particular importance since much of the case rests upon the special nature of the Chinese in contrast to other transitional systems. Two examples will indicate the problem. On page 30

"Nowhere in Chinese politics do we have a frank acceptance of the fact that men may be crass and self-centered and that it is only prudent in designing public institutions to insist upon checks and balances and to provide objective rather than subjective restraints on the use of power."

In fact the Chinese bureacracy was filled with such procedures as the law of avoidance in the civil service and the retirement provisions for mourning. Offical Chinese credo did indeed stress the belief in natural goodness, but there were a variety of provisions to protect the system.

Another example from contemporary China occurs on pp. 118.

They (referring to the Communists) have needed leaders who can speak the language of revolution and who in their own lives are capable of carrying the spirit of revolution against parental authority to the point of direct confrontation. It is significant that a disproportionate number of the top leaders of Communist China had violent and even traumatic confrontations with their fathers.

The book then discusses Mao, Chu Teh and P'eng Te-huai. The reader must feel compelled to ask, "disproportionate compared to what,?" and how do we know or can we know that the confrontations were traumatic given the state of biographical art on China.

Pye's analysis depends upon the acceptance of his view of China. If one is compelled to deny or modify those views, what remains may be innovative ideas about psychological constraints in politics, perhaps the necessity to re-think or define assumptions, but not an explanation of Chinese politics.

Spending in the American States. By IRA SHARKANSKY. (Chicago: Rand McNally & Company, 1967. 170.)

One of the most fruitful bodies of empirical research in contemporary American political analysis has been the comparative analysis of policy outputs in the American states. From the standpoint of the systematic study of politics this research is noteworthy not only because of its substantive findings but also because it represents a pattern of systematic cummulative development not often found in political analysis.

Employing a comparative approach, a rough systems conceptualization, the statistical manipulation of readily quantifiable data, and focusing on public policies as outputs of state political systems, this body of research has investigated the relative impact of a variety of factors in determining what states do. One issoe that has assumed central focus in this research is the relative influence of political factors versus non-political environmental conditions in determining state activities. The early studies tended to conclude that economic and environmental factors were more influencial as independent variables than any of a wide variety of political factors. Some research, including the book under review here, suggest that broad generalization needs important qualifications.

Spending in the American States can be evaluated best in the context of this research. Ira Sharkansky has been one of the most prolific and creative contributors to comparative state analysis. The central question posed is, "Why do some of the American state governments spend more money than others?" Like most of the work in this field Sharkansky employs a correlational analysis of a number of political factors, environmental conditions, and state programs and expenditures to investigate this question. Measures of per capita state spending and changes in per capita spending over time are the major dependent variables used. The influence of the past, the impact of political and socio-economic characteristics, international affairs and the national economy, and regional affiliation of the states are successively analyzed in terms of how they affect state spending. State expenditures are then related to state services.

One of the major findings is that previous state spending is the most powerful independent variable related to per capita state spending. The amount of money a state spends per capita, relative to other states, at one point in time is very highly correlated with the relative amount of money it spent previously. These relationships remain strong even over a sixty-three year period. Sharkansky relates this finding to notions drawn from studies of financial decision-making and budgetary processes, that current budgets tend to be formulated around a base of the budget of the immediately preceding period.

Following the pattern of earlier studies, Sharkansky relates per capita state spending to a va-

riety of political and non-political factors. Most of the political variables are found to be of little importance. Unlike earlier studies, however, he finds that social-economic variables are not very highly associated with his measure of per capita spending. He explains this difference from other studies by his use of a measure based solely on money spent by the states. Measures used by others have tended to include both state and local expenditures. Poorer, less densely populated, and less industrialized states tend to rely more on state (rather than local) spending than do the wealthier, more heavily populated, and industrialized state. Thus, the wealthier state governments are not necessarily the highest per capita spenders. Previous spending, the state percentage of state-local expenditures, and local government expenditures are found to be the variables with the strongest independent relationships with the level of state spending.

The most intriguing findings are those relating state and local government spending to state services. Contrary to expectations, Sharkansky finds no consistent pattern of high per capita spenders having the most extensive public services. States that spent the most per capita do not necessarily pay the highest welfare benefits, have the most state parks, or the highest teacher-pupil ratio. Relationships here appear to be rather complex, and the author only scrapes the surface in explaining what his data suggest.

This book offers new and important insights into the correlates of state spending. Conceptually, methodologically, and substantively it adds to the body of comparative state analysis. Some of the findings are important—even though often puzzling and nonconclusive. Both those who have kept up with this line of research and those who are new to it can benefit from reading this book. There are new and challenging formulations and findings for the former, and enough review of earlier work and good discussion of the conceptualization of issues and statistical techniques for the latter.

The major shortcomings of this book—one that is common to much of the comparative state analysis—lie in the quality of explanation developed. The author sometimes seems to be really stretching to come up with plausible explanations for some of the findings. This reader finds some of the explanations offered less than convincing, and sometimes misleading.

For example, when confronted with the finding that expenditures for public welfare and education are less strongly associated with socio-economic measures than are other areas of spending, the author suggests that the lack of relationship in welfare spending may result from state ideological phenomena which very independently from economic, political, and governmental characteristics. This, obviously, does not explain very much. It seems to me that the cause of this non-relationship is the formulas for federal participation in the major state welfare programs. As I interpret the data used, the federal portion of welfare monies is included in the measure of state payments and expenditures. By and large federal participation in these programs is set up so that those states which give the smallest amounts of money to the largest number of people receive the highest share of what they spend from the federal government. States can rank high in the indices used by Sharkansky either by giving large sums of their own monies in large per recipient payments or by giving small payments to large numbers of people, maximizing the amount of money given out while keeping state contributions low. Thus, high ranking states in expenditures per capita include a combination of poorer states like New Mexico, Louisiana, and Arkansas for whom 65 to 74 percent of money spent for the welfare programs comes from the federal government, and wealthy states like California, Massachusetts, and New York which receive from one third to one half of the money they give out in welfare programs from Washington. Most likely it is this factor that accounts for the low statistical relationships mentioned above. When only state contributions are included the relationships are much closer to the expected ones, with wealthier states tending to spend more per capita.

Patterns of federal participation may also help account for some of the other relationships found. This may be one factor helping to account for the generally weak association found between spending and the quality of services provided by the states.

This book takes us some important steps further toward understanding the factors that influence state policy outputs. It also suggests how complex the analysis and explanations are. Despite the fine contributions of this work, however, this reader is struck by how far we still have to go in developing good explanatory theories of why states do the things they do. It is helpful to know that states which spent large sums of money last year spent large sums of money the year before and ten years ago, and that high spending states tend to be more centralized in the operation of governmental services; but it is still far from a satisfactory answer to the question of why some states spend more than others.

Korea: The Politics of the Vortex. By GREGORY HENDERSON. (Cambridge: Harvard University Press, 1968. Pp. 479. $11.95.)

In this provocative and seminal book, a seasoned observer of the Korean scene boldly sets forth his interpretation of Korean society and politics since the fourteenth century. At the same time, the author presents his "theory of the vortex" arguing, in essence, the disadvantages of hyper-integration. It is a penetrating and stimulating book that deserves a wide audience.

The theme of the book, "the politics of the vortex," is deceptively simple. Korea, being such a homogeneous and well-integrated society both in terms of ethnic make-up and culture, failed to develop any meaningful middle groups either in terms of vested interests, religious separations, basic policy differences or ideological divisions. Individuals are totally atomized as a result and the highly centralized state "the eye of the storm") became a "great vortex summoning men rapidly into it." "The atomized mass streaming toward power" is the essence of Henderson's theory. The ethnic and cultural homogeneity along with centralization are blamed for Korea's lack of liberal and innovational spirit, quarrelsome factionalism, and underdevelopment. With this theme, the author examines the traditional society, Korean politics between 1860 and the present, political culture, and the varieties of ways (political parties, communism, and the military) through which cohesion is sought.

I could not help admiring the author for his breadth of learning and his thoroughness in utilizing the existing body of knowledge about Korea. Although the author relied mostly on materials published in English, he has consulted a fair number of publications in both Japanese and Korean. In addition, he had added materials gathered from his first-hand observations during this stay of more than seven years in Korea as a U.S. Foreign Service Officer. While the author maintains uniformly high quality throughout the book, I found his expositions of "colonial totalitarianism (Ch. 4), the period of American military occupation (Ch. 5. "The Gates of Chaos"), and the military (Ch. 12) particularly illuminating.

Henderson's theory of the vortex, however, raises some important questions that need to be answered. Most scholars of Korea would agree that the vortex of the kind described by Henderson did indeed exist among the ruling class (but not the masses) of Korea, and the forces responsible for it still persist. But was it because the masses have been atomized, as Henderson asserts? Have the masses in Korea in fact been atomized? Would decentralization and the development of "meaningful middle groups" cure most of the ills of Korea?

Since Henderson's theory of the vortex is an adaptation of Kornhauser's theory of mass society (William Kornhauser, *The Politics of Mass Society,* 1959), we may approach these questions by exploring the question of whether such Confucian societies as Korea and China indeed fit into the model of mass society. (Henderson argues that China and Russia also fall in the category of mass society. p. 333)

Although Henderson chose to stress one aspect of Kornhauser's theory, i.e. the absence of the structure of intermediate groups between the family and the nation, Kornhauser gave considerable weight to the "psychological properties of mass society," i.e. *self-estrangement of the individual* who fails to receive support for a sense of his own worth because of lack of opportunity for participation in society. (Kornhauser, p. 108). Kornhauser argues further that "in pluralist society [where intermediary groups do exist] there are alternative loyalties (sanctuaries) which do not place the nonconformist outside the social pale" (p. 110). What this means is that intermediary groups were but one of the means to placate the sense of self-estrangement among the members of the society. The question to be raised here is whether the structure of intermediary groups is the only means of preventing alienation.

My answer to this question would be negative. While the individually oriented Western societies required intermediary groups to provide a sense of participation, Confucianism created a "subject culture" with detailed hierarchical norms which did not encourage the aspiration for participation among the masses. As long as the rulers enjoyed "the mandate of Heaven," the masses did not feel estranged, and they were not readily attracted to mass movements. No doubt a great number of the ruling *yangban* class felt frustrated because of their inability to obtain government appointments, but very few from this class demonstrated the nonconformist behavior of the estranged.

I would argue, therefore, that Korea and China do not fit into the mold of mass society, and, under diffused culture, the masses were not self-estranged or atomized. In other words, the masses cannot be atomized in a well-integrated society. The situation after the turn of the century when disintegrative forces were injected into Korea is, of course, another matter. The causes for the vortex must be sought in factors other than hyper-integration.

Henderson was close to negating his thesis when he discussed the preponderance of anomic violence between 1945 and 1948 under American

occupation. Anomic violence, it should be noted, is a characteristic feature of mass societies.

> The rise of anomic violence was the inevitable result . . . of the rushed urbanization, industrialization, and mobilization of 1937-1945, plus the economic collapse, population dislocations, and lack of leadership during the first year of Liberation. (p. 147).

In explaining why the Koreans were swept into the vortex of politics, Henderson rules out external influence and economic factors as secondary and rather unimportant. (" . . . external factors are for Korea and her internal courses of secondary importance." p. 7) But, can we not say that the extreme degree of centralization and factional struggles among the elites came about because there was a dearth of "political goods" caused in part by a series of foreign invasions? Future research in economic history may reveal the close connections between economic conditions and political behavior. Although Korea was under complete foreign control only rarely in its history, the effect of these occupations may have been larger than Henderson's assessment, particularly in the shaping of the social and political environment.

Thus I find the "theory of the vortex" rather unsettling. I also believe that the stress on the theory occasionally marred his otherwise superb analysis of Korean politics. However, one need not accept the theory of the vortex to learn from the book and enjoy it. It will be a long time before any work of such scope and magnitude will replace it.

BOOK NOTES

POLITICAL THEORY, HISTORY OF POLITICAL THOUGHT, AND METHODOLOGY

Politics and Experience: Essays Presented to Professor Michael Oakeshott On the Occasion of His Retirement. EDITED BY PRESTON KING AND B. C. PAREKH. (Cambridge: Cambridge University Press, 1968. Pp. 424. $11.50.)

Reviewing collections of essays in brief compass is always a difficult matter, particularly when the purpose of the collection is not primarily the exfoliation of a theme or topic but the honoring of a man of many interests and influences. Such is the case with this Michael Oakeshott *Festschrift,* containing as it does thirteen essays ranging from philosopher William Dray's exposition of Professor Oakeshott's philosophy of history to Dorothea Krook's contemplation of the *kibbutzim.*

If there is a common theme it is the consideration of politics in four dimensions, of politics in time, inspired by Oakeshott's life-long interest in human experience, tradition, and politics. Books of this sort are vaulable if readers find particular essays valuable. I found all of the essays interesting, but like, I suspect, a good many other Americans I found Sheldon Wolin's "Paradigms and political theories" most valuable.

Wolin takes as his point of departure the now well-known thesis of historian of science Thomas S. Kuhn in *The Structure of Scientific Revolutions.* While Kuhn's book has been widely discussed by political scientists, most notably in two recent APSA presidential addresses, what has not yet been understood is that the real relevance of Kuhn's book to political science is not so much what Kuhn says about the developmental patterns of various natural sciences, but the example of Kuhn's own style of analysis. Science, considered not as a slogan or a policy or a set of abstractions, but as a phenomenon in the real world is a human institution. In this sense—and Kuhn himself clearly understands this perfectly well—science compares to community and scientific activity to politics. Thus, the way a historian-philosopher of science examines the development of his kind of human institution can be instructive for political scientists in examining their kind. Professor Wolin here opens the door to this angle of understanding.

Wolin invites us to consider the great political theorists on the model of Kuhn's practitioners of "extraordinary" science—the creators of scientific paradigms—and the statesmen, jurists, lesser theorists, and citizens who follow the master's guidance as comparable to Kuhn's picture of the scientific community, the members of which practice "normal" science. Now it is of course quite possible to be picky about this imaginative analogy, but Wolin and Kuhn are surely as capable as you can I of listing the differences between political institutions and activities and scientific institutions and activities. Let us, however, resist the temptation to show off how much we already know, and try to learn something new instead.

What is crucial about Kuhn's analysis is that he (along with such other contemporary philosopher-

historians of science as Stephen Toulmin and the late Norwood Russell Hanson) sees science as a living, human activity and not as a doctrine. Understood as a feature of cultural evolution science is not *a* method to be put on or taken off like a costume, (or like the wearing of a particular hat, to invoke a more widely used image) but an activity of mankind developing in time. Wolin in effect says, "Yes, science is a human activity in time and so is politics; and what is more, both can be understood as paradigm inspired."

"My proposal," says Wolin, "is that we conceive of political society itself as a paradigm of an operative kind. From this viewpoint society would be envisaged as a coherent whole in the sense of its customary political practices, institutions, laws, structure of authority and citizenship, and operative beliefs being organised and interrelated." (p. 149) In a passage that should make a good deal of sense to students of political development Wolin suggests that, "In the natural course of its history a society undergoes changes which impose strains upon the existing paradigm. A society may find the paradigm being challenged directly, or it may experience difficulty in coping with the results of change. New social classes may have emerged; new economic relationships may have developed; or new racial or religious patterns may have appeared. In much the same way that a scientific community will seek to adjust its paradigm to account for 'novelty,' a political society will seek to adapt its system to the new developments brought by change." (p. 149)

What from this angle of analysis we are being invited to do is not to look around in the political science or social science literature to find a paradigm (considering therefore structural-functional analysis, systems theory, etc. as rival candidates), but to consider Kuhn's own analysis as a paradigm (or better perhaps the application of a paradigm) not for politics itself but for political science. Kuhn is not much interested in promulgating universal laws of "scientific behavior" in the style of the more conventional philosophers of science. On the contrary he like Toulmin and Hanson repeatedly denies the relevance of rigid "single use" conceptions of science. Kuhn's analysis unlike so much of behavioral science takes its lights not from Newtonian physics and its descendents but from evolutionary, developmental biology.

Wolin's essay pushes us toward the fundamental question: should we try to understand political activity and scientific activity on the model of universal law physics or should we see men as products of evolution developing through their unique cultural capacity the changing adaptive devices called politics and science? It is a question, I think, that Professor Oakeshott would approve of, and, I suspect, there is no more fundamental question for political science. The other essays raise related questions albeit from quite different perspectives. It is quite likely that you will find something of value.—THOMAS L. THORSON, *University of Toronto.*

Power and Discontent. By WILLIAM A. GAMSON. (Homewood, Ill.: The Dorsey Press, 1956, Pp. 208.)

In introducing his book, Gamson describes his effort as "a discursive essay, with fluid boundaries, on a subject of endless complexity." (p. VII). Judged within such a context, it is a stimulating piece of work.

The presentation grew out of the author's study of community conflict. Originally, it was to serve as a theoretical introduction to an empirical analysis since published.

Two conflicting "perspectives" on power and conflict, influence and social control, are explored. Both orientations are elaborated and an attempt is made to unite them.

The influence perspective focuses on partisans in conflict attempting to realize a proportionate share of social rewards. Gamson argues that the writers who employ this perspective—the Laswellions of *Who Gets What? When? How?* elite theorists, the competitive power school of political party analysts, Marxians, and class conflict theorists more generally—share basic assumptions, related enough to justify considering them as a group. These mutual concerns are the focus on actors, not systems; the attention given to the scope and strategy of conflict, rather than its regulation; and the potentially advantageous use of discontent (perceived as an opportunity for change as against a threat to social order). The extent to which these assumptions, in actuality, are fundamental to each of the schools of thought contained within the category needs elaboration. Also helpful, but less essential, would have been the permutations that occur in each school, assuming that there are basically identifiable and consistent subsidiary assumptions for each.

The social control orientation emphasizes conflict resolution and regulation in contrast to power accumulation. The focus is on systemic questions, and indeed this is one of its distinguishing features. Such problems assume importance as the achievement of collective goods, the integration of the system so as to achieve conflict management, and the characterization of discontent as an element of instability within the governing framework. Unifying concerns among those who employ this approach include the focus on the system or its agents, rather than actors within it; the attention devoted to the regulation of conflict, rather than its strategy or tactics; and the construction

of discontent as a problem in system management, rather than one of competitive attempts to direct influence. Parsons, Easton, and Smelser are employed to illustrate these contentions.

The integration of these points of view would appear to be a monumental job, one demanding a clear assertion of underlying assumptions, a development of the theoretical priorities of the proponents of the subcategorizations, and a clear definition of terms. Such a complete synthesis awaits to be done. Gamson concentrates primarily on a clarification of terminology and in stipulating the relationship between and overlap among concepts relevant to both orientations. In the process the author treats such questions as the links between authorities and partisans, the relevance of a sense of trust for political stability and group competitiveness, influence and its use, social control and the channeling of discontent, predictability and resource mobilization in influence attempts, and the implications of the ideas expressed for social change.

Gamson measures the effect of influence as the difference in probabilities between two estimates, the first being the outcome with no partisan pressure considered and the second being the addition of group action to the equation. If the exertion of influence stiffens opposition, leading to a less desirable outcome than would have been expected without partisan interference, then "negative" pressure has been exercised. Resources to be employed in the transaction process are bargaining elements controlled by the influencer and capable of being brought to bear on authorities. The cost of resources employed in such a manner refers to those committed in the bargaining process.

The book explores the various possibilities such assumptions can lead to in analyses, adding confounding variables such as the constraints and inducements that can be employed and the possibility of persuading authorities without introducing new factors into the situation.

The study emphasizes the arena of conflict more than the content of the issues contested. This focus appears particularly suggestive for indicating the parometers of theoretical efforts along these lines while avoiding the complications surrounding arguments of influence attribution and the resolution of single or sets of issues supported in varying degrees by influentials. The scope of influence relates to the areas in which resources can be applied.

Influence and other aspects of questions relating to bring pressure on decision-makers are conceptually clearer and the ideas better elaborated than those dealing with the problems relevant to authorities. While the latter are treated, the consistent emphasis is on the control aspects and binding decision-making as it relates to conflict management. One part of the presentation that would appear particularly rewarding, the prediction of influence attempts and their probable success, while imaginative, is rudimentary in development. If this approach could be clarified and its empirical referants better stipulated, the conceptual precision of the schema would be advanced and empirical testing would be possible, major steps toward a truly integrative theory.

The author's principal enthusiasm is for questions relating to the use of influence. His development of ideas contributing to this orientation is provocative. The treatment of concepts relevant to authoritative decision-making is narrower in focus and more conventional. Over-all, the book represents a rewarding exploratory attempt of synthesizing two conflicting approaches to the study of social concerns. This is not the final statement on the subject, and it does not pretend to be.—WILLIAM J. CROTTY, *Northwestern University.*

Simulation in the Study of Politics ED. BY WILLIAM D. COPLIN. (Chicago: Markham Publishing Company, 1968. Pp. 365. $10.95.)

At worst, this edited volume might be regarded as a non-book drawn from a conference that was a non-event organized to promote a non-method, which deserves a one word non-review: "nonsense." Such a reaction would give an indication of the scholarly isolation of simulation researchers and the prevasive view of simulation as a methodological fad, or even as a pseudo-scientific fraud. But it would unfairly snuff out a useful attempt to generate a more constructive critical dialogue. The original conference was conceived as a means for discussing and evaluating some of the current work on simulation models of social processes. A common focus was set which asked the contributors to describe the assumptions underlying the simulated environments within which human or computerized decision-makers operate. An organizational structure was devised with five substantive panels, each with a non-simulator discussant, plus a graduate student panel on developing simulations and a demonstration-run of Coplin's own World Politics Simulation, with a dual culmination of an overview by Harold Guetzkow, as grand discussant, of the five areas, but also extending on into other areas of political science, and of a discussion of the "policy" potential of this work in government. The purpose was to break down the barriers between substantive areas and between simulators and non-simulators. The formal organizational dialectic of conferences usually vanishes in the haze of the cocktail lounge, whose informal dialectic goes unrecorded, leaving only the papers and formal comments, to be revised at leisure and eventually published, as in the

present case. A non-event produces a non-book, to apply Hennessey's Rule, "with no structure, no development, no general argument, and no discernible substantive editing."

Coplin's short introduction and summary do not suffice as the analytical overview which is necessary to break down the substantive barriers, nor is there much exertion of editorial influence within substantive sections. Still, the stimulation of a generally good collection of papers, even if it is a non-book, serves a useful purpose. Even those whose eyes glaze at the sight of mathematical symbols and behavioral jargon should be able to get through most of the papers and any of the comments without discomfort or frustration. And while there is some substantive imbalance, most of the papers have a wide empirical focus and general theoretical relevance.

As for the case made for simulation research, this varies by area. In the first and longest section of the book, the two substantive papers discuss the Northwestern Inter-Nation Simulation (INS) and TEMPER, unquestionably the most influential simulations developed in international relations. Hayward Alker dutifully goes through the INS model in detail, although he admits that this is probably redundant. As it happens, a shorter rendition is also given by Harold Guetzkow, in an abridged and slightly updated earlier paper substituted for his conference comments as grand discussant. Alker concludes with a brief sketch of a possible underlying theory, and a final paragraph on possible empirical verification methods (whose bibliographical footnote is, alas, missing). While this is not up to Alker's usual standard, it is not the piano player that needs shooting, but the piano—the INS. Walter Clemens has much the same problem in his propositional analysis and critique of TEMPER, that "white elephant" of computer simulation developed for the Defense Department. As Kenneth Waltz points out in his comment, neither the simulation programs nor the "theories" they represent are really theories at all, and the simulations are "very expensive crystal balls," and just as sterile from an analytical standpoint.

Going further, Clemens questions the empirical validity of the assumptions listed in TEMPER's non-theory. TEMPER is locked into a "cold war" structure, making it even more of a curio. Morten Gorden, who helped develop TEMPER in, as he puts it, his "rash youth," candidly admits in his rejoinder to Clemens that "just as generals prepare to fight the last war, simulators may model the last reality." But was the contemporary diplomilitary wisdom upon which the INS and TEMPER were based *ever* empirically valid? While Clemens disposes of TEMPER, empirical validation is only briefly referred to by Alker and Guetzkow; but one of the studies mentioned, Richard Chadwirk's effectively demolishes both the claims for formal theoretical coherence and for empirical adequacy of INS "theory." The absence of a fuller treatment of this existing validation work detracts seriously from the value of this section of the book, and does little to allay the suspicions of non-simulators about the scientific legitimacy of simulation research in this area.

Happily, most of the remaining papers are superb. In the section on urban affairs, John Crecine's paper on municipal budgeting is a major methodological and substantive milestone, and the short comment by Ira Sharkansky is intelligent. The best paper for the general reader is Paul Ray and Richard Duke's discussion of gaming simulation, drawn from experience with their METRO simulation, a miniaturized world of a middle-sized metropolitan area. Ray and Duke make the point that partially computerized gaming simulations are not makeshift way-stations to completely computerized elegance, but complex experimental tools for the investigation of decision-making behavior. Gaming and computer simulation form complementary components of an integrated and comprehensive research approach, by which a more systematic theoretical and empirical attack can be made on large, complex realities. These two papers on urban affairs, and the excellent review by Howard Rosenthal of simulation in elite mass electoral research (unfortunately, conference comments by Philip Converse were not included in the book), and the report by Rufus Browning (a pose-conference addition) on his partially data-based computer simulation of political recruitment provide the real value of the book. Not only are the papers informative from a methodological point of view, but their substantive content deserves a wider attention among political scientists than has been the case up to now. Two of the student papers are included, one based on the Michigan election studies, by Coombs *fils*, Fried, and Rabinowitz, suggesting a modular approach to election simulation; and the other, by Ronald Brunner, discussing a phased branching design as a possible general framework for the simulation of political development. Finally, there is an interesting discussion by Charles Moore of the heuristic programming approach developed in the Carnegie Tech management science tradition of decision-making analysis, which, if not really simulation, does attempt to state empirically valid decision routines (HP's). In their comment, Meyer Zald and Rolf Schliewen query whether this rather "mentalistic" emphasis on verbalized decision routines does not ignore latent constraints, and also confine itself to routinized decision-making, thus missing the more important organizational phenomena, and perhaps even imposing decisional

phasing upon behavior through the way in which a decision is defined.

While I believe that non-simulators will learn something from this set of essays, I wonder if the simulators will. Computers are not magic theory machines which immaculately conceive Truth. Waltz ought not to be ignored, because he is not initiated into the mysteries, especially since these usually conceal a big speculative "fudge factor," as Ray and Duke point out. They also emphasize that the "man-machine interface" is the creative nexus of the simulation approach to the study of decision-making, and not just an unsatisfactory makeshift. In this regard, there is a naive belief that loading a gaming simulation down with rich detail makes it more "realistic." Even when this detail does not introduce the biases of some brand of conventional wisdom, it gets in the way of meaningful comparison of experimental results. Despite Harold Guetzkow's strictures to the contrary, gaming simulation is an *experimental* method. When there is no decent fieldwork source of empirical data, as is usually the case in micropolitics, complex experimentation utilizing simulated environments will necessarily have to provide the incubation phase of behavioral political science—CHARLES A. POWELL, *University of Southern California.*

Islamic Surveys: Islamic Political Thought. BY W. MONTGOMERY WATT. (Chicago: Aldine Publishing Company, 1969. Pp. 186. $4.75.)

Without much doubt, it can be stated that Islam is rapidly becoming a doctrine of world wide significance. The increasing interest in Islamic studies is both academic and political. Islam is the youngest of the great world religions originating in Arabia and founded by the prophet Muhammad with many features common to Judaism and Christianity. It is also a political force shaping the destinies of many millions in the Middle East and elsewhere who adhere to the Muslim way of life.

The author of this book is highly qualified to write on Islamic thought. Mr. Watt is a Professor of Arabic at Edinbrugh University, the editor of the series *Islamic Surveys,* and the author of two additional works in the series. His profound knowledge of the Arabic language and his familiarity with the Muslim world contribute to the crispness and clarity of his writing in this area.

The reader of *Islamic Political Thought* should note on the inside title page the subtitle *The Basic Concepts.* This is essential in order to appreciate why this broad topic is exposed in relatively few pages (129 pages of text). This reviewer gathered two fundamental impressions. First, it is a difficult book for a political scientist to review as it is essentially a collection of basic historical facts. Second, for someone already familiar with Islam, what Mr. Watt has to say is elementary. Perhaps this is the reason for the subtitle. For the reader not familiar with Islam, *Islamic Politic Thought* will serve as an excellent starting point.

The exposition of the basic concepts of Islamic political thought rest on the fundamental premise, which is the theme of the work, that in Islam religion and politics are inseperable. Consequently, the political events of the past, primarily during the life time of Muhammad and the early Caliphs (*Kulafa' al-rashidun*) constitute the roots of Islamic political conceptions since "the concepts implicit in men's practice are more important than the writings of political theorists." (p. x) The eleven chapters of the book adhere faithfully to this premise.

In describing the evolution of Islamic political practice, the author is meticulous about giving his English reader precise definitions of basic concepts and Arabic words. He is cautious in defining these terms within the cultural setting of the period. The early Islamic state in its political concepts was to a large extent based on the nature of the tribal pre-Islamic society and primarily on such concepts as the *umma* or the community, and *jihad* or 'holy war'. The early Islamic community "was essentially a federation of tribes," and the *jihad* was the extension of raid or razzia which was an important feature of the life of the nomads in the Arabian desert. (pp. 14–5) The raid in the Islamic state was based on a Quranic verse 5.35/9, "O believers, fear God . . . and strive in His way." The common interpretation of *jihad* is that it offered the non-Muslim the choice between Islam and the sword. It is important to note that this choice applied only to pagans, but not to Jews and Christians as they were part of the 'protected minority'—*ahl al-kitab*—(people of the Book), or people with a monotheistic religion.

Under Muhammad, the Islamic state retained its pre-Islamic structure. Mr. Watt points out that "Apart from being the Messanger of God, Muhammad was not superior to other clan chiefs." (p. 21) His relatively weak position began to change partly because of his victorious military expeditions (the battle of Badr in 624), and because after he went to Medina in 622 the religious and the political were increasingly combined as revealed by the political relevance of his preaching. The point is that the Islamic religion simply added another dimension to the solidarity of the pre-Islamic community.

Mr. Watt devotes most of the pages of his book to the early caliphate and the Umayyad and Abbasid dynasties. He does this for Islamic political theory first centered around the caliphate, its purposes and dimensions as argued by the jurists and

on the political events that led to the creation of the Umayyad and Abbasid dynasties. In this discussion of the first four successors of Muhammad, the author notes that these rightly guided caliphs (*Kulafa' al-rashidun*) are held in special standing by Sunnite Muslims. The author reiterates his theme that "It is hardly an exaggeration to say that Muslims normally express political theory in the form of history." (pp. 36–7) The important historical incident that gave rise to the Shi'ite sect and to much Islamic political theory was Mu'awiya's refusal to acknowledge Ali, the last of the *rashidun* as caliph. Such an acknowledgement was essential since the practice until that point had been the choice of a caliph by acclamation (*baya*) of the believers. This position taken by Mu'awiya, the governor of Syria, led to bloodshed between the supporters of the two men and their differences was finally subjected to an arbitration.

Mr. Watt does not go into any details concerning this very important event perhaps because a universally acceptable account of it is non-existent among Muslims. He merely concludes the historical fact that the arbitration was favorable to Mu'awiya who, after the death of Ali, inaugurated the Umayyad dynasty and with it the arguments regarding its legitimacy. The author goes on then to consider the nature of the Muslim community under the Umayyad dynasty and the Abb sid dynasty that followed. He centers his exposition on the organization of these dynasties including the expanded position of the ruler, the military, judicial, administrative and religious; on the expanded notion of the community that included non-Arab Muslims and particularly the influence of the Persians and Turks under the Abbasids; and the numerous political ideas developed by the various Shi'ite sects notably their concept of the *imam* (caliph) who must be a decendant of Ali. Mr. Watt excludes from his exposition any meaningful discussion of the ideas of Muslim philosophers such as al-Farabi on the grounds that "they did not appreciably affect the main stream of Islamic political activity." (p. 81) But in the last few pages of the book Mr. Watt, in an attempt to show how Islam adapts to the contemporary world, argues that adaptive changes have been affected by the ideas of philosophers such as al-Farabi and Avicenna and such theologians as al-Ashari. (p. 127) He also excludes from his discussion such recent reforms as Muhammad Abduh and Rashid Rida. Instead, Islamic *Political Thought* seems to be centered around the notion of the *umma* or community of all Muslims and what makes for its solidarity, that is, political events; and on the *Sharia* (The Divine Law) and Tradition as being the model of Islamic social and political life, that is, the political ideas. In smort the book is concerned with historical events and those political ideas that have been operative in the historical process.

The attentive reader will note that Mr. Watt is an extremely clear writer. He scratches below the surface primarily in his discussion of the Shi'ite ideas. The book is free from any typographical and transliteration errors. Although *Islamic Political Thought* is an elementary book on the subject, it is nevertheless a valuable contribution to the English literature on Islam.—Sami G. Hajjar, *University of Wyoming.*

General and Social Systems. By F. Kenneth Berrien. (New Brunswick: Rutgers University Press, 1968. Pp. 231. $9.00.)

Man's inhumanity to man is perhaps exceeded only by his inability to understand himself and others. Berrien's book aims at providing a tool for dealing with this inability by applying general systems theory (GST) to "self" and to groups. Although his major audience is intended to be "those psychologists concerned primarily with group phenomena" (p. vi), he attempts to construct a theory which "is a sumarized abstraction of phenomena running the gamut from cosmology and molecular physics to some references to international conflict'" (p. 188). Surely, the political scientist can fit himself somewhere in this endeavor! The important questions are: Where and Why?

I invite only *some* of my colleagues to fit themselves into the first major part of the book (Chapters II-V), in which Berrien deals with the major concepts of GST as he delineates definitions, assumptions, and propositions for use in the theoretical framework. These colleagues are those who are not familiar with GST and its intellectual foundations. For them, the introductory chapters provide an accurate, readable, and comprehensive treatment of the major concepts of GST and a thorough bibliographic picture of its high priests, most of whom are dutifully cited throughout the body of the text; indeed, the attached bibliography is itself worth the price of the book for the uninitiated.

For the political scientist who has gone through the literature of GST, these chapters can be passed over. They contain nothing "new," "fresh," and "original" as the publishers and Kenneth Boulding would have us believe. For example, Berrien's central concept—"primitive randomness evolves into organized complexity"—was articulated decades ago by Teilhard de Chardin; in the latter's *Phenomenon of Man* a theory of complexification was developed in which orderliness and complexity evolve from randomness. Teilhard analyzed this process in the universe from the point of view of the "within and the without" of things —a point of view not entirely dissimilar to Ber-

rien's discussion of the growth of systems as equivalent to "the expansion of a system in size in which all parts are functionally articulated" (p. 75). In addition, we need not read Berrien's discussion of the probabilistic conditions of systems (pp. 48–50; 201–202) to realize that the universe is neither determinate nor mechanistic. The statistical physicists Gibbs and Bolzmann discovered decades ago the probabilistic nature of the universe and developed the concept of entropy as a framework for its measurement. Norbert Wiener's *Cybernetics* ante-dates Berrien's work by two decades and contains a discussion of feedback, storage, and memory, as does Ross Ashby's *Introduction to Cybernetics*. Moreover, Ashby's *Design for a Brain* contains a discussion of stability and adaptation that is not only much earlier but also much better than Berrien's. Finally, von Bertalanffy's *General System Theory* said—again decades ago—much of what Berrien covers.

It is in Chapters VI-IX—the chapters dealing with the application of GST to social phenomena —that the value of the book and Berrien's genius lie. I invite *all* of my colleagues to fit themselves into the book here. I offer this invitation for two major reasons. First, Berrien's analysis of social phenomena is a good example of theory construction. His incorporation of definitions and assumptions into relational propositions which generate expectations with empirical relevance for a number of research areas in political science is significant: his discussion of norms and roles in Chapter VI has important implications for small-group behavior and for coalitions; his discussion of the all-important GNS/FA ratio in Chapter VII and of the concepts of growth and adaptation in Chapter VII and VIII have great relevance to organization theory and political development; and his discussion of conflict in Chapter IX permits reasoning about domestic and international violence. These sections are suggestive of a variety of relationships which can be formulated easily into warrantable generalizations for research.

The second major value of the book to political scientists lies in Berrien's recognition of *choice* as a probabilistic factor in social systems (p. 93). It seems to me that this recognition has an important implication for political science. Political scientists are accustomed to dealing with the concept of system in one of two distinct ways. The first way is for analysis; that is, one can look at *any* set of phenomena systemically by dividing those phenomena into two categories: variables (the constituent elements of the "system") and parameters (those elements that are "outside" the system and form its boundary). Hence there are analytical systems. Second, there are natural systems, such as molecular and biological systems, where relationships are concretized and provide a basis for reasoning by analogy about social systems.

But it seems that the probabilistic element of human choice gives rise to a third kind of system —artifactual systems, i.e., systems which are products of human choice. Thus artifactual systems are set up *to be* systems, and the interesting theoretical question here is: How do individuals cope with systems which they themselves create? A political system is an artifactual system aimed at facilitating the exercise of human choice. *The Federalist Papers* articulate the logic of one particular kind of artifactual system.

The recognition of artifactual systems bears two important consequences for research in political science, and Berrien helps us to understand them. The first is a shift in research focus, which I shall call constitutional decision making. Berrien discusses deoxyribose nucleic acides (DNA's) as determinants of system form. Could it be, as Berrien seems to indicate, that constitutional decision making functions as the societal counterpart of the DNA template (p. 134)? If so, then can we assume that the structural forms and growth of any artifactual system will necessarily be conditioned by its basic constitutional framework? This is an interesting implication in that studies focusing on political development dismiss constitutional decision making as irrelevant in the dynamics of structure-function in developing societies. The second is a shift in research strategy. Artifactual systems are subject to frequent step-level functions and to changes in parameter values. Conventional research designs usually are cross-sectional, largely as a result of the "correlation game" played by so many political scientists. This "game" can not take account of dynamic relationships over time. Hence Berrien advocates the adoption of longitudinal research designs which can assess variable relationships over time and sees two promising theoretical developments along this line (pp. 157–161): game models and computer simulation. Both developments are examples of what I have called artifactual systems; both permit of continuous instead of periodic, cross-sectional measurements; and both allow for the studying of "real" groups over time.

These are the major reasons why my colleagues should read this book. Each of them may find a deficiency in it, to be sure; for reasoning at high levels of abstraction may involve the thinker in the fallacies of reification and analogous extrapolation. But Berrien treads cautiously and is aware of the epistemological problems raised by GST. For this reason, he only asks of his readers to judge, not whether his theoretical structure is true or false, but whether it will be more or less useful to them in their reasoned inquiry about complicated human relationships. In my judgment, it is

an extremely useful tool for the political scientist bent on developing a theoretical competence in his field.—JOSEPH D. OLANDER, *University of Miami.*

Rousseau's Social Contract: An Interpretative Essay. By LESTER G. CROCKER. (Cleveland: The Press of Case Western Reserve University, 1968. Pp. 198. $6.95.)

Professor Crocker combines an impressive familiarity with Rousseau's writings and a polyglot awareness of the secondary literature with psychological criticism and notions of political philosophy to arrive at a novel interpretation of Rousseau as an "authoritarian personality" who anticipates "human engineering" and the "science of behavior." Unfortunately, none of these factors help him to present a convincing explanation of the *Social Contract.* Moreover, the numerous references to secondary studies break the unity of his thought and prevent ready comprehension.

The first chapter explains the historical and psychological setting of the *Social Contract.* Thus, the early works are said to portray Rousseau's first thoughts about man and society; these ideas are developed more fully in the middle period and applied to actual states in the later works. Crocker believes that Rousseau sought a special means of controlling men in all of his writings and finally endorsed authoritarian controls in the practical works. Rousseau's identification of a combat between reason and nature, man's need for a political leader, and the principle that the people are not to be trusted by statesmen is a result of psychological inadequacies according to Crocker: thus, feelings of inferiority prompted his prophetic tone, a deep-seated longing for order compelled him to construct a rigid value system, and the desire that men be independent is evidence of emotional instability.

Crocker is critical of the institutions set forth in the *Social-Contract* and the theories behind those institutions. That Rousseau's State is as self-denying as Sparta is a consequence of the social pact. The community's authority is paramount, and the alienation of liberty is complete because the illiberal conditions of the General Will swallow up individual freedom. Far from preserving man in the independence he enjoyed before society, the total civic participation demanded by popular sovereignty places total control over him. Finally, the passages on the legislator and civil religion convince Crocker that Rousseau sought to establish domination by an elite and to introduce thought control.

Although aware that Rousseau is not responsible for misinterpretations of his thought, Crocker nonetheless considers it worthwhile to identify its "implications and potentialities" by bracing its influences (where the thoughts "have taken root") and to deepen and strengthen his own conclusion by studying analogues ("to what the ideas may conceivably lead"). Rousseau's influence is thus traced to the aristocratic reactionaries, as well as to the radical extremists, of the French Revolution and to precursors of Marxism, as well as of Nazism. Crocker then seeks facile analogues in *Brave New World, 1984,* and *Walden II*—concluding that *all* of these parallel Rousseau's ideas by inventing new possibilities for exerting power over men and reflecting the attitudes of the "totalitarian mind."

Four characteristics of totalitarian democracy—charismatic guide or leader, ideal of community, goal of unanimity, techniques to mobilize and control popular opinion—found in Rousseau's social thought by Crocker persuade him it represents a classic example of such a regime. Moreover, Rousseau's personality is a classic example of the totalitarian mind because: his need for reassurance led him to retreat from reality and to insist on dogmatic certainty; he longed for lost innocence; he was an outsider in his society; and he had a psychological fixation on illusion and deception. Rousseau's political scheme is all the more repungnant to Crocker because it is apparently without limits: he does not count on laws to govern men—he wants to reshape them. Finally, the society of the *Social Contract* destroys the antithesis between liberty and authority by abolishing liberty.

The many problems in Crocker's interpretation prevent its acceptance. For instance, he identifies difficulties in Rousseau's goals without considering that Rousseau also recognized them; concern with Rousseau's possible psychological troubles replaces the investigation of serious philosophical issues (pp. 13–14, 28–29). Rousseau's ideas are often dismissed because they conflict with contemporary opinions; the premises of contemporary opinion apparently need not be investigated (pp. 34–35). To explore the meaning of one book, the *Social Contract,* Crocker treats all writings of Rousseau as equally valid; this method allows him to use letters and first drafts, not to mention works with entirely different purposes, in order to affirm his own questionable interpretation.

There are some errors of scholarship in the book. Despite a plethora of footnotes, Crocker often fails to reference citations from Rousseau or secondary authors (pp. 46–47, 50, 57, 62–63, note 51, note 53, and p. 92). Translations are sometimes inaccurate and complete clauses are often omitted (pp. 69, 70, 73, 74, 85, and 97). At other times, Rousseau is quoted out of context to defend Crocker's own interpretation (pp. 70-71, note 110, pp. 87, 88, 95–96, 176, and 178). Three misprints occur in references to the *Social Contract:* p. 75,

references should be to II, 7 and II, 12, paragraph 5; p. 176, reference should be to III, 15.

In sum, the advantages obtained from Crocker's familiarity with all of Rousseau's work and with his life, as well as from Crocker's ability to indicate the pitfalls into which other Rousseau scholars have fallen, do not compensate for the errors of interpretation resulting from his questionable psychological and unexamined political notions. Before the erudition of Professor Crocker can benefit students of Rousseau, a careful study of the *Social Contract*—a study explaining its purpose, its parts, and how they fit together—needs to be made. Then we will be able to judge what light the first draft, subsequent letters to close friends, and passages from other writings shed on the message of the *Social Contract*.—CHARLES E. BUTTERWORTH, *Federal City College*.

Some Conceptual Approaches to the Study of Modernization. By DAVID E. APTER. (Englewood Cliffs: Prentice-Hall, Inc., 1968. Pp. 380. $7.95; paper $4.95.)

During the past decade David Apter has been one of the major figures in the field of comparative politics and his insights into the study of modernization have influenced not only a whole generation of graduate students, but his peers as well. His early articles calling for the development of unambiguous concepts and empirical theory have been reprinted in a number of collections, as have some of his studies of bureaucracy and traditionalism in Ghana and Uganda. In 1965, Apter brought together much of his prior research in *The Politics of Modernization*. Because of the availability of Professor Apter's earlier work, it is very difficult to see the value of reprinting his articles once again in *Some Conceptual Approaches to the Study of Modernization;* although the collection does enable one to follow the intellectual development of Apter himself.

Two of the major topics discussed concern 1) the relative capabilities of different types of political systems to achieve modernization and 2) a general approach to the study of politics. In attempting to provide an answer to the question of the capability of various types of political systems to achieve modernization, Apter argues that "the modernization process creates such problems of coordination and control that 'democratic' political systems, in the usual sense of that term, are not very relevant." (p. 329) What is required is high control system with a political religion (ideology) that provides for some popular support.

"Modernization" for Apter represents the ability of a social system to innovate constantly without falling apart, including the innovation of beliefs about change and of social structures, and requires a "social framework that can provide the skills and knowledge necessary for living in a technologically advanced world." (p. 197). However, the entire modernization process implies the introduction of roles that originate in industrial society into a non-industrialized one (p. 302). Since the latter is incapable of satisfying the expectations of the occupants of the modernized roles, control problems arise that require restrictive and authoritarian solutions.

In his discussions of the problems of modernization, Apter introduces and refines his categorization of political systems according to two basic variables; authority and norms or values. Authority patterns can be hierarchial—i.e. authoritarian —or pyramidal—i.e. representative, while value systems are consummatory/sacred or instrumental. The four combinations of authority patterns and norms result in four basic types of political systems: 1) mobilization, 2) theocratic, 3) bureaucratic, and 4) reconciliation. In the short run, he argues, authoritarian systems are more effective in achieving modernization, but by their very nature they lead to losses of information about the rise of values opposed to those of the elite and to the increasing political significance of claims for interest representation—i.e. they increase the likelihood of revolution.

In the only selection written specifically for this volume, Apter attempts to develop "A Paradigm for Political Analysis." He hopes that by focusing on the problem of choice political scientists will be able to reintegrate their discipline. Laudable as his purposes may be, it is very unlikely that Apter's proposal to treat choice as a problem of authority in its normative, structural and behavioral dimensions will ever achieve its purpose. First of all, like much of the author's work, many of the ideas in the essay are neither clearly expressed nor fully developed. For example, what exactly does he mean when he says: "We need to establish boundaries for [political science] around authority and to treat choice as a program of authority in its *normative,* or moral dimension (embodying both its wider objects and obligations), its structural dimension (involving the patterns of social relationship and organization which, analytically defined, contain social life), and its *behavioral* dimension (including the selection between alternatives presented by the other two)." (p. 363). In spite of the lack of clarity of Apter's paradigm, it is evident that he is pointing to a significant—perhaps the most significant—problem in political science; namely, the increasing divergence between normative political theory and empirical studies of political behavior.

Toward the beginning of this review the question of the value of reprinting Apter's articles was posed, since so many of them are available elsewhere. Actually the volume represents much more

than a catalogue of the intellectual development of Apter; in some respects it represents the development of studies of modernization over the past decade—from the rather optimistic views concerning the applicability of democratic institutions in developing areas and the hope that a study of developmental politics, unencumbered by preconceptions based on American and European examples, would enable us to understand better the "fundamentals" of politics to a much more sober realization that "the political aspects of development are far more complex than they appeared to observers a decade or so ago." (p. 331).

In these articles Apter deals with a number of significant problems of political analysis—such as the role of ideas in politics, the diversity of the modernization process, the need to "retraditionalize" political systems, especially the necessity of adapting them to traditional values. However, many of these topics are merely referred to and Apter's insights into such phenomena as the development of a middle class are not fully developed.

As do most collections of articles, this volume suffers from constant repetition. For example, Apter's methodological framework is presented, with minor variations, in most of the articles. Editing of the original articles to reduce this repetition would have improved the readability of the book; however, this would probably have resulted in a new edition of *The Politics of Modernization*.—ROGER E. KANET, *The University of Kansas*.

From Pluralism to Collectivism: The Development of Harold Laski's Political Thought. By BERNARD ZYLSTRA. (Assen, The Netherlands: Van Gorcum & Co., 1968, Pp. 236. Hfl. 25, 90.)

One welcomes today an intellectual portrait of Harold Laski (1893–1950). His shifting perspective and the intensity of his internal debates are now reflected in the ferment of an entire discipline. As Zylstra shows, the early Laski argued against the myth of the sovereign state, advancing instead a radical pluralist conception in which the state is just one among many associations serving human needs and competing for citizen loyalty. He later reinstated the government as the single most important agency for promoting and protecting interests common to the entire society, viewing it now as an arena where multiple groups advance claims and, ideally, as an umpire with the ability to balance competing claims according to the dictates of distributive justice and public interest. Finally, after the Depression and the rise of Hitler, Laski adopted an increasingly Marxist interpretation of arrangements in Britain and the United States, calling for massive social change through militant political pressure.

Why the progressive radialization? From Zylstra's exposition we catch a glimpse of Laski's own explanation. Equality of opportunity for the development of personality consistently remained the fundamental, if vaguely defined, social criterion for Laski. His early formulation of the pluralist *ideal* afforded opportunity for individual development within voluntary associations while providing limits to arbitrary state action. But, shortly, Laski began to face "hard facts." Political pluralism operated *in practice* within the confines of an increasingly centralized corporate economy; even a socialist party in office "cannot help but be aware of the fairly narrow limits within which it may successfully maneuver, and the danger to which it is exposed if it embarks upon measures which disturb the 'confidence' of men of property" (Laski, 1947). Pluralism remained Laski's ideal, but until the economic preconditions for pluralism were established the existing political balance would consistently work to the disadvantage of broad segments of society. Only militant pressure from below could redress the existing imbalance; only the government, responsive to these pressures, could institute the needed legal changes. The government's role relative to all other associations must expand appreciably to reduce economic inequality, and thus existing pluralist practice must (temporarily?) suffer while its proper preconditions are established.

"When Zylstra, though, seeks to explain Laski's radicalization, he traces the source to Laski's "apostate" secularism, especially to his ideal of social equality. Equality, Zylstra argues with some cogency, must have "qualifying reservations" if it is to be a viable political norm. There must also be some external authority to limit the role of the state if we are to avoid, as he thinks Laski does not, unintentional avowal of a totalitarian idelogy. Only one authentic basis is available: "No political ideal—whether that be equality, freedom, or the public good—can be a safe guide in the direction of the affairs of state unless it is subjected to the inner structural principle of the body politic, founded on the divine order of creation. Without this norm political reflection and action tend to fall into absolutization of either the individual or the community." This central postulate is asserted with vigor but defended with diffidence.

Zylstra's book moves on two levels. On the first we find a useful exposition of Laski's intellectual development and an insightful, but often overstated, critique of Laski's egalitarianism. On the second, we are told that Laski's "failure" exemplifies fundamental deficiencies in the entire secular tradition. Ignoring consideration of the social and economic conditions of pluralist politics (a central concern of Laski's), Zylstra concludes that pluralism must succumb to "autarkic" individualism or oppressive collectivism unless the "cosmonmic"

perspective is employed to "delimit" thought and practice. The latter argument, in my view, is hardly persuasive. Even if it were socially feasible to retinstate the "cosmonomic" view, its adoption would alter the style and unexamined bias of contemporary debates more than it would advance their rationality.—WILLIAM E. CONNOLLY, *University of Massachusetts, Amherst.*

The Political Sciences: the General Principles of Selection in Social Science and History. By HUGH STRETTON. (London: Routledge and Kegan Paul, 1969. Pp. 434. £ 2-15-0.)

This is a "study of just what valuations do and how they do it" in the social sciences. By "valuations" the author means not only good-bad valuations, but also (and indeed more so) important-unimportant, significant-insignificant, relevant-irrelevant valuations. Hence his subtitle; for he is concerned with the selection of a subject for investigation because it is judged to be important, of a piece of evidence because it is deemed to be relevant, of an objection to an explanation because it is judged to be significant.

These are his terms of reference. Within them, what is his thesis? He contends that the field of value has no limits, or, to put it in another way, that it is not possible to be value-free, in history or the social sciences or anywhere else. Therefore, to opt for "a value-free social science" is not to opt out of all values; it is to opt for a particular set of values. Moreover, Stretton asserts, the set of values chosen is bad in two distinct ways: it is bad technically, in that it has a built-in bias toward certain kinds of explanation, irrespective of their appropriateness to the subject, and blinds the investigator to other kinds of explanation by training him to ignore them; and it is bad morally, for the values that are inculcated are bad values. The second (and less important) of these objections has two parts: an objection that

"to teach students that their morals are extra-curricular is to deny those morals the very service which education and research should give them,"

and that, since values are inescapable,

"moral awareness had better be built into the process of research itself; which need be no more obscurantist than laboratory rules about safety or painless vivisection";

and an objection (likely to be quoted by hostile reviewers as a sample of Stretton's offensiveness) that the absence of such built-in moral awareness produces "professionally irresponsible skill for sale to the highest bidders." The second of these objections is less well argued than the first, and, while it could be detached without affecting any other part of his argument, its inclusion may reduce Stretton's chances of a hearing for his more central points. Even the first objection, though argued much more persuasively, is a detachable digression in what is essentially a book about the *technical* effects of value on *selection* in the social sciences. It is important to note, though, that Stretton rejects *Verstehen* arguments, not only of Croce and Collingwood, but even of Berlin and Winch, that all genuine study of society is understanding and valuing and nothing else.

For such an uncompromising book, it is remarkably free from straw men. Stretton asserts, for instance, that "strict behaviorism has few champions left." None the less,

"social scientists keep trying to exclude (values) by increasingly curious principles of selection,"

for

"a rule that for every effect, causes should be chosen for proximity, weight, and certain knowability . . . is always stupid."

Because

"moral abstinence, besides being a moral act like any other, often does serious *technical* damage to explanations by excluding many of their technically important parts,"

and has been linked, he says, with

"a revival, with new terminology, of some very old explanatory systems, especially single-factor systems."

No improvement is possible, if Stretton is right, through increasing professionalism, for the academic social scientist enjoys no great advantages, and suffers some serious handicaps, by comparison with more committed persuaders, who are

"prepared to stake more . . . on the truth and sufficiency of (their) knowledge. Its truth and sufficiency, moreover, may be tested by judges more severe than the publishers, prescribers and promoters within the pure scientist's profession."

And we are offered the paradoxical corollaries that persuaders like Lenin and Hobson, though not so good (as social scientists) as men like Langer and Viner, are a necessary precondition for their existence as social scientists; that a combination of the care of the social scientist with the passion of the persuader could produce something which would be both better propaganda and better social science; and that the uncommitted director of an uncommitted social science foundation would economise his resources by employing committed, not uncommitted researchers.

In place of "irrational imitations of the forms of physical science," Stretton offers two models for imitation, one more familiar than the other: economics, and law. Economics, "the best social science,"

"has prospered as it forsook generality, deduction from simple psychological axioms, symmetrically unified theory, and the search for sufficient explanation, for more practical attention to the facts of life and more specialization of diverse models and theories to the diverse particulars of relations in life."

And law is "a neglected good example to other disciplines," in that the lawyer, for all his solid achievement in abstraction, generalization, and even prediction, is commendably flexible, and knows when to stop abstracting and generalizing and simplifying, and when

> "to complicate his laws; to abstract them less and limit them more precisely; to classify more detail in finer categories instead of dismissing more detail from fewer principles."

The thesis of any such book as this can be readily abstracted—if the author has explained himself clearly—and briefly stated. The book's usefulness, however, depends on how fully and well the argument supports these contentions. Stretton wryly refers his readers to the *Massachusetts Review,* (Autumn 1961),

> "where the footnote-checker will be rewarded by much of the argument of this present book in seven pages."

But he does his book less than justice, for the *argument* is precisely what we cannot get in seven pages. That is why, particularly on a subject like this, a long book is likely to be better than a short book, and a book by a single author (if he has the necessary range to write it) better than a collection of essays by several hands; and it is the reason why this book is likely to be a useful one, and why Part 3 is such an important part of it. For it is particularly in Part 3 that Stretton undertakes the kind of detailed and extended examination of individual books, without which it would be very difficult for him to explain precisely how he intended his general points to be applied. And if these books, "too complicated for summary and too good to deserve it, . . . would be a good reading list for a first course in social theory," then the same books, together with Stretton's critique of them, would be no bad basis for a graduate seminar in the social sciences or in any one of them. For it is a stimulating book, not in the vulgar sense in which that phrase is applied to abusive books likely to provoke counter-abuse, but in the sense of examining important questions fully enough to provoke still fuller examination of them.

This is not to deny the book's faults. It is not established, and it is not necessary to Stretton's argument to suggest, that particular economic explanations are chosen (always?) by economists to give support to a chosen economic "therapy," though it may often happen thus. Even if—and particularly if—it were always so, we would still want to know how economists come to fall in love with their chosen "therapy." Again, it is not necessary to his argument, and it is a misleading way of describing More's use of *Utopia,* to say that it was "desired however impractically," and "imagined *because* (my emphasis) desired." But above all, it is not necessary for his argument for him to throw down so many gauntlets. He need not begin his book by comparing "scientism" with "a cargo cult in Melanesia, invoking magical plenty whenever conventional production is scantiest," or end it with complaints that "scientistic" social scientists use their position to exclude from the profession all but the like-minded. Even where he is funny (as where he rephrases an excerpt in language more to his liking, and adds the note: *tr. H Stretton*), he may be needlessly imperiling the hearing of arguments that he considers most important to be heard.—E. D. WATT, *London School of Economics.*

Sarvodaya: A Political and Economic Study. By ADI H. DOCTOR. (New York: Taplinger Publishing Co., 1968. Pp. 229. $6.25.)

"Sarvodaya," a Sanskrit word literally meaning "the rise of all," was given currency by Gandhi during India's independence movement. He used it to designate his political and economic thinking and techniques. Later his disciple, Vinoba Bhave, adopted the term to refer to the Bhoodan and Gramdan movements.

Sarvodaya is hardly a logically consistent philosophy of political and economic life. Much of it was improvised by Gandhi to meet the challenge of changing circumstances. Adi Doctor, who teaches at Marathwada University in India and who wrote this work for his doctorate in 1964, must be given credit for making an admirable effort to lend coherence to what was not only unorganized but quite obviously unorganizable. Gandhi maintained that "he was less concerned with being consistent with what he had previously said, but more concerned with being consistent with truth as he saw it from time to time" (p. 153). Whether one is pursuaded or irritated by the rationality or irrationality of Dotor's subject, one cannot deny that he has presented in this slim volume an able and faithful interpretation of all that goes under the banner of *Sarvodaya.* Perhaps he has succeeded so well that he has given the appearance of order to contemplative chaos.

Doctor begins by giving us a description of Gandhi's vision of an ideal society, the Ramrajya. Here the author is on somewhat surer footing because we know Gandhi's premises and their logical extentions. But when Doctor returns to the real world and begins to deal with the specifics of achieving that ideal society, he loses his grip. By now, the reader knows only too well what objects Gandhi's ideal society should not have. What he does not grasp with any degree of clarity is how the absence of these objects can be brought about or lived with.

Briefly then, at the political level, *Sarvodaya* views governments as engines of violence. Vio-

lence must cease in Ramrajya. But who, one might ask, will make decisions in the absence of governments and how. Presumably in Ramrajya there will be no conflicts because each will have according to his need. Decisions will be based on unanimity should conflicts persist, and those making the decisions will be elected by the unanimity of all participating. Should anyone resist a unanimous decision, others will *Satyagrah* to bring about "voluntary" compliance by the resisting party.

At the economic level *Sarvodaya* perceives machines as instruments of indiscriminate exploitation of men and material. But, it may be said, even Gandhi used and advocated the use of the spinning wheel. Ah, *Sarvodaya* is "not opposed to all machines" (p. 80) as long as the benefits of machines "accrue evenly to all" (p. 79). How will that be, one might ask, given human nature? *Sarvodaya* proposes that nurture will take care of human nature. Educate men to minimize their needs because we live in a world of scarcity. Resources are more likely to be in equilibrium with needs if needs are minimal. There will be no residual frustration if these minimum needs are met. In the absence of frustration and no more needs to fulfill, people will share their excess possessions or hold them in trust for others and thus live in harmony with each other rather than in a state of perpetual competition and conflict.

Bhoodan movement, dedicated to the proposition that "Sab bhoomi Gopal ki" (all land belongs to Lord Gopal) and therefore to all men who are God's children, sought to bring about a redistribution of India's agricultural land. Those in possession of more land than they themselves could till gifted it to Vinoba Bhave, the leader of Bhoodan, who in turn distributed it among the landless. But the case studies cited by Doctor point out that a substantial portion of the gifted land either remained idle under its new owners or reverted back to its original owners. Among the probable causes, Doctor mentions no disposition for agriculture among the many who received the land—they rather remain landless laborers—and the lack of capital goods with which to cultivate. And as Doctor puts it, "The typical Indian village of today, is more often than not, torn asunder by factionalism and governed by narrow considerations of caste" (p. 163).

Is the *Sarvodaya* view of political and economic life then totally invalid for today's India? Perhaps not. Rationalization of poverty has always fascinated the poor for they must live with their poverty. It may be many generations before India even approximates the material prosperity of the Western world. For these generations in waiting, *Sarvodaya* has a message, marvelously stated in the Bhagvadgita,

Advesta sarvbhutanam maitrah karun ev ch Nirmano nirhankarh samdukhsukh chami

(12th chapter, 13th sloka)

He who seeks Nirvana has no enemies for he is a friend to all beings; nor does he desire, for, to him, pain and pleasure are the same.

AMERICAN GOVERNMENT AND POLITICS

Frontiers of Judicial Research. By JOEL B. GROSSMAN AND JOSEPH TANENHAUS, editors. (New York: John Wiley and Sons, Inc., 1969. Pp. 492. $14.95.)

The twelve research papers which make up this book were presented at a conference held at the University of Iowa in October, 1967, supported by a fund honoring Benjamin F. Shambaugh, a past President of the American Political Science Association. What the organizers of the conference did, in effect, was to bring together a group of interesting, productive scholars and give them the opportunity of setting forth in tentative fashion their current research interests. It is of course not to be expected that each of these projects constitutes a "research frontier" in any meaningful sense. Several of the papers are truly innovative in theoretical or methodological terms. Several constitute progress reports on major ongoing projects, while others describe completed research. The comments which follow are necessarily highly selective. This is an important collection, and those concerned with judicial behavior will certainly wish to consult it directly.

Three of the papers will be of special interest to methodologists. Grunbaum presents a model of Supreme Court decision-making based on simulation techniques. The model is intended to incorporate both attitudinal and *stare decisis* considerations, and employs a combination of independent and conditional probabilities.

Schubert's study of the Australian High Court introduces smallest space analysis—"a new multidimensional scaling approach which is particularly appropriate to the investigation of matrices of agreement scores that reflect weaker than interval measurement." Smallest space analysis allows Schubert to investigate asymmetrical matrices, he compares matrices based on both opinion and voting data. His comparison of voting agreement in split decisions and opinion agreement in unanimous decisions led to the conclusion that the same

two attitudinal scales are components of both voting and opinion behavior. It should be noted that Schubert deals only with patterns of opinion *agreement*, and that other aspects of judicial opinions may manifest different political behavior.

Ulmer employs the discriminant function to explain Justice Frankfurter's civil liberties decisions. He treats cases as complex stimuli which flash different signs to different people. To avoid the claim that the signs with which judicial votes are correlated are subjective responses by the Justices, Ulmer derives them exclusively from lower court records and the briefs. On the basis of six extra-legal signs so derived, he was able to explain Frankfurter's votes in 83.8% of the civil liberties cases of 1959–1960.

In recent years it has become increasingly fashionable to study non-American judicial systems. Four of the papers in this volume are so directed: Schubert's work in Australia, Danelski's study of the Japanese Supreme Court, Kommers' paper on the West German Federal Constitutional Court, and Morrison's study of the Swiss Federal Court. The thrust of contemporary scholarship in the field of comparative politics is obviously non-institutional, and it will be interesting to see whether truly comparative cross-national studies can be developed by scholars who are oriented towards specific institutions. For example, Morrison demonstrates that the Federal Court is not a significant factor in the Swiss political process. This would appear to be the end of comparative *judicial* analysis. But his finding suggests a host of questions to the student of comparative politics, more broadly defined.

Danelski and Kommers report that one factor inhibiting the development of a strong judicial role in Japan and Germany, despite Constitutional provisions creating judicial review, is the widespread realization that the courts are in face political bodies. It is interesting to ask whether a judiciary can develop sufficient legitimacy to permit it to play an active part in politics in an age of legal realism. Perhaps popular belief in "legal magic" is a necessary pre-condition of effective judicial review.

The impact of legal realism on American state judges is discussed by Vines in the one truly comparative analysis in the book. His study of judicial role perception—based on interviews with 26 of the 28 justices of the supreme courts of Louisiana, Massachusetts, New Jersey, and Pennsylvania—takes the theoretical orientation of Wahlke's *Legislative System*. Vines demonstrates that more than half of the justices define their roles in terms of "law-interpreter" rather than "law maker" and that they minimize their policy making function. While there are considerable differences in the role perceptions of judges in different states, these differences do not seem to be related to the method of judicial selection, political party affiliation, or the ideological content of the judges' opinions and voting patterns.

Vines' research opens a wide range of questions. What are the sources of differing judicial role perceptions? Do judges differ from other political elites in this regard? Does the general public—as measured in Murphy and Tanenhaus' groundbreaking study, parts of which are reported in this volume—perceive the role of the judiciary in different terms than do the judges? What effect does this have on the Supreme Court's ability to manage the judicial bureaucracy?

Dolbeare convincingly demonstrates the necessity of directing systematic attention to the actual impact of judicial decisions on public policy, and he has begun to lay the groundwork for such a study. Of particular interest are his comparisons of state and federal courts in terms of the "output-impact focus." State and federal courts are used by litigants with different policy orientations; their impact on public policy differs in important respects; and federal courts are less fully integrated into the urban policy process than are state courts. Dolbeare may have overstated the case for a "bottom-up" view of the judicial system by emphasizing the small number of cases in which trial courts are reversed. Reversal by the Courts of Appeals in 9% of the cases considered may have been enough to keep the district judges "honest." We will need direct evidence from the trial judges before we can generalize about their awareness of hierarchical pressures.

One paper in the collection is seriously flawed. To test the hypothesis that experience with a court influences attitudes towards the judiciary, Jacob administered questionnaires to persons who had undergone bankruptcy or garnishment proceedings, and to a randomly selected control group. When comparing their responses, he treats *minute* differentials—differences as small as six tenths of one percentage point—as meaningful. Having explicitly rejected tests of statistical significance, Jacob makes no attempt to explain how he knows that differentials which appear trivial to the naked eye are of any interest. Contrary to his assertion, his data suggest that attitudinal differences between the debtors and the control group are related to differences in education, income and occupation.

Even more unfortunately, one of his basic conclusions is contradicted by his data. Jacob asserts that "those with experience in the courts felt less efficacious toward them than those without such experience." But data he presents in separate tables demonstrate that this is a half-truth. Those whose courtroom experience was in a garnishment proceeding do have lower scores on the judicial ef-

ficacy scale than does the control group. But in five out of eight categories, those whose courtroom experience was in bankruptcy proceedings score higher on the judicial efficacy scale than the control group, holding education, income and occupation constant. Thus Jacob's data support an alternative hypothesis: a "successful" (i.e.: bankruptcy) experience with a court increases one's feeling of efficacy toward it.

Finally, without detracting from the value of the Shambaugh Conference, one may question the utility of a volume such as this one as a mode of communication among scholars. The price of the book is such that only libraries and reviewers will own it. Research papers of this length could have been published as journal articles. Perhaps the latter course of action would have better served the scholarly community.—EDWARD N. BEISER, *Brown University*.

Organizing Men and Power: Patterns of Behavior and Line-Staff Models. By ROBERT T. GOLEMBIEWSKI. (Chicago: Rand McNally and Company, 1967. Pp. 277. $6.00, $3.50 paper.)

Robert Golembiewski's unusually prolific efforts in contributing to the literature of administration have continued to a point where a pattern is clearly discernible. Both the approach and objective of his work have remained rather consistent —he is derivative and synthetic in approach and his objective is to revise the practice of administration. His recent work on the problem of organizing the staff function in management bears the cut of this stamp in bold relief.

The theme of the book is straight forward—it is an argument for a "new concept" for the staff function—and it is organized generally to a format often employed by Golembiewski—critique of the concepts of the traditional theory (both conceptually and in terms of the contemporary realities of organization life), explication of the alternative concept, evidence on the effects (advantages) that accrue from its application in practice, and the place of the concept in "modern organization theory." The concept for staff role in the "traditional theory" Golembiewski self-descriptively dubs the NII (Neutral and Inferior Instrument) model and it is seen as increasingly unworkable as the pace and scope of change, size, and technological level characteristic of organizations increase. In addition, authority relations—and authority is of course *the* problem of the staff-line relationship—are changing in modern organizations, in the direction of being "less direct, arbitrary, and authoritarian. A number of (to use one of the author's terms) "minianalyses" covering specific aspects of organization and the management process are offered to make the argument in more detail—sources of line-staff tension in everyday operations and the tendency of the NII model to cause vertical fragmentation of activities which increasingly require horizontal integration with the growing interdependence of specialized parts in common flows of work.

With the defects of the NII model effectively demonstrated, Golembiewski then brings his alternative on stage: the "Colleague Concept." This concept is shaped to the objective of moving "away from unnecessary stress and repression, and this by maximizing the chances of horizontal integration." The structure which it implies emphasizes coequal cooperation of line and staff units through a "colleague group" and "unit team" structure. While the book notes that this concept is only an approximation, specific guidelines are offered for implementing the alternative approach as well as an extensive argument for its efficacy in reducing tensions and in yielding other beneficial side-effects. The analysis concludes with a description of how the "Colleague Concept" fits the new research on organizations—that it is consistent with the now famous "Theory Y" of management, fosters creativity, eases work stress, facilitates use of computers, and increases integration.

As was noted, this book is very much within the "Golembiewski genre," but it nonetheless diverges from this pattern in two important aspects. One of these is the emphasis on power in organizations—an emphasis which the author asserts was neglected in the traditional theory but is the "warp and woof of this analysis." This "emphasis" amounts to the assumption (made by our founding fathers in drafting the Constitution, see notes) that men are intrinsically both good and evil and possess an insatiable desire for power. The task for organization theory—specifically in designing line-staff relations—is to take these forces as given and make them work *for* instead of against organization purposes. By assuming this emphasis as a starting place, Golembiewski appears to move away (and thereby detracts) from a most important theme that formed a significant part of his contribution in *Men, Management, and Morality*. In that book (and even implicitly in the argument he makes here) the position is taken that the "nature" of men and hence the quality of their lives can to a significant extent be set by the structure of human organizations. This posture supports the normatively uplifting and positive view that people and life can be bettered and that men can perform a positive role in the improvement. And it further highlights the importance and relevance of the study of organizations in an organizational society. The tie-in Golembiewski makes to the founding fathers marks the nature and weakness of his basic assumption in supporting his analysis. It could be argued that it is the ethically ambivalent and somewhat pejorative view of the nature

of man reflected in our constitution which has in part resulted in the social and political crisis we are currently facing in the United States. The model of interpersonal relationships implied by the Colleague Concept assumes more of people than the "power orientation" allows. Indeed, it seems clear that if people are the way the "power orientation" view defines them, the colleague structure urged by Golembiewski would operate in a fashion characterized by growing power imbalance or instability, and oftentimes friction and stalemate.

Another difference of this book with much of the author's earlier work is a deficiency of creative synthesis. One of the strengths of his past work has been the ability to go beyond simple use of a wide range of existing research into both novel arguments and imaginative synthesis of fresh insights, conclusions, and implications. This book offers little of this rewarding stuff, save for brief notes such as those on the relation of staff-line structures to use of computers and to potential for creativity.

In fact, the College Concept is so close to the prescriptions clearly implied by the organization research existing when this book was written that it evokes somewhat the feeling, to use the style of its author, that a "house has been burned to roast the pig." This impression is reinforced by the informal, embellished, "bomb-the-point-home" style used to carry the argument—which seems to be an attempt to speak in ever so convincing terms to the practicing manager.

Because the content and tone of the argument tend so much in this direction, in turn, one finds as he nears the end of the book that two very large, old, and nagging questions have again surfaced in the midst of a treatise on administration. One of these questions concerns the serious and persistent gap between the "theory" (or study) of administration and its practice, and the other the proper definition of the relationship between the study of administration and political science—with its corollary concerning the practice of administration and the real world of politics.

Why is the theory-practice gap so persistent? We have known what Golembiewski told us in this book, at least by a general pattern of research findings, for a good while. The "traditional theory" has been whacked at from every corner of the field and long since put down and out in "modern organization theory." Why was a book written in 1967 which not only details an alternative approach to a significant management problem but in addition goes on to labor the underlying theoretical argument—and why does the reader feel, albeit somewhat uncomfortably, that the author needs to do thus? The answer, of course, is that our common experience tells us that the world is still being run in accord with the traditional theory. Golembiewski's strategy in confronting this problem is to reinterpret, reword, and sell the knowledge developed in the academic enterprise in the marketplace of management. At some point we must begin at least to wonder whether the basic problem of communicating to the world outside resides in the institutions and professional contexts within which this knowledge is developed—and that the only effective coping strategy is one which addresses the problem at this level.

The other question (administration, study and practice, and political science and politics) is posed in two ways. One is incidental to this book —the fact that the examples drawn and the data employed fall almost exclusively in the area of industrial manufacturing concerns—but the other is general. Given the fact that a central aspect of modern society is large scale, widespread organization, with deep consequences for our political system that are being noted by, among others, an increasing number of commentators on the pluralist technique, it could be asserted that a major mandate to those who are writing the contemporary administration literature is to tie their studies into this broader, immediate, and extremely important area of concern. This was accomplished in *Men, Management, and Morality* effortlessly and as a by-product. As Golembiewski shows, the staff junction problem is a major source of organizational ineffectiveness. Therefore in spite of the fact that his analysis is technical, relevance to the broader question of political viability is inherrent in it and should have been drawn. For this reason one would hope that in the future this author would move toward the direction of his earlier work, where relevance to political science and politics was clearer.—ORION WHITE, JR., *The University of Texas at Austin.*

Judicial Power and Reconstruction Politics. BY STANLEY I. KUTLER. (Chicago: The University of Chicago Press, 1968. Pp. 178. $5.95.)

To many casual and not-so-casual students of the American Political System, the Civil War and Reconstruction era finds the Supreme Court where Professor Kutler expected to find it when he began this study, at "the nadir of judicial power and influence." This volume of essays should mark the end of such an ill-conceived notion.

Professor Kutler securely identifies the judiciary as a participant in those extraordinary political times and much more of a citadel to be captured by the Republican Party, than an institution to be either ignored or destroyed. Professor Kutler lays bare the often delicate interplay of Court and Congress which provides us with a rare laboratory in which to examine the role and "toughness" of

the Court under stress during a period when politics was inflamed and polarized.
